INDEX OF CONTENTS.

JULY TO DECEMBER, 1891.

A

ABBEVILLE garden at, 127
 Aberystwith, the past winter at, 76
 Abies magnifica, 276; A. m. var. shastensis (the Shasta Red Fir), 430; A. Webbiana, female cone of, 395
 Aburi, Gold Coast, 69
 Abutilon Thompsoni, 619
 Abutilons for winter-flowering, 102
 Acacia trees in Egypt, 12
 Acampe madagascariensis, 608
 Acer insigne var. velutinum, 189; A. Trautvetteri, 189; A. Volxemii, 9, 188
 Actinidia Kolomicta, 402
 Adon Mount, Dulwich, 250
 Aërides Lawrencei, 160
 African Oil-Palm in Borneo, the, 423, 558
 Agave albicans, 739
 Agave, flowering of the American, 713
 Agricultural education, 106
 Agricultural education, an important experiment in, 520
 Agricultural Gazette of New South Wales, 69
 Air in woods, &c., hygienic value of, 400
 Alaskan forests, 732
 Aldenham House, Elstree, 608
 Allspice, Californian, 702
 Alwick Castle, 282
 Aloysia citriodora, hardiness of, 18
 Alpine plants, culture of, 451, 483, 548
 Alpines, sphagnum moss growing in, 36
 American flora at the World's Fair, 676; fruit evaporator, 53
 Analysis of White Globe Onion, 152
 Androsace lanuginosa, 144
 Anemones, Japanese, 368
 Angraecum eburneum, 710
 Anguloa, a new, 681
 Apiary, the, 38, 96, 164, 221, 277, 339, 427, 487, 550, 615, 673, 735 (see Bees)
 Apple and Pear growing, pyramidal, 731
 Apple avenue at Waltham Cross, 340; A. Chelmsford Wonder, 613; A. culture and orchards, 419; A. Jas. Grieve, 493; A. Lord Grosvenor, 405; scab, 580
 Apple, the chemistry of, 611, 733
 Apples, does it pay to grow? 190, 274
 Apples, Tasmanian, 736
 Apricots from seed, 377; Russian, 555
 Araucaria excelsa, 371
 Arisaema anomalum, 739
 Aristolochia grandiflora, 190; A. Duchartrei, 744
 Armeria Gaditana, 522
 Arnebia echinoides, 37
 Artichoke leaves, poison in, 522
 Artificial manuring, effects of, 586
 Arundina bambusifolia, 394
 Asparagus, experiments with, 243
 Assimilation in Lichens, 586

Asters at Eynsford, annual, 305
 August stocktaking, 372
 Auricula, Page's champion green-edged, 40; the, 19, 246, 761; A. Booth's Freedom, 40; A. Leigh's Colonel Taylor, 40
 Australian fruit imports, 400
 Autumn-flowering plants, 620
 Autumn in the Rose garden, 582
 Azalea mollis, 48; A. procumbens, 514

B

BABRAHAM Hall, 648
 Balfour, Isaac Bayley, 275
 Bamboo, seeding of, 93; B. Japanese, hardiness of, 70
 Bass or Piassava, 335
 Bee-keeping and County Councils, 136; law relating to, 142, 562 (see Apiary)
 Beet Spinach, 619
 Begonia, tuberous, with striped flowers, 400, 434; B. Weltoniensis, 619; B. John Heal and Winter Gem, 680; B. tuberous at Tring Park, 400; at Bower Ashton, 404
 Belgium, Orchid Culture in, 479
 Belladonna Lily, 397
 Berlin Botanic Garden, 96
 Begonia radicans, 527
 Birds of the commons and woodlands, 739, 758
 Black Currant wine, 141
 Blanching, 248
 Blight on Plums, 618
 Blue Michaelmas Daisies, 620
 Bocconia cordata, 619, 651, 679, 742
 Bohemia, the Plum harvest in, 431
 Bolbophyllum macranthum, 739
 Bolting of Cabbages, 18, 76, 140
 Bombay ferneries, 555; gardens, 143
 Bone-meal manures, 401
 Books, Mr. Hibberd's, 647
BOOKS, NOTICES OF:—A Handbook of British Commerce, &c. (P. L. Simmonds, F.L.S.), (London: Moffatt & Page), 706; Amateur Gardening, 765; Baillon's Histoire des Plantes, 75; Bankruptcy, The Law of, 766; Book of the Farm, 76; Botanical Magazine, 106, 107, 197; Botanisches Adressbuch, 15; British Edible Fungi: How to Distinguish, and how to Cook Them (M. C. Cook), 740; British Fungi—Phycomycetes and Ustilaginæ (G. Massee), 739; Bulletin de la Société Française d'Horticulture de Londres, 401; Bush Friends in Tasmania (Meredith), 402; Calvert's Mechanic's Almanack, 765; Catalogue of Vascular Plants of South Western France, 137; Cours d'Anglais (Alfred Legrand), 517; Dictionnaire de Botanique (Baillon), 251, 766; Evolution of Plants, Lower Forms (G. Massee), 740; Flora of China, 251; Förstliche Botanik (Frank Schwarz), 740; Fossil Botany (H. Graf zu Solms), 768; Garden Annual and Alma-

nack (W. Robinson), 738; Garden Craft, Old and New (J. Sedding), 555, 674; Gardeners' Magazine, The, 765; Glenn's Illustrated Garden Almanack, 765; Grape Growing for Amateurs (E. Molyneux), 281; Handbook of the Destructive Insects of Victoria, 371; Himalayan Journals, 765; How to Grow Onions, 40, 766; Horticultural Directory and Year-Book (Dr. Hogg), 738; Icones Plantarum, 107; Landscape Gardening, 108; La Rose, Histoire et Culture (M. J. Bel), 739; Les Plantes d'Apartment et les Plantes de Fenêtres, 192; Making of Flowers, the (G. Henslow), 76; Manipulations de Botanique Medicale et Pharmaceutique (M. M. Herail et Valère Bonnet), 740; My Gardener; A Practical Handbook for the Million (H. W. Ward), 706; Mushrooms and their Culture (C. Massee), 768; Select Extra Tropical Plants Readily Eligible for Industrial Culture or Naturalisation (Baron F von Mueller), 740; Silva of North America, the, 76, 195; The Birds of our Rumbles (C. Dixon), 706; The Fruit Grower's Guide, 676; The Miniature Fruit-Garden and Modern Orchard (T. Rivers and T. F. Rivers), 739; Tillage and Implements (W. J. Maiden), 402; Travels and Adventures of an Orchid Hunter (A. Milligan), 739; Vegetarian, the, 765; West Indian Flora and Fauna, Extract from, 738
 Bordeaux Mixture, 593; Messrs. Sutton's experiments with, 523; and the Potato disease, 609
 Botanical library at Kew, 739
 Botanical Magazine, 371, 490, 739
 Botanic Gardens, Palermo, 371
 Botany, possibilities of, 306
 Bottling fruits, 244
 Bouquet-holder, a new, 739
 Bouvardias, 619
 Bowood Park, 125
 Box, a forest of, 371
 Breaking-up pan, 404
 Brentford, a new market at, 460, 760
 Briar stocks for Standard Roses, 335
 Brien, James O', 225
 Bright colours in autumn foliage, 521; in tree foliage, 558
 British Association, 280
 British flies, 706
 British Fruit Growers' Association, 484, 579
 Broad Horn Ferns, or Platycerium, 697
 Broccoli, good winter, 713, 762
 Broccoli, late, Veitch's Model, 306
 Brocklesby Park, 39
 Broom, cream-coloured, 17; Spanish, 162

Browallia, the genus, 188
 Buenos Ayres, 192
 Bulb crop at Haarlem, 16
 Bulb garden, 486, 555
 Bull's, Mr. W., winter garden at, 74
 Burghley House, Strawberries at, 140
 Burford Lodge, Orchids at, 19
 Burgundy, wine prospects in, 128
 Burn Park, Uddingston, 275
 Burnt-earth in the propagation of plants, 708
 Burton Flower Show, 17

C

CABBAGES, bolting of, 18, 76, 110
 Cacao, Coffee, and Coca in Peru, 175
 Cactuses, respiration of, 401
 Calampelis scabra var. rosea, 672
 Calceolaria pinnata, 402
 Calceolarias, herbaceous, 171; striking, 397
 Calcutta, Botanic Garden at, 396
 Callicarpa purpurea, 103
 Calycanthus occidentalis, 702
 Campanula pyramidalis alba, 403
 Camphor as an insecticide, 77
 Candytufts, 22; perennial, 37
 Carbolic acid for Industrial Culture or Naturalisation (Baron F von Mueller), 740; Silva of North America, the, 76, 195; The Birds of our Rumbles (C. Dixon), 706; The Fruit Grower's Guide, 676; The Miniature Fruit-Garden and Modern Orchard (T. Rivers and T. F. Rivers), 739; Tillage and Implements (W. J. Maiden), 402; Travels and Adventures of an Orchid Hunter (A. Milligan), 739; Vegetarian, the, 765; West Indian Flora and Fauna, Extract from, 738
 Cardeux Mixture, 593; Messrs. Sutton's experiments with, 523; and the Potato disease, 609
 Botanical library at Kew, 739
 Botanical Magazine, 371, 490, 739
 Botanic Gardens, Palermo, 371
 Botany, possibilities of, 306
 Bottling fruits, 244
 Bouquet-holder, a new, 739
 Bouvardias, 619
 Bowood Park, 125
 Box, a forest of, 371
 Breaking-up pan, 404
 Brentford, a new market at, 460, 760
 Briar stocks for Standard Roses, 335
 Brien, James O', 225
 Bright colours in autumn foliage, 521; in tree foliage, 558
 British Association, 280
 British flies, 706
 British Fruit Growers' Association, 484, 579
 Broad Horn Ferns, or Platycerium, 697
 Broccoli, good winter, 713, 762
 Broccoli, late, Veitch's Model, 306
 Brocklesby Park, 39
 Broom, cream-coloured, 17; Spanish, 162

- Cereus J. T. Peacock, 527; *C. peruvianus*, 37
 Chancellor Swayoe's Garden, 128
 Chemical changes during growth of Potatoes, 401
 Chemistry of soils, 497; of the Apple, 611, 733
 Cherries in 1891, and previously, price of, 76; in September, 585
 Cherry Early Rivers, 75
 Chestnut Tree struck by fire-ball, 523
 Chicago Exhibition, 400, 617, 706, 736; flowers at, 491
 Chimonanthus fragrans, fruiting of, 679
 China-grass in Dundee, 276
 Chinese Primrose, the original, 555
 Chiswick Conferences, 398, 428; notes, 219, 242, 280; *Violas* and *Pansies* at, 75
 Churchtown Gardens, the, 363
 Chrysanthemum buds, 232
 Chrysanthemum Etoile de Lyon, 650, 708, 742; *C. irutescens*, 103; *C. Golden Hermione*, 741; *C. Mrs. Alpheus Hardy*, 708; *C. Mrs. Robinson King*, 761; *C. W. W. Colea*, 762
 Chrysanthemum notes, 669, 701; prospects at Woodhatch, 587; sports, 575, 610, 620
 Chrysanthemum show at Paris, 617
 Chrysanthemums about London, 459, 493; at Camberwell, 548; at Messrs. Veitch & Sons, 530; at St. John's Nursery, Putney, 548; changeableness of, 485; buds, 232; in New Zealand, 219; in September, 273; in Sydney, 17; in Monmouth, 708; seedling, 526; Ben-and-Chickens variety, 618; New Single-flowered, 762
 Cider, keeping, 619; making, 620
 Ciergnon, Belgium, 492
 Cineraria, the, 731
 Cirrhopetalum Colletti, 490; *C. Thouarsii*, 69
 Cistus laurifolius, 162
 Citrus aurantium, 371
 Classification of Rose-growers and other exhibitors, 639, 680, 707
 Climbing Niphetos Rose, 586, 619, 657, 679
 Cliveden, 46
 Clivea miniata, garden varieties of, 334
 Clipping in Wallflowers, 731
 Cochli da Nozliana, 394
 Coffee-leaf fungus, 68
 Coleworts, sowing and planting, 82
 Colombia, 483
 Colonial notes, 20, 68, 143, 625
 Colour of grass, 588
 Colpoon compressum, 68 (see *Preum besjes*)
 Colpoon = *Osyris compressa*, 68 (see *Preum besjes*)
 Columbines, 127
 Commemoration trees, 555
 Commons and woodlands, birds of the, 730, 758
 Cone female, of *Abies Webbiana*, 395
 Conference Pear, 679
 Conifer Conference, &c., 370, 435, 490, 458; contributors of, to Royal Horticultural Society's Conference, 402
 Conifer seed sowing and sowing, 404
 Conifers at Hutton, dimensions of, 68
 Coning of *Cedrus Deodara*, 492
 Contest in potting in Madison Square Gardens, 757
 Continental novelties, 561, 586, 621, 672, 741
 Co-operative flower show, 250
 Copper carbonate for fungi, 137
 Copper-salts and fungous-mould, Sutton's experiments, 488
 Copper-salts and Potato disease, 309, 488
 Copyright values of gardening books, 199
 Cork Pine at Chicago, 676
 Coryanthes, two new, 483
 Cotton-caster horizontalis, 702
 County Councils and technical education, 372; and the Education Scheme, 618
 Couroupita guianensis, 649
 Covent Garden, 16
 Covert plants, 732
 Cow manure, advantages of, 401
 Crab John Downie, 426, 492
 Cracking of Pears, 406
 Cream-coloured Broom, 17
 Crépin celebration, the, 705
 Crépin, M., 738
 Crinum, hybrid, 522
 Cross-bred Orchids, 396
 Crown Imperial, the, 556
 Croxteth Hall, 545
 Cucumber disease, 75
 Cucumber Stourbridge Gem, 492
 Culture of Alpines, 454, 483, 548
 Cumberland Lodge, the large Vine at, 53
 Cunonia capensis, 585
 Currant shoots dying from *Phytophagus ribis*, 82
 Cyclamen, hardy, 708
 Cynochos chlorochilon, 69, 394; *C. versicolor*, 394
 Cypripedium, a £250, 618; a natural hybrid, 371; *C. Enfieldense* ×, 546; *C. insigne* Bohnhofianum, new var., 586; *C. insigne*, 94; *C. i. Sanderæ*, 669; *C. Lawrenceanum*, 699
 Cypripedium spectabile in Western China, 546
 Cypripediums, fertilisation of, 701
 Cytisus nigricans, 162; *C. scoparius Andreanus*, 17, 68
- D
- DAHLIA, Annie Harvey, 424
 Dahuria and Dahuricus, 557, 588, 680
 Dalgarno's patent turf cutter, 618
 Daniel's Continuity Cabbage Lettuce, 404
 Daphne cneorum, 218
 Darwin Tulips, 10
 Date, cultivation of, in Persia, 400
 Dates of Royal Horticultural Society's meetings, &c., in 1892, 739

THE TWO BEST CABBAGES

DICKSON'S FIRST AND BEST, and
DICKSON'S PERFECTION.

Per packet, 6d.; per ounce, 1s. Post free.

Mr. A. J. LANE, writing on June 1, says:—"I am very pleased with your "First and Best" Cabbage, which I sowed last summer for the first time. We have been cutting for the past three weeks, and I cannot hear of anyone else cutting so early. The plants withstood the severe winter remarkably well."

For other CABBAGES, LETTUCES, ONIONS, &c., for present sowing, see CATALOGUE, sent post free on application.

DICKSONS Seed Merchants & Nurserymen
CHESTER
(LIMITED)

TWO GRAND NOVELTIES.

A PURE WHITE BEDDING CLEMATIS, and the FERN which has lately received so many of the highest awards and proofs of admiration.

CLEMATIS, SMITH'S SNOW-WHITE
JACKMANII.

The flowers are paper-white, about the same size as those of the old purple Jackmanii, but produced in even greater profusion. It is unrivalled for beds, and also for climbing. Ready in August. 7s. 6d. each.

PTERIS TREMULA SMITHIANA.

This is a very valuable and distinct Fern. No Collection should be without it. Illustration and description free. 5s. to 10s. 6d. each.

We now have a very fine lot of the best varieties of CLEMATIS ready for planting out, also BEDDING PLANTS, and shall be pleased to send particulars.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

STANDEN'S

Established 30 Years. **MANURE.**

Exceeds all others in general fertilising properties and staying powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry Powder, with very little smell.

It is consequently particularly adaptable for Ladies interested in Plant Culture.

The highly fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

Sold in Tins, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each.

And in Kegs (free), at Reduced Prices:—
28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

THE **Gardeners' Chronicle.**

SATURDAY, JULY 4, 1891.

KNEBWORTH HOUSE.

SINCE my description of Knebworth in the *Gardeners' Chronicle* five years ago, the changes and improvements in the property have been very marked. A notable change has been the foreign residence of the owner, the Earl of Lytton, who, for the second time, has left his Hertfordshire home and his country in the service of the Queen. In consequence of his absence, Knebworth has been let to Mr. J. C. Osgood, an American gentleman. Mr. Osgood is fonder of hunting than of gardening, and has filled his enlarged stables—enlarged mainly at his own expense—with about thirty horses, but it must not be imagined that the gardens on that account have fallen into neglect. Mr. Kipling's service as head gardener here is of twenty-five years' date, and commenced under the late Lord Lytton, who then bore the more familiar name of Sir Edward Bulwer Lytton. The novelist and M.P. for Herts, till he became a peer, was one of those ardent persons whose pursuits are passions. He was passionately fond of gardening, and Mr. Kipling conducted the improvement of an old-fashioned garden, then not so extensive as the area covered by the great house, till his mother, Mrs. Bulwer Lytton, constructed one of customary size for a great house. The previous account of Knebworth, just referred to, described the horticultural fairyland which Lord Lytton created, comprising shrubberies and an Italian garden, a series of pleasure gardens, a rosery, a maze, and in the furthest distance a Roman garden of the time of Horace, with a temple of Diana and some appropriate classic busts ranged against a clipped Yew hedge as a background.

All these novelties and changes were carried out with great good taste, spiced sometimes by erratic genius. The last departure from Knebworth came in 1873, when Lord Lytton shook hands with his trusty gardener and bade him "Adieu!" sad word, says Byron, but one "which has been and must be." He departed for Bournemouth, and never returned. Other improvements and additions have been effected by the present Lord Lytton—the first earl, whose largest work, at present, as an innovator, has been the inclosure of 7 acres from the park to form a Wilderness, which is now in its fourth year of development, and which will in time become a very picturesque feature of the grounds. The present owner's taste is for "natural gardening," if the term may pass. We certainly have gardens which are far too formal and too much tricked out—too "dressy," or too artificial in their ornaments; and although Nature is not a gardener, and would make a very poor one, indulging in weeds and intercepting light and

CHARLES NOBLE.
THE Entire Collection of CLEMATIS (the result of a lifetime of hybridisation and selection) is to be **DISPOSED OF AT ONCE.**

CHARLES NOBLE
has just received a consignment of TREE and SHRUB SEEDS from the Mountains of Sukkin, many supposed to be new and all valuable.

CHARLES NOBLE
feels his entire attention must be devoted to this collection, and reluctantly sacrifices his old hobby.

CORRY, SOPER, FOWLER & CO.
(LIMITED),

16, FINSBURY STREET, E.C.;
And SHAD THAMES, S.E., LONDON.

air with great trees before our very windows, still the term "natural" as opposed to "meretricious," may be allowed to pass. It has taken the form here of a protest against the formal bedding-out system. In 1886, about 6000 bedders were planted out annually in spring; the number has increased to 30,000 plants, but those which are used now are not the tender tribes of former days, such as the Pelargonium, Coleus, Iresine, and Calceolaria, so much as the hardier plants of herbaceous habit.

A fine collection of Hawthorns, another outcome of the owner's special taste, has been formed at Knebworth. There are already twenty-seven varieties, and others will be added, and when I mention that these beautiful blossoming thorns form a leading feature in the Wilderness, it will be evident that such natural productions of a wild garden as the Nettle, Sowthistle, and the Dock, are not allowed to overrun this cultured enclosure. Even the Bramble, with its handsome leaves, is restrained within due limits. The Knebworth Wilderness is, in fact, one which ladies could pass through in their ordinary costume without being stung and torn; and who would care for a garden from which the fair successors of Mother Eve were excluded, through its rude disorder, and the growth of Nature's most unlovely specimens of vegetable life, foul toadstools, slimy fungoids, and deleterious Agarics?

The gardens and pleasure-grounds now extend to twenty-seven acres, which are kept in order by fourteen men. There are three vineries, and another range of houses devoted to fruits and flowers, and a span-roof house has recently been erected, 60 feet long by 18 feet wide, with one division for miscellaneous plants, and another for Orchids. During Lord Lytton's viceroyalty of India, he sent these Orchids home, twelve years ago. Among various species are *Saccolabium*, *Vandas*, *Dendrobium*, and *Aërides*, which connoisseurs have said could hardly be matched. They have all been grown hitherto in the vineries, where they have usually done well; but the winter temperature has proved a little too low for the *Vandas*, and new quarters have therefore been provided. An exception to the above-mentioned experience exists in *Vanda cornuta*, which has always flourished vigorously, and sent out flower-spikes every year, each carrying fifteen or sixteen flowers. There is, at the present time, one plant of *Saccolabium* with three racemes of flowers, each 18 inches in length. A plant of *Aërides* stands 4 feet high, and has several leading breaks and many flower-spikes. Besides these, there are some varieties of *Cœlogyne cristata*, which came from India with the rest, and which Mr. Kipling has had to establish. The best of these is a variety similar to the one known as the Chatsworth form, and the best plants of this are 2 feet across. In their season they bloom very freely. The most remarkable of the *Saccolabium* are *S. guttatum* and *S. g. giganteum*.

Perhaps I may be allowed to repeat what was said of the Knebworth Orchids six years ago, that the Vines are not subordinate to them, but the contrary, since a full crop of Grapes is expected, the first and earliest crop being started in December, while the Muscats and late black sorts ripen in September. Mr. Kipling says that after the Grapes are ripe the Orchids remain in the late vinery, where the regular use of fire-heat is discontinued from the time the crop is ripe. The temperature is never allowed, intentionally, to fall below 50°, though in the morning, after a cold night, it has occasionally reached 45°, a lowering which did not suit the *Saccolabium*,

though, curiously enough, the *Vandas* and *Aërides* did not appear to suffer from it. A temperature of from 50° to 55° is aimed at in the resting months. They stay in the same house till the end of December, when they are moved into the early vinery, where the night temperature is as above-named. As soon as the mid-season vinery affords them the required conditions, they are transferred to it, and afterwards to the Muscat-house, when the Vines are started. Here they are hung up, and their heads as much exposed to the light as the foliage of the Vines will allow; and through the summer the Orchids and the Muscats live by necessity under similar conditions of heat, air, and moisture.

Another improvement, just outside the garden, but not to be ignored from a landscape gardening point of view, has been effected since the opening of the Knebworth Station on the Great Northern Railway, by the building of a pair of entrance lodges, in Queen Anne style, in the village, and the opening of a new carriage-drive through the park to the house. H. E.

KEW NOTES.

THE large Cactus, *Cereus giganteus*, which was imported from Mexico in July last, and planted in the Palm-house, is showing active signs of life. There are several Pear-shaped growths, which will no doubt turn out to be flowers, besides signs of growth at the apex. This must be very gratifying, as it is the largest ever brought into this country, measuring 14 feet in height, with a girth of about 4 feet, and weighing 12 cwt. The wounds on it produced by bruising on its passage from Mexico, are quite healed up, through constant attention in the way of dressings with flowers-of-sulphur and powdered charcoal; so that there is considerable hope that this fine specimen will form one of the many attractions at these gardens for many years to come.

It is rather disheartening, that at the same time as we report the progress of one valuable plant, we have to record the downfall of another, but so it is; for, without a moment's warning, one of the largest Palms, *Latania borbonica*, syn. *Livingstonia chinensis*, in the Palm-house, snapped off about 12 feet from the ground. In its fall it came in contact with the wire supports of *Phoenix sylvestris*, another very large Palm, bringing that down also, and doing considerable damage to the plants around. It is rather remarkable that a plant of such tree-like dimensions should become top-heavy, and break off (which was undoubtedly the cause of it falling) without there being any other obvious cause.

SYRINGA JOSIKÆA, ETC.

Nor long ago an article in *Garden and Forest* discussed the different species of *Syringa* cultivated in gardens, and in this article it was stated that the native country of *Syringa Josikæa*, Jacq., was unknown, and that all the plants in cultivation have been derived from a single specimen found in a garden in Hungary.

The statement is inexact, and the country where this species grows naturally is well known. It was discovered in 1830 by the Baroness Josika (née Craki) in Transylvania, not in a garden, but on the rocky banks of the river Sebes, in Clausenberg, and the younger Jacquin, who named the plant in honour of the discoverer, showed specimens of it at the Congress of Naturalists held that year at Hamburg, inserting the first diagnosis of his species in the account of this meeting published in the *Bot. Zeit.* (1831, p. 67). Reichenbach, in his *Flora Germanica Excursoria*, published in 1830-32, gave characters of *Syringa Josikæa*, with an indication of the region

where it had been found; and the same author, in his admirable *Iconographia of the German Flora*, publishes a figure of it. In more recent years, various Hungarian collectors have found the plant in its native country, and have distributed specimens.

In order to remove any doubts which may still exist upon the occurrence of *Syringa Josikæa* growing spontaneously in north-eastern Hungary, I have written to some of my Hungarian correspondents, Professor Borbás, at Buda Pesth, and others. They give me exact and complete information with regard to the discovery of the plant, and the localities where it grows, which can leave no possible doubt with regard to its spontaneousness in Europe. I am indebted to the kindness of Mr. Carl von Flatt, judge at Elest, near Grosswardein, the country of *Syringa Josikæa*, for a list of the ten localities where it is known to occur, and which extend over the four counties of north-eastern Hungary—namely, Kolos, Bihar, Ung, and Marmaros. It is in the first of these, Kolos, that the plant was discovered on the river Sebes.

S. Josikæa grows everywhere near the water, at an altitude varying from 300 to 400 mètres above the sea, between 46° and 48° of north latitude and between 40° and 42° of east longitude. Mr. Victor Janka describes (*Ostreich, Bot. Zeit.*, 1885, 3, f. f.) the locality in the district of Marmaros, where he first found it, as covered with thickets of Alder, *Rhamnus frangula* and *Salix aurita*.

Mr. Carl von Flatt, to whom I am indebted for the bibliography* of this species, which is joined to this communication, writes:—"The home of the plant growing spontaneously is in the primeval forests of the mountain-chain which separates Hungary from Siebenburgen. For miles and miles of the territory where *S. Josikæa* grows neither a house nor a hut is to be seen. The stations discovered by me are both in the Remetz mountain forests; one, Lunka Kotuni (1885), furnished few specimens, but there are finer ones in Pareu Föeguczat (1886), where there are nearly a thousand plants growing. Probably Kitabel had heard of this plant. In his manuscripts, preserved in the National Museum at

Buda Pesth, there is a drawing with the following note:—

"*Syringa prunifolia*, Kit. Ita interea pro conservanda memoria nomino que ad viam Munkacsino-Leopolim (Lemberg), ducentem inter Felső-Hrabonicza et Pudpolock in comitatu Beregh crescit, foliisque Pruni distincta, referente Dre Balla."

"Seudel, in his *Nomenclator Botanicus*, gives under

all idea of garden origin. And, you know, Monsieur Franchet has suggested the identity of *S. Josikæa* and *S. Emodi* of the Himalayas (*Observations sur la Syringa du Nord de la Chine*), but certainly no one had ever cultivated the Indian plant in Hungary previous to the year 1830, when *S. Josikæa* was discovered, and even to-day it is very doubtful if a single specimen of *S. Emodi* can be found in all that district.

this country *S. vulgaris* maintains itself easily, and for a long time, wherever it has been planted, and therefore, sometimes appears spontaneous or sub-spontaneous, although it is not indigenous here. This is the case, too, with *Philadelphus coronarius*, which is often found about the ruins of buildings which have been abandoned for more than half a century, furnishing the last trace of ancient gardens. *H. Christ, Bile, Switzerland, in Garden and Forest.*

FIG. 1.—*ACER VOLXEMI*, MAST.: SHOWING LEAF AND RIPE SEED-VESSEL.

S. Josikæa as a synonym, *S. vincetoxifolia*, Baumg. Where he found this I cannot tell, for Baumgarten did not publish such a name."

If *S. Josikæa* is to be considered an escape from cultivation, what known species can it have been derived from? Certainly there does not exist in Europe any species from which it can have been derived, a reason sufficiently important for rejecting

SYRINGA VULGARIS.—Permit me to call attention also to an error with regard to the native country of *S. vulgaris*. That plant does not grow wild in Piedmont, and its most western station is southern Hungary, in the neighbourhood of the Danube. If more western stations are given in some Floras, it is for plants which have escaped from gardens. [See note of M. André in our present issue. *Ed. G. C.*] In

ACER VOLXEMI (figs. 1 and 2).

In our number for January 20, 1877, we published an illustration of this species. It seemed to us at the time, as it has done ever since, to be amply worth a separate name, at least for garden purposes. No more appropriate name could be given to it than that of its discoverer, Mr. Jean van Volxem. He

met with it in the Caucasus, and his trained eye at once recognised its distinctness. From that time to the present we have grown the tree, which is perfectly hardy, and remarkable for its robust and rapid growth, and the silvery-whiteness of the under-surface of its "ample" leaves. On this account we have frequently exhibited branches of it, and urged its cultivation as an avenue tree, or for any purposes where a tree of rapid growth and noble aspect is required.

The materials upon which we relied in describing the species were avowedly inadequate, so that it is no wonder that, in the minds of other botanists not so familiar with the aspect and habit of the tree as ourselves, our tree was considered to be a form of *A. pseudo-platanus*, or of *A. insigne*. We had, however, taken the precaution to compare all the available specimens of these species before committing ourselves, and were favoured with specimens of both from M. Boissier himself. Our tree of *A. Volxemi* grows so rapidly, and the space at our disposal is so circumscribed, that we are perforce obliged to commit the barbarity of lopping the tree every year. In consequence of this, perhaps, no flowers have been produced. From Mr. Van Volxem, however, we have lately received flowering specimens, of which we hasten to give an illustration, and so to complete our original description (see fig. 2).

It will immediately be seen (fig. 2) that its erect corymbose inflorescence and glabrous filaments separate it widely from *A. pseudo-platanus*. Whether it be distinct from *A. insigne* (Boissier, not of Hook. in *Bot. Mag.*), is a question on which we shall have something to say shortly, when we lay before our readers an illustration of that species, which is also growing in our garden, which flowered for the first time two years ago, and is flowering again abundantly this season. *M. T. M.*

ROSES.

THE WINTER OF 1890-91, AND THE ROSES.

(Continued from vol. ix., p. 728.)

THE climatic variations in our small island, occasioned doubtless, to some considerable extent, by its being an island, are somewhat remarkable; and people who speak and write very dogmatically about the hardiness or otherwise of certain things without indicating the spot from whence they hail, are apt to mislead instead of guiding others. Thus the condition of that part of England of which I have hitherto written, the west and southwest, is considerably different from that about which I now write; a line drawn across England from say Hereford, would hit somewhere about Aldborough on the east coast in Suffolk, yet while at the former place the average rainfall is somewhere about 30 inches, at some stations in Suffolk it is not 20 inches, and in many places on the east coast less; the greatest difference occurs, too, in the autumn, which is drier here than in any other part of England. This must tend to the ripening of the wood and consequently to the power of resisting frost, and I feel strongly that if I had to choose a place in which to make a Rose garden, more especially a Tea Rose garden, I should choose East Anglia. True you have to reckon with the east winds, of which you feel the full benefit. We used to say at Deal, it blew to us straight from the North Pole, and there have been frequent jeremiads from one, at any rate, of your correspondents, as to the terrible condition of these regions; but withal we have always, since I can remember aught of Rose showing, had some of our very best flowers from that side of England; forty years ago, Ben Cant amongst nurserymen, and Mr. Hedge, of Eyre Hall, amongst amateurs, long before others thought anything about Teas, used to carry off the spoils of victory and bring reward. There cling to one's memory the blooms of *La Boule d'Or*, *L'Enfant Tisore*, and *Souvenir d'Elise*, which later years have not tended to efface. And now Ben still remains, his nephew has taken a leading place, and the clerical contingent, Messrs. Bernes, Foster Melliar, and Page Roberts have shown us that

East Anglia can hold her own in the fierce contests that are now fought for the Queen of Flowers.

That East Anglia has suffered this year in the severity of the winter there can be little doubt. One fearful howl reaches us from Norfolk sufficient to rouse the dead. "No Roses this year—all our Rose trees dead." My friend is apt to speak and write in hyperboles, and I therefore take this statement with the proverbial grain of salt—but even then it indicates that he has been very "hard hit."

Here is Mr. Ben Cant's statement: "The lowest temperature recorded here was on the night of Jan. 9, 7°, or 25° of frost; and all through the winter the temperature on the ground was from 6° to 8° lower than at 4 feet from the ground, and to this is to be attributed, perhaps, the great injury done to the dwarf Teas. Our soil is very dry loam, but I always grow my Teas in the lightest ground, which stands very high and most exposed. Standard Teas not much injured, excepting *Comtesse de Nadaillac*, *Devoniensis*, *Niphetos*, the *Bride*; many sorts entirely unprotected, such as *Anna Olivier*, *Madame Cusin*, *Madame de Watteville*, and *Maréchal Niel*, are not hurt at all, while the same sorts as dwarfs, although protected, are killed to the ground, and many of them killed outright—in fact, all dwarf Teas and *Noisettes* very much injured. Budded Teas and *Noisettes* of last season's working have not suffered at all, the former had no protection, the latter were covered with Bracken. It has often been said that green unripened wood is sure to be killed, but many of mine have made shoots 12 to 18 inches long, and not one of them was injured. H.P.s did not suffer anything worth mentioning." This is a very remarkable fact, and coming, as it does, from one of our oldest and most successful Rose growers, it deserves careful consideration; but as one swallow does not make a summer, so all this is the exception that proves the rule—the rule being how to grow standards where you can grow dwarfs. I confess it puzzles me, and I think will puzzle wiser heads than mine.

We have few amateurs who know the Rose better, and who are more careful observers of its manners and customs, than the Rev. Foster Melliar, Sproughton Rectory, Ipswich. In his report to me, he says, "Our lowest temperature was 5°, in a sheltered position, on a north wall, 4 feet from the ground. The position of the garden is a very sheltered one, although low, only about 23 feet above sea level. I have not yet examined my Teas (March 18), but have sampled them, and should estimate the loss at less than usual, due, I suspect, to the fact that the minimum temperature was little below the average, and the wood dried and ripened off in the autumn above the average; a few hybrids, such as *Puritan*, cut, but not many. I do not think it would be much loss if *Puritan* was cut out altogether." Yet one other testimony from the eastern counties, that of Mr. Burrell, of Cambridge, who writes: "We have no present bed of Tea Roses, as we had sent all away in November. The most severe frost that we had was about the level of zero, but with six inches of snow; and all together the tops of the Teas are killed and damaged—one was killed outright, except a few old standards. Dwarfs of all kinds have broken strongly from base. The hardier Teas such as *Caroline Kuster*, *Boule d'Or*, *Marie van Houtte*, *Madame Lambert*, *Souvenir d'un Ami*, *Souvenir de Sarah A. Prince*, *Princess of Wales*, *Jean Ducher*, *Francisca Kruger*, the most tender *Niphetos*; *Comtesse de Nadaillac*, *Devoniensis*, and *Innocent Pirola*; no damage was done to the H.P. Soil medium calcareous loam; situation quite open. I fear that the frost on Whit-Sunday and Monday may have done more harm than the winter's frost." I had a very bad account from Yorkshire: "We had about 25° of frost here, with snow hanging on the trees, and it is quite marvellous how well things have stood; none of the growth has been cut back or discoloured, and the shoots have grown a good deal since." I now pass away from the coast to the interior; the accounts vary very much. Mr. E. Mawley, that very close observer of meteorological events, says, "My soil is clay, and flints on

chalk, about 400 feet above sea-level. My plants are very little injured, less so than in much milder winters, although we had 22° of frost." This was written on March 3; but since then he has told me that there was considerably more damage done to his Teas than he had at first supposed.

Mr. E. B. Lindsell writes from Hitchin, "My soil is clayey loam, subsoil boulder clay. Situation open to E. and N.E., 218 feet above sea-level. The lowest temperature recorded during the frost was on December 22 last, when the thermometer fell to 3.4°, giving 28.6° of frost. The dwarf Teas which were earthed-up and protected with Bracken, appeared uninjured below the snow-line, but standards have suffered terribly. I entirely rely on standards to give exhibition blooms of *Comtesse de Nadaillac*, *Niphetos*, *Maréchal Niel*, *Madame Cusin*, *Madame de Watteville*, and *Ethel Brownlow*, and 20 per cent. of my stock have been killed though the heads of the plants were well filled with Bracken. It is somewhat singular that standards of *Niphetos* and *Ma Capucine* in pots, which stood outside all through the frost without protection except from a little Bracken, escaped comparatively uninjured, and have flowered well. All H.P.s, except *La France* and *Lady Mary Fitzwilliam*, are grown here as dwarfs on seedling or cutting Briar, and go through the winter unprotected by us; but in this last terrible winter Nature kindly gave the plants a covering of some 3 inches of snow, which saved us from disaster, as many plants were killed outright down to the snow-line. The sorts that suffered most were the *Baroness* and her two descendants. Her Majesty (certainly a tender Rose), and *Merveille de Lyon*, *Pride of Waltham*, *Lady Sheffield*, and some other of the smooth-wooded varieties of the *Victor Verdier* race. *Lady Mary* has suffered severely as a standard, but I am glad to be able to give a certificate of hardiness to Messrs. Dickson's fine Roses *Earl of Dufferin* and *Lady Helen Stewart*. *Suzanne-Marie Rodocanachi* has also stood the frost well. This beautiful Rose should be catalogued under Mr. Girdlestone's name, he being the *vates sacre* who rescued it from oblivion."

I have a few more notices of the effects of the winter in some of the Home Counties. The friends with whom I have corresponded have, as it will be seen, given much useful intelligence on the special subject for what I asked for information. Each day now brings us nearer the exhibition time, and the trepidations of growers are evidenced by the postponement of shows; but the last weeks have done wonders in bringing on the flowers, and should the fine weather continue, perhaps Roses may not be so far behind as has been supposed. *Wild Rose.*

THE BULB GARDEN.

THE DARWIN TULIPS.

THOSE who doubt the future of the new and entirely distinct race of Tulips which Mr. J. H. Krelage has named after the distinguished English naturalist, would no longer have harboured any scepticism had they visited Haarlem a few weeks ago, when this magnificent strain was in the full flush of its beauty. No words can adequately describe the appearance of batches of the Darwin Tulips in flower with the sun shining directly upon them. To a casual observer, the colours and shadings appear infinite, and, as a matter of fact, I believe there are over 2000 more or less distinct varieties. As they are destined to play an important part in spring gardening in the future, perhaps a few notes on their history will not prove unwelcome. For the main part of the facts, I am indebted to the veteran bulb-grower, Mr. J. H. Krelage, whose courtesy to visitors to Haarlem is well known, and whose extensive library is a bookman's Paradise, where the bibliophile might for years find plenty to interest, to instruct, and to amuse.

The Darwin Tulips are of Flemish origin, and originated from seeds sown between the years 1860 and 1872, from the best breeders and broken (variegated) strains, out of the most famous collections in

French Flanders, which, in their turn, had been undergoing the process of selection in the hands of one family for over a century. This collection would, in all probability, have been lost to horticulture if Mr. Krelage had not purchased it a few years ago, for the owner was almost as much disposed to destroy it as he was to sell it. However, Mr. Krelage secured the entire stock, and for the past few years has been busy in propagating the various sorts. In the course of the forthcoming autumn many thousands of bulbs will be put into commerce, although as yet the prices, if exceedingly moderate, taking all the circumstances into consideration, are somewhat prohibitive, and the strain

created a sensation. The varieties include almost every conceivable colour and shade, from pale porcelain to the darkest violet, from soft rose to the most brilliant red, from light brown to what is believed to be the darkest black in the floral world. These Tulips have very large well-formed flowers, which are placed on tall strong stems often nearly 2 feet in height. The leaves are proportionately large and strong. Indeed, compare a batch of these with one of ordinary Tulips, the contrast is as great as that which exists between a regiment of the Grenadier Guards and the most insignificant of country rifle corps.

As is usually the case, the choicer sorts are the

widely appreciated by horticulturists, not only in England, but throughout the world. In asking permission to use the name, Mr. Krelage received the following note from Professor Francis Darwin:—"If my father had been alive I am sure he would willingly have consented to your proposal, and I think I may safely answer for the other members of the family, who I am sure will feel pleased, as I do, at the spirit and manner in which you propose to name your new strain."

As regards cultivation, Mr. Krelage has no "patent method," as he finds that they do sufficiently well where other Tulips thrive. They certainly luxuriate in the light porous soil of Haarlem and

FIG. 2.—*ACAEA VOLXEMI*, MAST.: LEAF, INFLORESCENCE, AND FLOWERS. A, HERMAPHRODITE FLOWER; B, MALE FLOWER, BOTH MAGN. $\frac{1}{4}$ DIAM. (SEE P. 9.)

will not be extensively grown for bedding or massing purposes. The very cheapest with names, but mixed, are 30s. per hundred; whilst for single bulbs of the superior sorts the sums of from 7s. 6d. to £2, and even more per bulb, will be asked. And from all indications at present the demand will cause a nineteenth century Tulipomania on a small scale.

Darwin Tulips were quite a feature of the Paris Exhibition of the year before last, and were the admiration of all who saw them. The six beds in the lawn surrounding the basin before the Trocadero contained 720 varieties, of each of which there were four bulbs. This exhibit was awarded a Gold Medal, and at several other exhibitions they have

slowest and most difficult to multiply. Perhaps the most welcome, as they are also among the rarest of the new strains, the black and the darkest red shades will be the most generally welcomed by horticulturists. The black variety is simply a magnificent variety, for it is as deep and decided in its colour as anything to be found in the vegetable kingdom, and calls to mind the story of "la Tulipe noire," of Alexander Dumas, who probably never dreamt of the possibilities of horticulture, or that a "black Tulip" would one day be *un fait accompli*.

The dedication of the strain to the memory of the late Charles Darwin is a graceful act, which will be

Overveen. Mr. Krelage tells me that one or two amateurs in this country have not succeeded in growing the Darwin strain to perfection. If they described their methods of culture, it might be easy to suggest another method of procedure. *W. Roberts.*

PRESERVED PLUMS.

THERE stands before me a tin of well-preserved Plums; the weight of fruit and syrup is 2½ lb., and the cost to me is 9d. Possibly in the Stores the tin might be purchased more cheaply; at any rate, here we have delicious sweet cooked Plums, only

just needing thorough examining before eating, for less than 4d. per lb., and that, too, at any time of the year. Were these Plums of home preparation, we might have felt more satisfaction in the contemplation of a most interesting evidence of business enterprise. The label shows, however, that they are of American production, and from Monroe county, New York; they are called Egg Plums, and perhaps may be of a variety so called in America, but really are of about the size of Greengages, of a greenish-yellow colour, and clingstone. The tins are cheaper and contain much more fruit than the bottles, which seem to be of home production, so that we find America competing with our home preservers successfully, and offering to the million delicious fruits for ordinary consumption at moderate prices. We may regard a big Plum crop this season as an almost assured certainty. There is a large set, and only some very unlooked-for disaster can prevent the crop maturing. What are we going to do with it? That is, indeed, the question. We have few more perishable fruits than is the Plum, and a very abundant crop is, with our present restricted means of disposing of it, not always a desideratum. Once gathered, the fruits must be sold at some price quickly, or utterly spoil. We have seen that sort of thing frequently in previous years, when there has been a large Plum production. We shall assuredly see it again this year. Why can we not help to utilise our own great abundance at once for the benefit of growers and the consuming public, by setting up at home canning establishments, for the preservation of all superfluous fruit, rather than allow our fruits to waste, and purchase from America. I am not writing in this strain from a stupid Protectionist point of view. What we want to see is common sense prevailing, and our own growers doing what enterprising growers in America do so successfully. If it pays to can Plums and send them over here, to be retailed for consumption in thousands of British homes, at less than 4d. per lb., it ought to be possible for home-growers, if they had their own canning factories, to place tinned Plums at our disposal even more cheaply.

We have been urged to adopt the drying method of preserving Plums. That would, I doubt not, prove a much costlier and less satisfactory process of utilising Plums than is canning. There have been some foolish prejudices at times created against tin fruits and vegetables; but the alarm has no foundation in fact. Literally millions of imported tins of fruits and vegetables are consumed in this country, which are found to be entirely pure and healthy. The trade is so dependent upon a good reputation, that outsiders seem to put us to shame by the great care they take in the methods of preserving products, whether in cans or otherwise. The same thing prevails in connection with the trade in fresh fruits and vegetables, and until our home growers in the matter of selection and packing take a leaf out of foreign growers' books, they must be content to accept moderate prices. Whether we can compete with the French in the matter of drying Plums is doubtful; we may adopt the same methods, but still lack the climate to mature Plums suitable for drying—all that, however, has to be shown. So far as canning is concerned, it would seem certain that we can do that as well as others; we only want the appliances. We only fail in those industries which we can hardly domesticate, in the same way we can with preserves or jams, or in bottling fruits. In proper factories the work can be so much more efficiently done, that it would be wiser to pay a little more and have the contents of the tins thoroughly preserved. The present season offers a capital opportunity for the beginning of a home-canning trade. It is to be hoped that insular enterprise will not be backward. *A. D.*

ACACIA TREES IN EGYPT.

The Sial trees are so important in Abade life, that they merit a few words. Riding up the valley, all were hacked to pieces; sometimes every hough lay leafless on the ground, and the gnarled trunks

stood naked, bleeding a red gum. Elsewhere stood trees fairly preserved. Everywhere were long white poles with hooked ends, the bark and thorns carefully stripped off. These are the shepherds' hooks, so often seen in Scriptural pictures. . . . They are used for pulling down the branches, and shaking off the small green leaves. A child takes up a crook, and goes to a tree, quickly followed by his half-dozen sheep and goats. For them he shakes the tree, until no more leaves will fall, and the sheep pick them up from between the stones. For camels this is not enough; the boughs must be cut down, that the camels may eat them with that contemplative caution which is a chief characteristic. A traveller halting at sunset is soon up a tree with his axe. The dead boughs later on are burnt for charcoal, and exchanged for Wheat at the rif, a term applied to the river bank, as it is to the north coast of Africa, whence came the first ruffians. There has doubtless been much immigration from the West, and El Gharbawi is not an uncommon cognomen. . . . Further on, a line was drawn across the path, a mere scrape of the hand in the soft sand. This was the boundary between two families, whose farming differed. Secure at the summit of his mountain here lived an old patriarch, who had been blessed with a numerous family. His policy was to let all his trees grow to their fullest size. A white-bearded old man, and very pleasant; but, oh! so tedious in his courtesy. His fine spreading trees were doubly pleasant after the devastation below, where the family had said to themselves, "If the greybeard won't use his own trees, he shall have no temptation to cut ours." *Extract from a Letter of Mr. Floyer, in "Atheneum," June 27, 1891.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

APRICOTS.—The splendid rains have done a great deal of good to all fruit trees, but yet where the soil is light and shallow, and the Apricot trees are bearing heavy crops, artificial waterings at the root will be needed. Before affording water, loosen the soil slightly with a fork, and lay on a mulch of manure. Let the crop of fruit on old trees be rather light than heavy; and lay in plenty of young wood, and, where practicable, the main branches should be covered with young foliage, so as to defend them against strong sunshine. In shortening back shoots to form fruit spurs, leave four or five buds from the base; keep all the leaders of young trees neatly fastened to the walls, and watch for snails, slugs, woodlice, and other creatures which damage the fruits.

PEARS.—Summer pruning should now be proceeded with, taking in hand first those which are making the strongest growth, not divesting the trees entirely of the new growth at once, but going over them twice or even thrice, cutting back the shoots the first time to live buds. Now is a good time to note such trees as stand in need of lifting and root-pruning in the autumn.

CORDONS, PYRAMIDS, AND ESPALIERS should have the leading shoots trained in, but not tightly, or in contact with the training wires, or the nails if on walls. Crops of Pears are heavy this year, and a second thinning of the fruits will be needed; and heavy mulches, especially to Pears on the Quince stock which are surface rooters, and to those which may be making scanty growth—failing a mulch, sprinkle the soil over the roots with Thomson's Vine Manure, Clay's, or good guano.

Cordon Apples planted at the side of walks and other conspicuous places, should consist of large and showy varieties. Do not let them carry very many fruits, or maggoty ones—as soon as observed these last should be removed and burned. Where the "maggot" abounds, hand-pick carefully, this being the surest way of destroying it; mulch and afford the cordons plenty of water in dry weather. Pinch the side shoots once or twice, but not closely, or the lower buds, which should be dormant, will start. [Mr. Rivers, a good cultivator, cuts back the shoots to 6 inches in July, and shortens back still further in winter. Ed.] When the leading shoots of double cordons do not grow evenly, break the strongest

leader half in two and leave the end hanging; this will in a great measure check the flow of sap in that direction, and by only being half broken the back buds are not so liable to burst, while the weak ones will be strengthened. It is a method which may be practised with young espalier and many other trained trees.

PLUMS.—Most of these are cropping heavily, and where practicable the fruit should be reduced in numbers. Large-fruited Plums should certainly be attended to in this respect. Water and mulch as recommended for Pears. The trees against walls of the Greengage, Coe's Golden Drop, Reine Claude de Bavay, Ickworth, Imperatrice, &c., should have plenty of strong shoots laid in, as it is on these when two or three years old that the best and finest fruits come. Have the foliage cleaned before the fruit gets much advanced.

CURRENTS on walls should have a free thinning out of the breast wood, and the shoots required for filling up bare spaces secured, remembering that young wood gives the finest fruit; and if a dressing of manure can be applied it will be of much benefit. Gooseberries on trellises and walls should be similarly attended to. Fruits for bottling and jelly-making may now be gathered. Place litter underneath the bushes so as to keep the berries clean. *H. Markham, Mereworth Castle, Maidstone.*

THE FLOWER GARDEN.

SUMMER BEDDERS.—**CARPET-BEDS.**—The effects of the recent much-needed rains are nowhere more marked than in the growth made by all sorts of bedding plants. So, notwithstanding the backwardness of the season up to a recent date, the beds promise to be as well furnished by the middle or end of the month of July as they have been at that date in previous years. Peg down the growths, and otherwise pinch and train into shape the various carpeting plants. Gather the flowers off Sedums, Echeverias, Saxifrages, Golden Chickweed (*Stellaria graminea aurea*), and plants of similar growth, pressing down the centre of these plants with the fingers, and thus induce them to cover their allotted space quickly. Cut off with the shears any growths that spoil the dividing lines of plants, as well as from the plants which fill out the divisions themselves. *Cerastium arvense*, *Herniaria glabra*, *Stellaria*, and *Antennaria tomentosa* are the plants most quickly trimmed into shape.

Carpet-beds from this date to the middle or end of September should, however, be gone over at least twice in about three weeks, to keep the patterns quite distinct, and the whole in good order. When well-kept—as they should be—these mosaic patterns, formed exclusively of dwarf foliage plants of bright, soft, and pleasing colours, contrast most effectively with the masses of scarlet, pink, white, yellow, blue, &c., surrounding them. Continue to pick off all flowers from *Pelargoniums*, *Calceolarias*, *Begonias*, *Verbenas*, *Petunias*, *Heliotropes*, *Lobelias*, and such-like, until the ground space is pretty well furnished, the object from the beginning being to cover the beds and borders with a mass of foliage and flowers in the shortest space of time. In the absence of rain, water in the afternoon any plants which are not growing quite so fast as could be desired, at least three times a week until the allotted space is covered.

CUTTING GRASS-VERGES AND EDGINGS.—It is necessary to cut the grass-verges alongside walks, as well as next the beds and borders, once a year with the turfing-iron. Where this operation has been deferred till a more convenient time, it should be done forthwith, afterwards cutting the fringe of grass growing over this line once a fortnight, which will be about every other time the verges and lawns are machined. Should there be any Plantains in the lawn, take means to remove them at once, as they are very undesirable objects in what might otherwise be termed a well-kept lawn. The quickest, neatest, and most effective means of ridding a lawn of Plantains and Dandelions that I am acquainted with, is to half-fill a blacking-jar with Smith's "Weed-killer," put the jar in a small shallow box, with a cross-handle for carrying it about, and, armed with an iron skewer about 9 inches long, dip the skewer into the weed-killer, and then pierce the centre of the weed, dipping the skewer into the liquid each time a plant is pierced. The death of the plant is certain. This "weed-killer," being a deadly poison, and sure to kill any grass or plant it comes in contact with, great care is necessary in applying

it either in the manner indicated, or for eradicating weeds on walks; hence the necessity for placing the bottle securely in a box to prevent any mishap occurring. *H. W. Ward, Longford Castle, Salisbury.*

FRUITS UNDER GLASS.

LATE VINES.—The bunches of Grapes on late Vines being now thinned, and those for longer keeping more severely than early winter Grapes, the bunches should be finally looked over, and berries removed where they are at all crowded, so as to allow the air free passage through the bunches. Scalding has, I fear, been troublesome this season, owing to the changeableness of the weather, so that it will be advisable to air vineries freely, and keep a gentle warmth in the hotwater pipes, a small amount of air being afforded at night so as to allow of the escape of moisture, before the sun reaches the house in the morning. A buoyant atmosphere just before the colouring period is a good preventive of scalding in the berries. The outside borders will have had sufficient rain to moisten them thoroughly, but borders which have been a long time made will be better for a good dressing of Thomson's Vine Manure. Inside borders may be afforded the same, *Le Fruitier*, or farmyard liquid. Guano and fish manure answer well enough if applied after the berries are thinned. Syringing overhead must be done carefully, and if the water be impregnated with lime none should be allowed to touch the Grapes. Badly-rooted Vines, or those whose borders have been increased, should be allowed to extend their terminals, and the lateral points should not be cut back so much as is usual; and in the case of thin-skinned varieties which are apt to crack if greater freedom of growth be not allowed, this malady will be in great measure averted, especially if the border is not allowed to get excessively moist. Leaf mildew, sometimes troublesome about this date in houses that are badly ventilated, may be got rid of by sponging the leaves with warm water and flowers-of-sulphur, and maintaining a drier atmosphere, with more ventilation, and by keeping some slight warmth in the heating apparatus. Remember that precaution is better than cure. Red spider gives trouble when atmospheric moisture is reduced in amount, and the best way to get rid of it is by sponging the leaves if fruit is on the Vines, and by a thorough syringing with sulphur and warm water in houses where the fruit is cleared off. Shallow borders containing young Vines must be kept moist, or growth will be checked, and some kind of manure employed until such time as the Vines have made a sturdy growth. Allow them all the sunlight possible, if it be intended to force them early next season. Vines in pots for the same purpose must be liberally treated, all laterals stopped at the first joint, and the points also, when the Vine has reached a height of 6 to 7 feet. Shift young canes struck from eyes this season, and keep them growing with a high temperature in a moist house. Such Vines when well done are capital canes for planting, or for fruiting after being cut back. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

THE STOVE.—Plants of *Clerodendron Balfourianum*, which have gone out of flower, should be pruned in and placed in a genial growing temperature where there is sufficient head-room in the house or pit for the young shoots to run up to full length, without hindrance. When about 2 inches in length of new growth have been made, the plants should be turned out of their pots, and one-half of the old soil be shaken off, any long straggling roots being then cut back somewhat. Re-pot the plants in three-fourths rich fibrous loam, one-fourth of decayed manure, and sand in proportion. The potting should be done moderately firm. Place the plants where the shoots can be trained on pieces of twine 10 to 20 feet long, secured to the roof of the stove. Syringe the plants freely morning and afternoon whilst growth continues. Examples of this species of *Clerodendron*, which may be planted out in beds, and grown as roof or pillar-climbers, should also be cut down to about 10 feet from the base when they have finished flowering, and unless this be done annually, they will become crowded with useless flowerless shoots. Some of the surface-soil should be removed, and replaced with fresh materials, to which a liberal quantity of manure should be added.

POT ROSES.—Tea Roses which have been forced will, owing to the want of room, in many cases, have to stand outside during the summer, and will require to be gradually hardened off, if no harm

is to happen to them. The young leaves are very tender, by reason of the plants having been forced; and these are very sensitive to bright sunshine and drying winds. When placed outside, look over them every few days, and if mildew be noticed, forthwith dust over the affected parts with flowers-of-sulphur, or wash with some mildew antidote. Red-spider or the Rose-aphis should be kept at bay by tobacco-water, and the free use of clear water and the syringe.

The present is a good time to repot Roses which require larger pots or tubs; and, as a rule, the strong-growing sorts, if they are healthy, should have larger pots than weakly ones, but none should be over-potted—rather err on the side of small pots, &c. A strong loam, made rich with about one-fifth of decayed manure, with coarse sharp sand in proportion, makes a suitable compost for pot Roses. Make the drainage good, and put some rough fibry portions of the loam over the crocks, so as to keep out the soil. Pot firmly, using a potting stick. Stand the plants where they will have full sunshine, plunging the pots, if possible, in fine coal-ashes to the rims, which will keep the roots at a more equable temperature. In bright weather these pot Roses will be benefited by frequent overhead syringings with clear water.

ALLAMANDAS.—Large specimen *Allamandas* which were partially shaken out and repotted in fresh soil early in the year, will now require some kind of manurial stimulant, otherwise the bloom will become scanty in quantity, and the individual flowers small. Young stock raised from cuttings in the spring may now be potted into 10-inch pots. With sufficient heat, these plants will continue to bloom till late in the season, and form a succession to the older specimens, which were early started. *R. Milner, Penrice Castle, Swansea.*

THE KITCHEN GARDEN.

MUSHROOM BEDS.—Beds which were spawned four or five weeks ago, should now have the covering of litter carefully removed, and be supplied with water in quantity according to the dryness of the soil. Shake out the litter, and replace it lightly, and, if circumstances suggest it, thinner than before. Collect materials for making out-of-doors succession beds, to come into bearing in September and later. Spread them out in the sun, but cover up from rain. Prepared in this way, the dung is better than when its rankest heat and ammonia are got rid of by fermentation. Then see that the droppings are from corn-fed horses only.

ASPARAGUS.—Cutting should soon cease, and the plants be encouraged to make strong growth. Keep the beds weeded; afford frequently light dressings of agricultural salt when the soil is light; also during dry weather water heavily, occasionally using liquid manure. On heavy soil, salt, or strong manure should not be afforded, but frequent dressings of an artificial manure. Secure the stronger shoots to stakes, to prevent their being broken, and pull up all chance seedling Asparagus which would crowd the beds if they were left. To prevent the soil from cracking, mulch with leaf-mould, or the like. Keep the rows of Asparagus planted in the spring quite clear of weeds, and those which were sown at that season carefully hand-weeded, first thinning them out to 4 or 5 inches apart.

MISCELLANEOUS MEMORANDA.—Clear off any remains of crops, dig and prepare the ground for Turnips, Cabbage, Lettuce, Endive, &c. Brussels Sprouts, Broccoli, Kales, and Savoys may be planted out on land that has been under Peas or Potatoes.

To prolong the bearing of large-podded Peas, and have them of good flavour, closely pick all pods as soon as large enough for use, and water copiously with liquid manure and clear water. To provide for a full supply of large crisp vegetables, plentiful watering and occasionally a good soaking with farmyard or stable drainings will be of great use, the latter being carefully put on the soil between the rows—never letting it come in contact with the leaves. Mulching will be of use on hot shallow soils, employing grass-cuttings if nothing better may be obtained.

Peas and Cauliflowers are the first to suffer from drought, and need therefore early attention. Waterings should be by preference, always done in the evening, even if the men have to be paid overtime for doing it. Let all waterings be thorough, so that the moisture goes lower than the roots, or else they will come to the surface in search of it, and suffer from drought at times. By watering the crops abundantly at one time there is a real saving of labour, as the work need not be repeated

in less time than seven days, even if no rain should fall in the interval. Onions, Saladings, Cauliflowers, Peas, and French Beans are much improved by having the soil kept in a moist state in warm weather. Always afford water before the plants show signs of exhaustion.

If the Onion maggot has become troublesome, make a dressing with 2 lb. of soft-soap dissolved in 100 gallons of water, with $\frac{1}{2}$ bushel of soot tied in a bag and allowed to soak in the same for twelve hours. Apply this to the bed with a rose water-can; it will keep the maggot in check. Mulch the beds, well water them in dry weather, and occasionally dust them over with soot. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

VANDAS.—The species *V. suavis* and tricolor should now have a shading of thick whitening placed on the glass, which will keep the plants cool also, and temper the strong light, which would soon take the colour out of the foliage, and with the colour the health of the plant also. Plants should be encouraged to start into growth by affording warmth and moisture. *Vanda Amesiana* grows best in a house having a cooler temperature than suits *suavis* or tricolor. The lovely *V. Kimballiana* is greatly benefited by overhead waterings during growth, and it should be stood where the circulation of air is sufficient to dry them up at least once a day, and if they should dry up very quickly, I find that three or four syringings afforded during the day have a good effect on the health of the plant.

CATLEYA HOUSE.—The work in this section will, for the present, be of a general character. A few plants, it is true, consisting principally of *C. gigas* have to be repotted, which is best performed directly the flowers have faded. Late flowering *C. Mendeli* and *C. Mossii* may also be repotted, if requiring it, and as late as the middle of the present month; later than which it is inadvisable to repot large *Cattleyas*. For a number of years I have been in the habit of repotting *Cattleyas* in the summer, the reason for doing which is very simple—in the new compost the young roots freely extend to the sides of the pot, it is then that the new pseudobulbs grow apart. The potting compost may consist of three parts brown fibry peat, one of sphagnum moss, and one of clean crocks, the latter being far to be preferred to charcoal, which, after being covered with the compost for some time, gets sodden, and the roots, although they do at first adhere to it, in a very short time rot away—and this disaster does not occur with crocks. In speaking of this circumstance to some gardening friends, I have had the sweetening properties of charcoal pointed out to me, and I admit that it does this. I have during the last fifteen years had the opportunity of turning out some plants from most of the collections of Orchids that have been sold during that period, and after studying the matter in a practical manner, I am certain that the use of charcoal in Orchid growing is a mistake. Care in the shading of the plants is now very necessary, and it is a matter that should not be lightly passed over.

I have in a previous calendar pointed out that position in a house is a point of much importance, and ought to be studied. *C. Percivaliana* should be stood in a position where it commands full sunshine, and can be syringed overhead at least twice a day. It is a good plan before fully exposing the plants, to place a sheet of tissue-paper over the foliage, and watch during the warmest part of the day, when it will be seen if any bubbles in the glass have escaped notice. By doing this, the burning of the foliage may be averted. *C. lobata*—or, as it is more generally known now, *C. Boothiana*—is another plant which is the better for a certain amount of sunlight whilst growing. It is a plant which should have *C. gigas* treatment to flower it successfully, but it is undoubtedly a little bit more difficult; and no water should be afforded the plants after the young pseudobulb breaks away until it can be seen if a sheath is coming in the young growth or not. As soon as this can be determined, water may be applied in either case, and the plant exposed to full sunshine, overhead syringing being resorted to, to avert the shrivelling of the pseudobulbs owing to the dry state of the potting compost. *C. Gaskelliana* will now be coming into flower, at least the earlier-flowering plants. It is a grand introduction, flowering, as it does, from midsummer to December. *C. Warocqueana* is a fine addition to autumn-flowering *Cattleyas*. The temperatures of all the houses may remain as given in my last calendar. *A. G. Catt, Parkfield, Hallou, Worcester.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, JULY 11—Royal Botanic Society. General.

SHOWS.

TUESDAY, JULY 7
Royal Horticultural Society's Exhibition and Conference on Hardy Summer Perennials and Small Fruits, Chiswick Gardens (two days).
Gloucester.

WEDNESDAY, JULY 8
Royal Botanic Society's Evening Fête, 8—12 P.M.
Portsmouth (three days).
Ealing.
Sutton.
Parsloey.
Hitchin.
York Ancient Florists.

THURSDAY, JULY 9
Bath.
Chichester.
Woodbridge.

SATURDAY, JULY 11
Galashiels.
New Brighton.

SALES.

TUESDAY, JULY 7
Flowering Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.2.

The Potato Disease.

We are now close upon the time when we may expect a visitation from this pest. Let us hope that the atmospheric conditions may be such that the fungus may develop itself only feebly, and not induce much injury to our crops. We cannot, however, rely on any such immunity, and it therefore behoves us to be ready, not only to act on the first appearance of the disease, but at once to adopt measures of precaution. It must be remembered that there is now no excuse for apathy and quiescence. The nature of the plague is known, if not in all its details, at least to such an extent that we know how to combat it with rational means, and with a large amount of certainty as to the issue. High moulding, as recommended by Mr. JENSEN, is productive of excellent results, and will, as the Chiswick experiments testify, secure a crop even when the haulm is a mass of putrescence. How much larger that crop might be if the moulding were applied earlier, we leave our readers to judge. If farmers and large growers do not think it worth their while to adopt this simple expedient, at least, there can be no question that the small grower and the cottager will find it worth his while to secure a partial crop when otherwise he would have none.

There is another way of looking at the matter. Has anyone the right, now that the means of control are within his power, to fold his hands and allow his neighbour's crops to be ruined

because he is too inert or too sceptical to adopt these means? Still more, has anyone the right to continue to directly propagate the disease by neglect and carelessness, as 'tis still, we are sorry to say, all but universal among growers? Surely the conscience of cultivators should preserve them in the future from what was formerly unavoidable, but which now is, to our thinking, not less than criminal.

Another method of combating the disease, is that by means of salts of copper. We have seen this tried on a small scale with the Tomato fungus; and our colleague, M. PRILLIEUX, a highly competent authority, has tried it on a large scale with the Potatoes in France. The proportions in which it should be used are:—3 lb. of sulphate of copper, 1 lb. of quicklime, 20 gals. of water. Dissolve the sulphate in water in a wooden tub. Slake the lime in another tub, and mix it with the copper solution. Keep the mixture stirred, and apply the whole with a spray pump, such as was figured in our issue, May 30, 1891. On a large scale the proportions to be used are:—Sulphate of copper, 20 lb.; lime, 10 lb.; water, 100 gals. Another receipt which some French experimenters prefer is:—Copper sulphate, 4 lb., dissolved in 3 gals. of water; add 6 lb. of carbonate of soda to the solution, and $\frac{1}{2}$ lb. of treacle. Stir the mixture, allow it to remain for twelve hours, and then dilute with 22 gals. of water.

The effect of the lime in the one case and of the soda in the other, is to form either an oxide or a carbonate of copper, which is deposited by the spray on the foliage, and effects the destruction of the fungus. In an article by Mr. WHITEHEAD in the present number of the *Journal of the Royal Agricultural Society*, we find the copper solution recommended to be employed at the rate of 140 to 150 gallons per acre at the end of June, and again four weeks later. In any case it should be applied immediately a spot of the disease is seen.

The same substances may be employed, with or without an admixture of sulphur, in the form of a dry powder dusted on to the foliage with a distributor, in the same way that sulphur is used for the Oidium of the Vine, and as recommended by Mr. TAIT, of Oporto. We have no experience of the use of the powder on the Potato fungus, but if it be very fine and evenly distributed, there can, we think, be no doubt as to the result. For the Lily-fungus this would be very suitable. Owing to the mode of growth, and the life-habits of the fungus, it must not be supposed that any of these remedies will completely destroy the fungus. All that is claimed is, that it can be so thoroughly kept in check that a satisfactory crop can be secured where otherwise there would be none, or next to none.

It is very difficult to induce people, even in their own interests, to make trial of remedies of this kind. For our own parts, we have continually urged the matter upon our readers for years past, and we rejoice to find the Royal Agricultural Society and the Fruit Growers' Association at last pursuing the same course.

Mr. WHITEHEAD'S article contains within a small compass the results of the experiments of RILEY and others, and should be reprinted and circulated broadcast without a day's delay.

CYPRIPEDIUM ROTHSCHILDANUM.—This is one of the most stately of recently-introduced Cypripediums, and its free habit of growth, and the certainty with which it may be counted on to produce its beautiful flowers, has caused it to steadily increase in favour, as the plants imported by

Messrs. F. SANLER & Co. into this country have increased its strength, and thus revealed the merits of this quaint and original species. In colour it is as quaint and attractive as in shape, the lighter colour being yellowish-white to pale yellow, and the darker chocolate colour tinged in parts with crimson. *C. Rothschildianum* grows very freely in a warm moist house in which the other hot-house species, such as *C. Lowii*, *C. Stoneii*, *C. Sanderianum*, &c., are kept. The specimen illustrated (fig. 3) was exhibited by NORMAN C. COOKSON, Esq., Wylam-on-Tyne, at the Royal Horticultural Society in May last.

LINNEAN SOCIETY.—At the meeting held on June 18, Professor STEWART, President, in the chair, Messrs. HERBERT JONES and JOHN BIDGOOD were admitted Fellows of the Society, and Mr. C. W. SLATER was elected. Mr. W. H. BEEBY exhibited specimens of *Hieracium protractum* and other plants collected in Shetland. Mr. STUART SAMUEL exhibited a dwarf specimen of *Acer palmatum*, and made some remarks on the dwarf trees artificially produced by the Japanese. Mr. R. V. SHERRING showed some cases of dried Bananas, and described a new method of preservation adopted in Jamaica to save waste of small parcels of fruit which would be otherwise unsaleable. Mr. A. W. BENNETT exhibited and made remarks upon a specimen of *Selaginella lepidophylla* which was found to possess remarkable vitality, and upon proper treatment to resume its normal appearance after having been gathered some months. Dr R. A. PNIOR exhibited samples of the spiked Star of Bethlehem, *Ornithogalum pyrenaicum*, and stated that although described in British floras as a rare plant, it is so abundant on the hill pastures around Bath that it is brought to the market there in large quantities under the name of French Asparagus, and sold for a penny a bunch. Mr. R. A. ROLFE showed two hybrid *Odontoglossums* with the parent plants, namely *O. Wilckeanum* (produced from *O. crispum* and *O. luteo-purpureum*), and *O. excellens* (produced from *O. Pescatorei* and *O. triumphans*). These had first appeared as natural hybrids out of imported plants, and the parentage was subsequently ascertained under cultivation. A paper was then read by Mr. SPENCER MOORE on the true nature of Callus, and in continuation of former remarks on the same subject (*Ann. Soc. Journ. Bot.*, vol. xxvii., No. 187, 188). He showed that the outer sieve-plates of the Fig are obliterated by a substance giving all the dye reactions of callus, which does not peptonise, and will not yield proteid reactions. Many of the inner sieve-plates he found to be stopped up with a proteid callus resembling in every way the substance of ballus stoppers, and the proteid callus of the Vegetable Marrow. It appeared that true callus would dissolve in a solution of gum arabic, but whether by agency of a ferment or of an acid, he had not yet determined. A second paper by Mr. SPENCER MOORE dealt with the alleged existence of protein in the walls of vegetable cells, and the microscopical detection of glucosides therein.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Hotel Windsor on the 26th ult., WILLIAM MARSHALL, Esq., in the chair. The Hon. Secretary reported that the balance at the bank was £501 16s. 2d.; also that he had received several of the collecting cards sent out for the national collection, and, judging from the average amounts, there was every prospect that the collection would result in a considerable addition to the funds. The usual quarterly allowance to the thirty-nine children at present on the Fund, amounting to £126 15s., was ordered to be paid. The details of the Rose Fair and Floral Fête at the Crystal Palace on July 15 were arranged; many promises of support had been received of Roses and other flowers for sale, and groups of plants to add to the attractions of the fête. The committee are in treaty with the railway companies, and there is every probability the success the committee so much desire will attend their efforts.

THE EYOT AT KEW.—It rests with the public whether one of the most beautiful spots in the whole course of the Thames shall be preserved or not. If it were a case of destruction merely, the loss would not be so serious as it will be under existing circumstances. It is not only the annihilation of the most beautiful scene of its kind near London, but it is the exposure in all its hideous repulsiveness of the river bank at Brentford. We are glad to see our contemporary, the *Richmond Times*, taking the matter up; but this is not a merely local question, it concerns the metropolis at large, and all those who delight in the river and its amenities. We should gladly hear of a vigorous protest on the

extract from the *Richmond and Twickenham Times* shows that the matter is attracting local attention, but, as we have said, the subject is one which affects the whole metropolis, and the visitors to it:—

"House of Commons.
"To King, *Richmond and Twickenham Times*, Richmond.—In reply to my question this afternoon, the Government are perfectly willing to confer with the local authorities with the object of saving trees on Brentford Eyot.
JAMES BIGWOOD."

From a report subsequently received, it appears that Mr. Bigwood asked the First Commissioner of Works whether the Department were now asking for tenders for the purchase of standing timber on

MORREN'S *Correspondance Botanique*, but in a smaller and less expensive form. In the interests of science, botanists of all countries are requested to inform the editor of all changes and corrections. We would suggest to him that he should in future years follow Professor MORREN'S plan of sending the proof-sheets to some competent correspondent in each country for the purpose of revision. Had this been done in the case of Great Britain, many errors would have been avoided, thus:—Mr. DYER'S address is not Kew Garden Road, Mr. HEMSLEY no longer lives at Cambridge Road, Chiswick. The Royal Horticultural Society has no garden at South Kensington. Mr. BOULGER'S address

FIG. 3.—CYPRIPEDIUM ROTHSCHILDIANUM. (SEE P. 14.)

part of the press, of a deputation to the Office of Woods and Forests, of "a question in the House," or of any means which may be considered most effectual for the preservation of this little islet. It is, by the way, far more beautiful than that in the lake of Geneva by Chillon, of which BYRON sang. If the sentiment of romance is lacking in the Brentford "Ait," that attaching to its beauty should be strong enough to prevent the threatened destruction. What is wanted is some protection by "camp-shedding" or otherwise, so as to prevent the washing away of the banks by the steam-tugs and launches. Were the "eyot" placed under the direction of the authorities at Kew, it might with advantage be turned to account as a salicetum. The following

Brentford Eyot, and whether he was aware that people in the neighbourhood, who were anxious to preserve these trees upon that island, were willing to pay all expenses towards the safe maintenance of them in their present position. Mr. JACKSON was not aware that tenders were out for the purchase of the timber. The Commissioners of Woods would be glad to hear from the persons referred to in the question, and if they could meet the wishes of the local authorities they would do so.

BOTANISCHES ADRESSBUCH.—Mr. W. ENGELMANN, of Leipzig (Königstrasse, n. 10) has published a list of living botanists, botanic gardens, societies, and journals, on the plan of the late Professor

is not at Landbroke Grove. Mr. JOHN GINSON is not "gardener in the Hyde Park," Mr. "A. MACYNTRE" is not the Superintendent of the Victoria Park, nor Mr. ROGER of that of "Bettersea." Three nursery-men are mentioned—a circumstance which makes us wonder why more were not included. The Royal Microscopical Society is no longer housed in King's College. "Dr. MAXWELL F. MASTERS" is not the Secretary of the Royal Horticultural Society; nor is "Dr. F. MAXWELL MASTERS" the name of the Editor of this journal. The *Annals of Natural History* is not edited by Mr. W. S. DALLAS, and the name of Mr. T. A. BRIGGS should be deleted from the lists of living botanists. The term "florist" is moreover used in this country in a very different sense from that in which

it is employed by Continental botanists. Although we have pointed out these errors, and might have mentioned many others, we by no means do so with any wish to disparage what is really a most useful publication, and one which may be made still more so. Had the editor consulted the *Kew Bulletin*, or the revised list published in our number for January 17, 1891, he might have avoided several of the errors we have noted.

KOLA NUT.—Generally speaking, the virtues attributed to newly-introduced drugs or articles of food require to be as severely discounted as if they were patent medicines. This precaution is hardly needed in the case of the Kola nut, provided the nuts are in a fresh wholesome condition. The power of the nut in enabling the partaker to undergo prolonged fatigue, whether of body or mind, and protracted abstinence from food, is established beyond question. The military authorities in India are likely to adopt it in cases of military expeditions, where food is scarce and difficult of carriage. We allude to the subject on the present occasion in order to suggest that a trial be made of it in the hay-field and among harvesters. In the form of chocolate it is very serviceable, as we can testify in the obviating and lessening the fatigue of prolonged mental exertion; but in the field "Kolatina" mixed with water or milk would, of course, be preferable. Kolatina contains 40 per cent. of Kola. Messrs. THOMAS CHRISTY & Co., of 25, Lime Street, are willing to supply quantities sufficient for experimental purposes, as there is no fear of ill results, but a strong probability of its forming an excellent substitute for beer. We have spoken of Kola as if it were new—this is hardly correct—the tree and its virtues have long been known to botanists, but it takes a long time for the general public to become acquainted with such matters.

GARDENERS' ORPHAN FUND.—We earnestly call the attention of our readers to the Rose Fair and Floral Fête to be held at the Crystal Palace on Wednesday, July 15, for the benefit of the Gardeners' Orphan Fund. The admission to the Palace is one shilling only. Among the items of the programme, in addition to the display and sale of Roses, are:—Cricket match: the Seedsmen v. the Gardeners of England, two organ recitals, two concerts by the renowned Crystal Palace orchestra, promenade music by the Crystal Palace military band, grand fountain display, two performances by the trained wild animals, monster balloon ascent, illuminated garden fête and grand open-air ballet, and other popular attractions all day. Tickets may be had at most of the florists, from the Secretary, Mr. A. F. BARRON, Royal Horticultural Society's Garden, Chiswick; or from the Publisher of this Journal, at this office. Those applying for tickets by letter should take care to pay postage, and to specify by which route they wish to travel. The high-level route is that by the London, Chatham, and Dover lines; the low-level route is that by the Brighton Company's service.

MR. HIBBERD'S LIBRARY.—The sale, by Messrs. SOHBEY, WILKINSON & HODGE, took place on the 29th and 30th ult., of the library of the late Mr. SHERLEY HIBBERD. A large number of Archaeological books, and books of travel, were included among works relating to botany and horticulture. Among the prices obtained for books in the latter category we may note the following:—Sweet's "Cistinea," £1 10s.; Sweet's "Geraniaceae," 5 vols., £2 18s.; Lindley's "Pomologia Britannica," £1 14s.; a copy of the first edition of "In Memoriam," £1 14s.; a complete set of the "Botanical Register," in 34 volumes, fetched £36; Seemann's "Flora Vitiensis," £2 6s.; "The Herefordshire Pomona," £5 7s. 6d.; Elwes' "Monograph of Lilies," £7 10s.; Wallich's "Plantae Asiaticae Rariores," 3 vols., £14; Ravenscroft's "Pinetum Britannicum," 3 vols., £9 10s.; Turner's "Herbal" (1568), £19 10s.; Gerard's "Herbal," £1 12s. (incomplete); Paxton's "Magazine of Botany," 16 vols., £11 10s.; a com-

plete set of the "Botanical Magazine," £99; Masters' "Vegetable Teratology" and two other books, 26s.; Loddiges' "Botanical Cabinet," 20 vols., £7; "Flore des Serres" (Van Houtte), 23 vols., £18 10s.; Parkinson's "Paradisus" (imperfect), £6 12s. 6d.; "Gardeners' Chronicle" (complete to 1889), £15 10s.; "Gardeners' Magazine," 40 vols., £1 7s.; "The Garden" (nearly complete), £3 11s.; "Journal of Horticulture," 50 vols., 16s. The amount realised was, we believe, a little over £800.

M. F. HÉRINCO.—We learn from the *Revue Horticole*, of the death of this gentleman, at the age of seventy-one. M. HÉRINCO was one of the conservators of the botanical collections in the museum at the Jardin des Plantes, at Paris. He was known to horticulturists as the editor of the *Horticulteur Français*, a publication now defunct, but in its time remarkable to us Englishmen, at any rate, for the raciness and vigour of its language. M. HÉRINCO contributed to the *Manuel des Plantes*, a work corresponding to LONDON'S *Encyclopædia of Plants*, and he rendered great assistance in the preparation of the late M. LAVALLÉE'S fine work, entitled, *Arboretum Segrezianum*.

LILACS.—The *Revue Horticole* contains the commencement of a monograph on the species of *Syringa*, from the highly competent pen of M. FRANCHET. With regard to the native country of the common Lilac, which is still a matter of dispute, M. ANDRÉ states that he has lately seen the plant growing wild in abundance on the mountains separating Servia from Bulgaria. The tree was growing in the company of *Staphylea pinnata*, *Coronilla Emerus*, and other spring-flowering shrubs, among which were also mixed the pretty flowers of *Limaria annua* and *Adonis vernalis*.

EALING GARDENERS' ASSOCIATION.—The third annual trip of the members of this body took place on Monday last, June 29; and Dropmore was selected as the place of resort, by the kind permission of Lady LOUISE FONTESCUE. Dropmore is a most enjoyable place, particularly at this season of the year. A very pleasant day was spent, the party much appreciating the courtesy and attention paid to them by the late PHILIP FROST'S successor, Mr. C. HERRIN.

PINKS, ETC.—These flowers make a good show in the Royal Horticultural Society's gardens at Chiswick at the present time. Mrs. SINKINS, white, maintains its character as a good grower; Her Majesty, sent out a year or two ago by HOOPER, is in capital form, and Modesty (TURNER), is a beautiful white blotched with light purple in the centre, very free flowerer. Fuchsia Dunrobin Bedder (MELVILLE), certificated last year, is doing well planted out in a bed or two. It is a free-flowering dwarf form of the old F. Riccartoni.

DEATH FROM DRINKING WEED-KILLER.—Another case of fatal poisoning by a weed-killer occurred at Warnford Park, Hampshire, recently, W. NORRIS, a carpenter employed on the estate, having drunk a quantity of the liquid inadvertently. Too much care cannot be taken with these dangerous compounds; but we fear that until some one is severely punished for neglecting to keep them out of the reach of persons ignorant of their dangerous nature, these "poisonings by misadventure" will be constantly occurring.

FLOWERS IN SEASON.—We have received some magnificent spikes of Delphiniums, Herbaceous Peonies, and Pyrethrums, from those excellent cultivators of hardy perennial flowers, Messrs. KELWAY & SONS, Langport, Somersetshire. Among the first-named is a bright blue-coloured flower—Britannia; a purple and blue—David; a corulean blue—Bester; and one nearly similar in colour, but better, named Ida. A fine double crimson-coloured Peony is seen in Prince George; a bold single-flowered pink variety in Calliphone; and an excellent blush, of full form, in Princess of Wales. Miss Salway is a pure double white. Gaillardias, with fluted and

with plain florets, were gorgeous in orange, yellow, red, and crimson.

THE BULB CROP AT HAARLEM.—We learn from one of our correspondents that the weather here has lately been very sunny and warm, so that the growers are now very busy in harvesting the early Tulips, which are, in spite of the past long severe winter, and of the cold spring, very good, and the flowering qualities being very promising. The Hyacinth fields look better than for the last two years.

FRUIT CULTURE.—The Fruiterers' Company (of which Sir JAMES WHITEHEAD is Master) has obtained from the LORD MAYOR the use of the Egyptian Hall of the Mansion House for the purpose of holding a meeting on July 13, to consider what further steps shall be taken in the promotion of fruit culture in homesteads and cottage gardens. Among those who have already expressed themselves interested in the movement, and have contributed towards the fund for carrying out its objects, are the Corporation of London, the Duke of Westminster, the Duchess of Grafton, the Earl of Dartmouth, Lord Wolverton, Lord Crewe, Lord Savile, Lord Hothfield, the Baroness Burdett-Coutts, Mr. W. H. Smith, M.P.; and the Mercers', Drapers', Clothworkers', and Leathersellers' Companies. The Medals and Certificates awarded at the great exhibition of fruit in the Guildhall last year will be presented on the occasion, and the LORD MAYOR will preside.

GROWING ALPINES IN SPHAGNUM.—We have received various letters on this subject, and another article from M. CORREYON, which we shall publish in our next issue. The matter is one of great importance, as showing that these plants can be grown under conditions not heretofore thought possible.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We may again remind our readers that the Annual Festival is to take place on Wednesday, July 8, at the Hôtel Métropole, Northumberland Avenue, at half-past 6 o'clock. The Right Hon. JOSEPH CHAMBERLAIN, M.P., will take the chair, and he is so good an horticulturist that we trust a large company will be present to meet him, and to increase the labours of the Treasurer and of the new Secretary.

ROSE SHOWS TO COME.—Mr. E. MAWLEY, of Rosebank, Berkhamsted, Herts, wishes us to publish the following list of Rose shows because of changes of date having been made in several shows since his last list was published. July 7 (Tuesday), Diss and Gloucester; 8 (Wednesday), Hitchin; 11 (Saturday), Eltham, New Brighton, and Reigate; 14 (Tuesday), Wolverhampton (a three days' show); 15 (Wednesday), Ealing; 16 (Thursday), Hereford (N.R.S.), Bedford, Helensburgh, and Trentham; 17 (Friday), Ulverstone; 21 (Tuesday), Christleton and Tibshelf; 23 (Thursday), Halifax and Worksop.

FLOWERS IN HYDE PARK.—The hardy Azaleas being over, Rhododendrons form the principal floral display at the present time; the bulk of them have been temporarily planted by Mr. A. Waterer on either side of Rotten Row, forming a very pleasing feature. Although the number of these beautiful shrubs is small, in comparison to what may be found in large gardens in the country, they are made the most of, and every year selected plants are brought. It is a pity that in a place like Hyde Park, where so many thousands of people see them, they are not permanently planted out to a larger extent, as nothing would add more to the beauty of park scenery than Rhododendrons in bloom in large masses. Among the best varieties in bloom was John Waterer, still one of the most showy, having very large trusses of bright scarlet flowers; Michael, with flowers of bright crimson-scarlet; Minnie, white, with chocolate spots; Marchioness of Lansdowne, a very distinct variety of pale rose, heavily spotted with black; Madame Carvalho, white; and Lady Eleanor Cathcart, pale rose, finely spotted; not forgetting the old R. fastuosum, which may not be such a striking variety as some of the others, yet it is about the best for planting around London, as it rarely fails to set a

good crop of flower-buds, even in the most unfavourable localities. The bedding-out is almost finished, much of it being quite established, and gives good promise of a fine display; especially fine are the beds of Roses, which are very thickly covered with buds. The fashions in this department seem to change very slowly even in such a fashionable place as Hyde Park, as the same style and arrangement may be observed that has been in use for a considerable number of years. The mode of plunging specimen plants of Fuchsias, Pelargoniums, Heliotropes, Plumbago capensis, &c., in the turf, is one to be admired, as it shows off the plants to the best advantage. The carpet-bedding has, if anything, a little too much colour in it produced by the red varieties of Alternanthera, but otherwise it is well done. Among the summer bedding the most pleasing effect is produced by planting good-sized plants of ivy-leaved Pelargoniums on a ground-work of blue Violas or other dwarf-growing plants, with the usual harmonious edgings.

BURTON FLOWER SHOW.—The first show of the season in connection with the Burton Horticultural Society took place on Wednesday, June 24, proving a success in every way. Owing to the season, the exhibits of fruit and vegetables were not so good as in former years, but the floral display was unusually good, the competition being very keen. In the open classes there were some very fine specimens sent by Mr. Cypher, Mr. Webb, and other well-known exhibitors. In the amateur classes the competition was also very good, and the exhibits were of good quality that would have been creditable at horticultural shows anywhere.

CYTISUS SCOPARIUS ANDREANUS.—At the Exhibition of the Midland Pansy Society, in Birmingham, Messrs. R. H. VERTEGANS & Co., exhibited several specimens profusely in flower, at 18 inches high, and in 48-pots, of the above plant. These were grafted plants imported from the Continent.

WOODBRIDGE HORTICULTURAL SOCIETY.—The above Society will hold their 40th Annual Show, July 9, at which £150 is offered in Prizes, and also National Rose Society's Medals. Next year a 25-guinea Silver Cup will be offered for Roses.

LORD RANDOLPH CHURCHILL'S BOTANY.—The noble lord, the hon. member for Paddington, is globe-trotting, and is contributing a series of papers on "My Trip to Mashonaland" to the *Daily Graphic*. The letters, if the first may be taken as an example, will prove interesting, but somewhat "shaky" from an horticultural point of view, as the following letter from Mr. W. ROBERTS, of 63, Chancery Lane, to the *Pall Mall Gazette* of a recent date shows:—"Lord RANDOLPH CHURCHILL expresses, in his first letter, from which you quote a paragraph in this evening's issue, that 'horticulturists and botanists may be interested with some of the trees and plants which I will particularise.' They will, but I am afraid that his lordship's information in this respect will not enhance their opinion of him. If he will tell us something which the most juvenile of gardeners' apprentices do not know, perhaps his labours will not be entirely thrown away. Lord RANDOLPH'S nomenclature resembles to a certain extent Mr. WELLES's knowledge of London—it is decidedly peculiar. By 'Combretum (*sic*) coccinium' (*sic*), which is 'novel' to the traveller, is, I suppose, intended *Poirvea coccinea*, a synonym of which is *Combretum coccineum*, a plant which is well known in English gardens, and has been in cultivation here for nearly three-quarters of a century. It has been figured (notably *Botanical Magazine*, tab. 2102) and described many times in the horticultural press. Lord RANDOLPH will be able to obtain plenty of plants in this country. 'Olea fragrans' looks well, but readers of *My Trip to Mashonaland* would understand what was meant much better if the simple name of 'Olive' were given. 'A splendid Schotia' and 'Bougainvillia' (which should be

Bougainvillea) do not convey any very definite idea to the horticulturist, for there are several species of each genus in cultivation. The same may be said of 'Francisia,' which, when spelt correctly, *Franciscea*, is a mere synonym of *Brunfelsia*, and in an intensified degree of *Grevillea* (which Lord RANDOLPH gives as 'Grevillia'), of which there are nearly thirty species to be found in cultivation. The description of *Strelitzia reginae* as 'apparently a sort of Banana' is very rich, but it is also not altogether incorrect. Good also would the information be respecting the perfume given off by Camphor leaves when crushed in the hand—only one would have supposed that the proverbial schoolboy knew of this quality. Clearly Lord RANDOLPH'S trip will be a failure as regards the horticultural part of it if he does not charter at once a professional botanist."

CHRYSANTHEMUMS IN SYDNEY.—A correspondent obliges us with a newspaper-report, two columns long, of a Chrysanthemum show in Sydney, in May. "Judging from the great interest which was taken in the show of last week, there can be no doubt about the popularity of the Chrysanthemum in Sydney and its suburbs. The progress made in the development of the flower has been very great during the last year or two, and no doubt this will continue, especially with regard to the cultivation of Chrysanthemum plants in pots, for one of our gardeners has proved beyond all question, and contrary to the expectations, that specimen plants in flower can be raised here equal to any in the world, and Mr. G. KERSLAKE, gr. to Mr. W. VON DER HEYDE, of Homebush, is to be congratulated on being the raiser of the finest specimens ever seen in this colony, or perhaps in any of the colonies. Next season we may safely expect to see more equally successfully grown plants from other growers, although everyone cannot expect similar results from their first endeavours, for there is a great deal to learn before success can be attained." [It is of little use, we fear, to repeat that our colonial friends would do much better service in developing their own resources than by imitating European fashions. ED.]

THE NATIONAL FLOWER OF THE UNITED STATES.—According to a paragraph circulating in the American newspapers, what that country needs most of all just now is a national flower. There seems to be a wild yearning for the adoption, as distinctively American, of some member of the flower family; but the difference of opinion as to the flower to be selected for that honour is remarkably wide. The following list of blossoms, favoured by different people, shows that anything like unanimity of selection is impossible. The young man looking for a rich wife prefers the Marigold. Bill collectors favour the Forget-me-Not. Temperance people select the Water Lily. The telephone girls think the "Aloe" most appropriate. Informers and spies like the "Peach" blossom. Anglomaniacs think Pennyroyal most suitable. Men who want to emphasise America as the country of railroads wish to adopt the Carnation. Pipe manufacturers are fond of the Tuberosa. Milkmen fancy the Cowslip; pruders, the Primrose. Aged people naturally select the Elder blossom. Sage is preferred by wise men. Golden Rod seems to suit millionaires best. The penman, whose Christian name is John, will vote for the Jonquil. Virginia Creeper is the picanninies' selection. Builders take to the Wallflower. Lovers are understood to prefer Tulips.

POLLARDING THE TULIP TREE.—Sometimes the question of pollarding the Tulip tree will arise; and we read in MÖLLER'S *Deutsche Gärtner Zeitung*, of a correspondent of that journal who made a trial with a stout tree which had lost its crown in a thunderstorm. To form a symmetrical crown, the limbs which remained uninjured were headed back in the following winter. Strong sappy shoots were formed the next season, which were killed for a considerable proportion of their length by the frost the next winter, and this was repeated for several years,

but not so severely. At length the wood having become weaker, ripened thoroughly, and flowers were put forth. From the above, it would appear that the pollarding of *Liriodendron tulipifera* is not advisable, at least in countries having very severe winters.

IRIS ROBINSONIANA.—This Iris, of which we gave a figure recently, is now in bloom in the succulent-house at Kew, and those who wish to see it should not delay their visit. The plant has the habit of the New Zealand Flax, sends aloft a stately panicle of flowers, of which many are in bloom at once. The individual blooms are, for an Iris, of medium size, of the purest snow white (*Cygnus candidior*), with a central blotch of clear gold. The name given by the Australians to this Iris, that of Wedding Flower, is not inappropriate. The plant is a native of Lord Howe's Island, and in habit and general appearance very unlike an Iris. The flowers, however, proclaim its lineage.

FOREIGN CORRESPONDENCE.

DENDROBIUM PHALENOPSIS.

The very large quantity of *Dendrobium Phalaenopsis* just coming into flower at the establishment of Messrs. Linden, Brussels, is certainly noteworthy. There are sufficient in flower to notice a variety of shades of colour, and from the fact that it is a six-weeks' flowering Orchid, like the *Odonoglossum Alexandra*, it must prove a valuable flower at this season of the year especially, and on till the month of October, as the flower-spikes well indicate at present. The varietal name, *Phalaenopsis*, seems well chosen, each individual flower resembling a dark variety of *P. amabilis*. An idea that it will become a favourite, if not a marketable plant, is general with those who have seen it in quantity as here. *H. K., Laeken.*

HOME CORRESPONDENCE.

CREAM-COLOURED BROOM.—I send you here-with some sprays of a very distinct cream-coloured Broom, of which I discovered a solitary bush in this locality, where the common yellow is very plentiful. It is regarded here as altogether a novelty, and as it is new to me, I should be glad of your opinion, so that I may arrange to secure seed if worth while. *Chas. T. Drury, F.L.S., Aberfeldy, N.B.* [Pretty, as a variety, but doubtful if it would come true from seed. ED.]

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—When I read the appeals made for assistance by this noble institution for assisting aged and necessitous gardeners and their widows, the idea has often struck me that in the season of flower shows someone should take up the subject of having a stall at every show for the sale of button-holes, and bouquets at cheap prices, say a penny, two-pence, or even threepence each, the proceeds of such sales to be added to the funds of the institution. If ladies and gentlemen who have gardens would make small gifts of flowers, and allow their gardeners to make up nice little sprays, for ladies' wear, for sale, and send them to the secretary on the show day, it might also help to realise a sufficient sum to place some deserving person on its funds. Secondly, if collecting boxes were put in conspicuous places at the shows, for contributions to the Gardeners' Benevolent Institution Fund, with an inscription, in large letters, showing the object of the stall and boxes, visitors who may not have known of the existence of the institution would willingly, in many cases, contribute. I know from experience, when going round with a collecting card last year, in places where people never trouble to read books or buy garden papers, they have no knowledge of the wants of this or other institutions. Gardeners with a family have little to spare out of their wages after paying to their sick and benefit clubs, and keeping themselves respectable, and cannot give the help they would like to their brother-craftsmen in distress. And, lastly, I hope all those whose sole object in showing is prize-money, will not forget to give their mite to the Gardeners' Royal Benevolent Institution. *J. W.*

HARDINESS OF ALOYSIA CITRIODORA.—We have had many of the so-called hardy trees and shrubs killed during the past winter, but the above plant, better known as the Lemon-scented Verbena, has withstood the winter's cold, unprotected in any way, and is now growing away as if nothing had happened. *J. Maers, Chymoroad, Marazion, Cornwall.*

BOLTING OF CABBAGES.—In your issue of the 13th ult., a correspondent gives an account of the state of the spring Cabbage crop in Scotland and in the north of Ireland, from which it would appear that this crop will prove a loss to many growers owing to the plants "bolting." Your correspondent ascribes this to three causes, viz., "the selection of unsuitable varieties; sowing too early; and the effect of the severe winter upon the vitality of the plants." Referring to the varieties, Etampes is mentioned as being "too tender to endure even mild winters in Scotland." Now, although residing considerably further north than the Lothians, and having grown that variety year after year since it was first sent out, I must say that it is considered here one of the hardiest of the early sorts, and the one that is least liable to "bolt." This was our opinion from the first season, but since then the seed has been saved at home, having made a start with one good head out of a thousand. This year out of ten thousand plants twenty have not "bolted," although exposed to biting east winds and a long continuance of frost without a pinch of snow to cover their nakedness; indeed, between vermin and weather there was scarcely anything left when April came in but the stems and mid-ribs—but in spite of all hardships they are now doing splendidly. The seed is sown, if possible, on July 11. In spring, a top-dressing of soot is given, but no artificial manure is used, as, although forcing for one year might not cause early flowering, it might have that effect on plants grown from seed of a strain which had been forced for a number of years. Like the McEwan's variety, which your correspondent mentions, a few of the Etampes will hold on, even the second year. Last season, a two-year-old stock produced the largest head I ever saw in early Cabbages. On going through the plots to-day, I find that a number of those sown in July, 1889, are heading beautifully, without any appearance of breaking out into bloom; and one or two throw out an arm of bloom on one side, and a good head of Cabbage on the other. I have sent per parcel post a head from those sown in July last, which, if grown in shelter and under garden cultivation, would be very large just now. *W. G. H.*

—It is, indeed, difficult to understand two things relating to Cabbages in Scotland, written of by "W. S." First, in relation to the bolting off to flower of the plants generally; and second, as to the greater hardiness of Scotch stocks over those of the south. "W. S." attributes the general bolting off to bloom of the Scotch Cabbages to the severity of the winter. Here, in Middlesex, the winter was intensely severe also, added to which we had to endure for many days the horrors of metropolitan fogs. The weather killed almost everything of the Brassica tribe except the autumn-planted Cabbages. They stood so well that few were killed, and none have bolted off to flower. It is obvious that the hard weather here had nothing to do with the Cabbages, because they have not appreciably suffered. The chief fault found with them now is that they are so robust they do not early heart in. That is, however, the fault of the strains or stocks grown, and may be remedied another year if growers will but sow the proper varieties. But when "W. S." claims for the Scotch stocks that they are harder than are those of southern growth, he should have either shown that the breadths which have thus unduly bolted in the north were of southern stocks, and not of northern stocks, or else that our southern Cabbages had succumbed to the severe winter weather. It may be that the northern stocks were sown too early last year. Some people are in such a hurry to beat their neighbours, that they do but over-reach themselves, and it would seem as if the canny Scot, who, by sowing ten or fourteen days earlier, hoped to excel his neighbour in the market, had for once been bitten, and found failure where he looked for gain. Now, here in Middlesex, when we see a Cabbage breadth unduly bolting off to flower, becoming, in fact, a biennial when the plants should be triennial, we usually hold that the stock is in fault, and that the seed was saved under similar growth. It would be almost a crime to save and sell seed so produced, as it is morally certain the defect of character thus formed will be perpetuated. Ordina-

arily, good stocks never bolt, even let the weather be ever so hard, and if ever hard weather might have been held as an excuse for undue blooming, it certainly was the weather of last winter. I could wish that our metropolitan Cabbage growers would grow fewer of the old large-leaved stocks, and more of the smaller-leaved earlier-heading varieties. These market growers are very chary of taking up new or less known sorts, because they grow large breadths, and the risk is great. In that respect they are behind private gardeners, who, in their small way, usually try all new varieties, and thus get to understand what merits each one possess. If, instead of sending into market in enormous quantities the large-leaved, late-heading varieties, growers had breadths of Ellam's Early, Heartwell, Etampes, or similar varieties, they would be great gainers, and so would the public. In spite of the fact that Cabbages have been plentiful, we have found really early small, solid-hearted ones, rare. As a rule, on the hard and none too deeply-worked ground of the market fields, Cabbages would turn in earlier than in deeply-trenched soil, and be harder. That they are not so early is chiefly owing to bad sorts. It does seem an absurdity that large numbers of women should be employed in the fields tying Cabbages, just as though they were Lettuces, and not to induce them to heart, because they will heart in none the sooner for the tying, but to mislead purchasers into the belief that the heads are really solid and well blanched. Had the growers really firm-heading, precocious sorts, that kind of deception need not be practised. *A. D.*

EARLY PEAS.—These have been very much damaged, as your correspondent, "R. D.," points out at p. 758, vol. ix., of the *Gardeners' Chronicle*. We commenced to gather Peas from plants which began to flower at the end of the month of April, but which were much retarded by the frosts. These were raised in a cold house, and then planted out on a warm border; had sticks put to them, and were protected with small branches of Spruce Fir; but, in spite of all these precautions, Chelsea Gem Pea, sown outside in the first week in February, was ready at the same time; and it is at least a week before any other variety that I grow. American Wonder, Veitch's Selected, William 1st, were sown at the same time. Chelsea Gem is harder than other early Peas, and the pods are large and filled with well-flavoured seeds. Another season I shall trust to this variety entirely for early work. The kitchen-garden foreman says that it is the best early Pea he has seen for filling the basket. Another good variety is Cannell's "English Wonder," a Pea sent to me for trial, which is a very strong grower, very dwarf and prolific; in fact, I think it would be nearly as early as Chelsea Gem if it were sown at the same date. It is a plant that forces well, as was apparent in a small batch in pots, which was grown side by side with Chelsea Gem. American Wonder was more cut by frost this season than any other Pea that I grow, so it would seem to be a somewhat tender plant. Neither Chelsea Gem, American Wonder, or English Wonder requires any support, all of them growing from 15 to 18 inches in height. *W. A. Cook, Compton Bassett.*

DORONICUMS ON THE GRASS.—After growing the *Doronicum* in different soils and situations, the best position is, I find, in a damp situation on turf. In such a situation we have a large clump at the present time which is a mass of flower. On taking charge of these gardens two years ago, I found a strong clump of this species of *Doronicum* growing on a dry situation, and I resolved to divide it, and plant it as an experiment on the lawn. The plants were taken up in February of last year, divided and planted 1 foot apart, first making a station for them by removing the clayey soil and replacing it with ordinary garden soil. That year they grew so well that twelve months from the planting, each alternate plant could be removed with advantage to those which were left, and these were used to double the size of the clump, and at the present time the plants touch each other. The position being on sloping ground and backed with clumps of *Rhododendrons*, the group when seen from a short distance has a beautiful effect. The *Doronicums*, beside their value as hardy plants for massing and for borders, are useful for cutting, they being furnished with long flower-stems, and keeping a long time fresh in water. There are in these gardens large masses of other plants, viz., *Funkias*, *Trollius europaeus*, *Polygonums*, *Herbaceous Peonies*, large masses of *Saxifraga granulata flore-pleno*; one of these under a Lime tree is many yards across, and in its season it is one sheet

of white flowers. Coloured *Primroses* also make a grand feature on the turf, and are placed in separate colours of such strains as Dean's and Waterer's. *Pro, Forde Abbey.*

LILIUM LONGIFLORUM VAR. HARRISI, AND GREENFLY.—Mr. Pearson well deserves the thanks of amateurs and gardeners for letting them know of so quick and effectual a remedy as that he mentions for greenfly on *Lilium Harrisii* and other plants, as it is not only cheap and simple but easy of application; and, if no injury results, what a boon it will be. In a general way, I fight rather shy of insecticides, as assistants are not half particular enough in weighing or measuring quantities, and putting the right proportions, and the haphazard system is responsible for much mischief being done among plants. If tobacco juice could only be had at a cheap or reasonable rate, or the weed the same, for horticultural use, then aphid would not be such a terror or plague to gardeners, as they would be able to despatch them instanter with safety! Perhaps some day we may have McDougall's sheets at half the price at which they are sold now, or some other preparation as good. *J. Sheppard.*

LEONTOPIDIUM ALPINUM: "LION'S FOOT," OR "EDELWEISS."—This plant is now opening its pale yellow flowers, of which there are many in a head, surrounded by a star-like whorl of woolly oblong leaves; by some thought to be more curious than beautiful. Its native place is on the high mountain pastures of Switzerland, &c. It should be planted in an exposed place in the rockery, in moist porous soil, as it likes moisture, but not an excess of it. It can be multiplied by careful division. Some people find great difficulty in growing this little alpine successfully, but I do not know why, unless it be for want of water during very dry weather. *H. Grillage.*

SALVIA HIAS.—The stiff and cold soil of the garden at Edge is unfavourable for most *Salvias*, but *Salvia hias* is a notable exception, and I can recommend it as a very hardy and very ornamental plant, having in addition the merit of being contented, for at least ten years, with the spot in which it is planted, and flowering more strongly every year. The flower-stalks are about 2 feet high, producing many whorls of large purple flowers with a white mark inside. The growth is compact, and several stalks are produced from a small base; seed is ripened annually in small quantity, and the seedlings begin to flower when two years old. The habit is strictly herbaceous. *C. Wolley Dod, Edge Hall, Malpas.*

THE SEED TRADE.

SOWING PEAS.—The old practice of sowing Peas in the open during the month of November, at one time carried out in many gardens, and especially in those of the Southern Counties, in the belief that a considerable gain in earliness of crop resulted in spring, is one now largely abandoned. It is found that a great amount of labour is entailed, with considerable risks of losing the crop, and that the difference in gathering was very slight. Then the introduction of such dwarf varieties as Little Gem, American Wonder, William Hurst, and Chelsea Gem, has placed gardeners in possession of varieties they can grow in pots, or which they can sow in boxes early in the year under glass, and transfer to the open ground in early spring when the weather is favourable. The hardier types of early Peas, represented by the blue and white round varieties, may be sown as early as possible in March, and it will be found they will come in almost or quite as early as those sown in the open in November, and which had to be very carefully attended to during the winter. For this purpose Sutton's Ringleader, their Early Blue, which seems to be identical with Harrison's Eclipse; and Improved William the First—as representing the hardier types of early round Peas, are decidedly the best for early sowings in the open. But with these it is a question of stock. I have seen Ringleader, dwarf, compact, vigorous, and bearing freely good pods. I have seen it tall, loose in growth, lanky in appearance, late, and producing quite small and unprofitable pods. So much can be done in the way of selecting good stocks of Peas; and he who enters upon this work and achieves success is as great a

benefactor to the gardening community as he who raises an acceptable new variety.

Some interesting particulars are constantly being revealed to those who have to do largely with the sowing and testing the qualities of Peas. I saw at the end of May, in Essex, a large trial of Peas of many sorts sown very carefully in rows to test their quality; and while the round varieties, whether early or main crop, had germinated well, and with average regularity, the early wrinkled varieties had done badly. And yet it was not for lack of adequate germinating power; for samples of the same, the growth of which had been tested in heat, and again by a later sowing in April, had germinated freely. The condition of the soil in early spring does not appear to be so favourable to the quick growth of wrinkled as of round Peas. Then 1890 was unfavourable to the proper harvesting of many Peas, and especially to the wrinkled varieties, which always suffer most in a wet season. The conclusion came to was, that on the whole it is well not to sow wrinkled Peas so early in the season as the round ones.

A wholesale seed house in a large way of business receives every year a good number of stocks of the same variety of Pea grown in various parts. It is the custom to take a half pint sample from each delivery, carefully marking upon it the name of the variety and grower, and the quantity delivered, and then sow in March, keeping about one-third of the seed. The early sowing is in order to test both quality and growth. A second sowing is made early in May, simply as a further test of growth, and a third sowing is sometimes made at the end of May, the seeds being then taken from the bulk. All this work entails considerable labour; but it is very necessary in working a large business.

As showing the lateness of the season, Early Peas which, when sown in the middle of March, generally bloom about May 24, showed no sign of flower at the end of May; indeed it could hardly be said the flower-buds were there, and the irregularities of germination in such a season were remarkable. For instance, seed of William Hurst Pea, growing against sticks in their trial grounds at Chelmsford, the sample good, grew very sparingly, though more than usual care had been taken in saving it; but seed of the same variety, saved in Kent, Sussex, and Lincolnshire, grew well. A sample of the same, sown at the beginning of May, had germinated well, so it would appear obvious that conditions of soil must have affected the growth of the seed. And yet it was naturally thought that if the growth of my sample would be satisfactory, it would be that saved under such favourable conditions. A very large quantity of samples are sown—sometimes as many as fifteen to twenty of one sort. All have sticks placed against them for their support, and they are carefully examined and their peculiarities noted. The produce of any particularly fine and true sample is carefully saved, and grown another season for stock seeds.

It is noticed that, as a rule, small, indented, and wrinkled seed grow thickly; but in the case of large seeds, they germinate less satisfactorily. Indeed, it appears to hold good generally, that the larger the Peas the greater is the number of failures. *Pisum*.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM LEROYANUM ×.

A HYBRID raised at Armainvillers between *O. crispum* and *O. luteo-purpureum*. *O. Wilckeanum* is supposed to be a natural hybrid between the same parents, but whether or no, the present plant figured in the April number of the *Orchidophile* is distinct from *Wilckeanum*. The flowers are stellate, with oblong lanceolate undulate white segments, barred with chocolate spots, and with the callus of the lip yellow and fringed, as in triumphans.

ORCHIDS AT BURFORD LODGE.

In the famous collection of Sir Trevor Lawrence, Bart., M.P., there is an unusually large display of all the showy genera—*Odontoglossum*, *Cattleya*, *Lælia*, *Dendrobium*, &c.—of which an excellent idea was afforded by the large group of rare species shown by him at the last Temple Show. All the plants shown there are now out of bloom, but the number of good things in flower is even greater than at that time.

In one of those compact, warm houses, in which most things thrive well, were numbers of fine *Vandateres* in bloom, not a single growth having missed flowering; also a specimen of *V. t. alba*, a delicately-tinted form, but not entirely white, as the name might lead one to suppose. Here, too, in a shady corner, was a fine stock of the beautiful vermilion terrestrial Orchid, *Habenaria militaris*, all the plants being stout, and with fine, perfect, and beautifully marbled stout foliage. Few growers of this plant succeed with it, and if we note that it is grown beside vigorous and flourishing plants of *Miltonia Ræzii*, it may give the unsuccessful a clue to the proper method of culture. In the same house were plants of *Epidendrum radicans*, with fine heads of dark scarlet flowers; some also of *Phaius Humboldtii*, and a very beautiful hybrid *Cypripedium* × (*Lowii* × *superbiens*).

THE DENDROBES.

We noted amongst these the singular *D. stratiotes*, with its long erect twisted petals, the curious and allied *D. strebloceros* and its white variety *D. S. Rossianum*. Other *Dendrobes* in bloom were *D. suavisimum*, *D. Phalenopsis*, *D. triadenum*, *D. aduncum*, &c. The bank consisting of *Cypripediums*, which always look so fresh and healthy, and which are never without some one or other in flower, have *C. bellatulum*, *C. niveum*, *C. Godefroyæ*, and *C. concolor*, all well furnished with bloom, as well as fine specimens of the favourite *C. Lawrenceanum*, *C. superbiens*, *C. Curtisii*, *C. superciliare* ×, *C. Sedeni candidulum* ×, *C. orphanum* ×, *C. Ashburtoniæ expansum* ×, and others; and in the same house *Catasetum Bunge-rothii*, *Phalenopsis Sanderiana*, and *P. sumatrana*. Suspended in this house, too, was a very rare and curious collection of *Cirrhopetalum* and *Bulbophyllum*, whose quaint flowers always attract so much attention whenever they are exhibited in public.

In the *Acrides*-house a beautiful specimen of *Acrides nobile* had seven spikes; and *A. crassifolium*, *A. falcatum*, *A. multiflorum*, and *A. odoratum* are in bloom; and in the adjoining house were some noble specimens of *Sobralia macrantha*, a plant of the white *S. virginialis*, and various pretty and interesting *Epidendrums*.

The *Cattleya* and *Lælia*-houses have their occupants, like all the others in the Burford collection, in fine health; in bloom being some good examples of *Cattleya Warszewiczii* (gigas), *C. Mendeli*, *C. Mossiæ*, &c. Here the forms of *Lælia elegans* are grown to great perfection. In these houses were some grand specimens beside the *Cattleyas*, notably a great mass of *Celogyne Lowii*, with seventeen leading growths, and the good and healthy collection of *Vandas*, and fine pans of the various species of *Pleione*.

In an adjoining stove, among well-flowered specimens of *Begonias*, *Tydas*, &c., including the curious chocolate-coloured *Tinnea æthiopica*, which has a delightful odour of Violets, are two huge specimens, one perhaps the largest known of *Grammatophyllum speciosum*; and the *Renanthera coccinea*, which has been in the Burford collection for many years, and whose history can be traced back to a very early date in the history of Orchid cultivation in this country, and which goes far to prove that many species of Orchids do neither degenerate or die, if they are carefully tended.

The Cool-houses afforded a rare show of bloom—those devoted to the *Odontoglossums* having a fine display of *O. crispum*, of which the most striking are the *O. c. Burford* variety, with finely-formed and heavily-spotted flowers; and *O. c. Purple Emperor*, a charming variety with rosy-purple flowers, on

which are a few brownish spots. There were also some curious hybrid *Odontoglossums* in bloom, and some fine forms of *O. luteo-purpureum*, the pretty white and purple *O. Lucienianum*, and a good batch of *Epidendrum vitellinum*.

In the *Masdevallia*-house in which the forms of *O. crispum*, *O. Forbesii*, *O. curtum*, &c., thrive well, was a brilliant display of the showier *Masdevallias*, whose countless flowers of dazzling brilliance mingle effectively their shades of scarlet, orange, mauve, and purple, and with the more stately varieties of *M. Harryana*, *M. Veitchiana*, *M. ignea*, &c., the dwarfier *M. rosea* and other species are very attractive. Two very fine hybrid *Masdevallias* were in bloom, viz., the very rich orange *M. Mundynna* ×, and the pretty *M. Geleniana* ×; and among the miniature species, *M. tridactylites*, *M. Wageneri*, *M. swertiaefolia*, and the pretty *M. irrorata*,

CURIOUS AND RARE ORCHIDS

are noted in the Burford collection, and, as Mr. W. White, the Orchid grower says, the smallest-flowered species, which some Orchid growers pretend to despise, always command a great amount of attention from visitors when they are flowered well. Among this class of plants now in bloom were noted the beautiful *Masdevallia picturata*, with its yellowish flowers, spotted with chocolate-crimson, and which we believe was flowering for the first time in cultivation. *Pleurothallis macroblepharis*, too, with its slender sprays of midge-like flowers, and the singular and beautiful *P. ornata*, with its velvety-black flowers fringed with silver, should be noted; also *Luisia volucris*, with its dark purple labellum, dorsal sepal, and horny-like petals, each over an inch in length, and the red and white *Oncidium triquetrum*. *Sarcopodium psittacoglossum*, too, is a very singular and pretty species, and *Bulbophyllum elegans*, a quaint flower. Of a showier class we mention the noble specimen of the Swan-Orchid (*Cycnoches chlorochilon*), with two fine spikes of six flowers each—probably the greatest number a plant has even borne under cultivation. Of *Disa racemosa* there are good specimens, well-furnished with light rosy-crimson flowers; the old but rare *Warrea cyanea*, too, had a fine spike of flowers, with their attractive dark blue labellums; *Hexisia bidentata* was profusely furnished with scarlet blooms; the rare *Celogyne Dayana*, of the original importation, was in flower, and in the various houses were found many other pretty and rare species which are seldom observed in other collections. The gardens around the Orchid houses are filled with *Roses*, herbaceous perennials and annuals, very bright and attractive, and far more satisfactory than would be the case if planted with what are commonly called bedding plants.

A FINE PHALANOPSIS GRANDIFLORA.

In the gardens of F. Wigan, Esq., at Clare Lawn, East Sheen, is a very fine specimen of *Phalenopsis grandiflora*, the largest of the seven leaves has being 14 inches long and 3 inches wide. During the winter the plant made three leaves, and finished up by producing a flower-spike from the apex of the plant instead of from the base of a leaf. Its flowers were unusually large, as the following figures will indicate: diameter, $4\frac{1}{2}$ inches; width of petal, $2\frac{1}{2}$ inches; width of top sepal $1\frac{1}{2}$ inch; length of flower-spike (which has a branch), 2 feet 6 inches. The main spike has twelve flowers, and the lateral six flowers.

FLORISTS' FLOWERS.

CARNATIONS.

UNFORTUNATELY, growers of collections are still finding their plants die, and to their sorrow, after they have set forth upon a period of promising growth. Those who examined the plants found dead or dying in the spring, after they had endured the perils of the winter, discovered that the point where decay set in was just at the surface of the soil; the stem was found to have decayed through—rotten, it might be termed, though with a dry rather than

with a wet rot. I have seen collections in which plants are dying from the same cause—happily not many, but some—and an examination seems to show that decay set in upon the outer bark, and worked its way through to the centre of the stem. It is not an insect like the wire-worm at work, but it seems to partake more of the character of a decay wrought by some cause, probably the action of frost and wet combined. Possibly the fact that layers were somewhat succulent when the November frost of last year overtook them, operated to render them more liable to attack. So far, plants in pots have been free from insect pests, but with the advent of hot sunny weather, they are putting in appearance. Aphis can be kept under by brushing them into space by means of a camel's-hair brush; if through oversight they have become numerous, an insecticide should be employed.

Calling upon Mr. Joseph Lakin, of Temple Cowley, a few days ago, I found him very busy going through his Carnations, cleansing them of all dead foliage, stirring the soil, and topdressing with a compost made up of yellow loam, cow manure, and a little lime; tying up the main shoots, and then laying oyster shells upon the surface to prevent evaporation. It takes some time to go through several hundreds of pots, but it is a process decidedly advantageous to the plants. Mr. Lakin blooms his plants in smaller pots than is usual, a pair of plants, generally, occupying one pot; but they are healthy, and full of promise, though late. But much will depend upon the weather during the next month.

In the open ground, Mr. Lakin has beds of his new white Self Carnations, Annie Lakin and Emma Lakin, the plants having been put out in October last. The constitutional vigour of both of these varieties is seen in the way in which they came through the winter; there is scarcely a blank in the lines of vigorous plants, and in a month or so they will present to view sheets of bloom. The new white Pink, Mrs. Lakin, distributed this season, is also a vigorous grower, and remarkably free of bloom. Apart from the high quality and purity of its blossoms, it has the desirable characteristic of not splitting its calyx. *R. D.*

THE AURICULA.

Growers are always busy amongst their plants, and where the collection is of moderate size, something will require to be done every day beyond watering the plants and removing the lights. Seedlings must be grown on freely if they are to flower next year, repotting them until they reach the size in which they will flower—60's, or a size larger. I know the advantage of planting out seedlings in the open; it saves labour, and the plants grow rapidly to a flowering size. It is, of course, necessary to lift them in their flowering-pots, at the latest before the third week in September. Seedling alpine Auriculas, which do so well out-of-doors in our climate, must not be much shaded, as they do not need shade to the same extent as the Auricula proper. In hot weather, the common green aphis, as well as the Auricula aphis, multiply exceedingly, and a continual warfare must be waged against them by dusting with tobacco-powder, or fumigating with tobacco, which are the two most effectual means of destroying them. The repotting of Auriculas should be finished quickly, in order that the plants may be established before the cold weather. Do not let the plants suffer for want of water, but also do not afford them too much.

THE CARNATION AND PICOTEE.

The weather was so cold to nearly the middle of June, that it seemed as if it must be a very late season, but the month was really warm in its latter half, and the progress of the flower-buds has been very rapid. A rather remarkable phenomenon occurs annually with my plants in pots; before the petals have grown enough to open the calyx, many of the flowers are found quite disfigured by thrips. How these insects get into the buds before they open is a mystery to me, especially as there are scores of plants in the open ground quite close to them, and none of these are attacked by thrips. It

has been found advisable to get the plants under glass as soon as we can, and fumigate them with tobacco. The seedling plants which are to flower out-of-doors have made unusually good growth, and are crowded with flower-buds. I did not at one time expect that they would be in flower before August, but the hot weather is speedily bringing them forward. The flower supports are being now put to the plants, and when this is done, the ground will be prepared, and the seedlings raised from seeds sown in April last will be planted out. These last are very strong—just such plants as are sure to have plenty of blooms next year. We plant them 12 or 15 inches apart, and as the soil is deep and well manured, they speedily touch each other.

PINKS.

All classes of these are flowering well this year but for beautiful useful border flowers, the pure white varieties with fringed petals are preferable to any others. No one can deny the exceeding beauty of the laced Pinks; the sparkling white ground, enriched with a line of scarlet or reddish-purple round each petal, and a narrow white margin; but they are still not so effective as the best selfs for bouquets and the other purposes for which Pinks are used. Now is the right time to put in pipings; these should consist of the growths found at the base of the plants, be cut clean through just below a joint, and planted under hand-lights or *cloches*, which should be kept close until roots form; when rooted, the pipings should be aired for a few days, and then planted out 3 or 4 inches apart in beds of light soil, to gain strength, and finally planted about 10 inches asunder where they are to flower, before the end of the month of September. I like to get mine established early, late-planted Pinks suffering more from frost. All those plants intended to be forced in pots should be planted out in rich porous soil, at 12 inches from plant to plant, lifting in September, and potting them in 48's or 32's.

PANSIES.

have made a grand show this year generally, where the planting was done in deep rich ground. We have a bed of them, 5 feet in width and 90 feet in length, in which the plants as they grew were pegged down, and the earth is completely hidden. It is yet too soon to take cuttings, the end of July being soon enough for the first lot, and a month later for the second. Sometimes those taken early do the better, and sometimes the later ones. This depends a good deal upon the weather; for if it be hot after the cuttings are put in, an aphis of a reddish colour cripples them. There is no need to put in these cuttings, or rather slips, under glass; they do better in an open border, where the sun will not shine upon them from 10 A.M. till 4 P.M. The Pansy even more than the Pink or the Carnation, delights in an open rich soil. *J. Douglas.*

COLONIAL NOTES.

CANADA.

ROYAL SOCIETY OF CANADA.—The annual meeting of the Royal Society of Canada was held this year in the city of Montreal (by invitation of the citizens) during the last week of May. In Section IV., a paper was read by Professor Penhallow on the "Pleistocene Plants of Canada, with two new species from the United States. Sir William Dawson and Professor Penhallow read a paper on "Parksa decipiens," a fossil found in the shady Lower Devonian rocks of Perthshire and Forfarshire, and which was likened by the late Professor Fleming, of Edinburgh, to a Sparganium, while others regarded it as molluscan spawn. The microscopical characters seem to show it to be a Rhizocarp allied to Pilularia. An unmistakable drawing of a Prothallus was shown.

Professor Lawson read a paper "On the Present State of Botany in the Dominion of Canada, with Suggestions as to promising lines of investigation, and a Proposal for united Effort in Systematic

Observation throughout the several Provinces and Territories." This paper was fully discussed by Professor Penhallow, Professor Saunders, Professor Macoun, Sir William Dawson, Mr. Matthews, Mr. Hay, and others, and, in accordance with its leading suggestion, the Botanical Members of the Section resolved to form an organization for the systematic exploration of the several Provinces and Territories of the Dominion, such organization to be known as the Botanical Club of Canada.

The Club is formed altogether distinct from the Royal Society of Canada, but affiliated with it in the same manner as the other scientific and literary societies of the Dominion. The club is started without any restraining constitution or bye-laws, but with a corps of officers which can be increased by appointment, and who are at liberty to advance the work in whatever fashion each may find most effective. The general organization for this year is as follows:—President: Professor Lawson, Halifax, Nova Scotia. Secretary - Treasurer: Principal MacKay, Halifax.

Secretaries for provinces:—Ontario—Professor John Macoun, Botanist of the Geological Survey of Canada, Ottawa. Quebec—Professor D. P. Penhallow, Montreal. New Brunswick—G. U. Hay, St. John. Nova Scotia—E. J. Lay, Esq., Amherst. P. E. I.—F. Bain, Esq., Charlottetown. Newfoundland—Rev. A. C. Waghorne, St. Johns. Manitoba—Mr. Burman, Winnipeg. Alberta—W. H. Galbraith, Lethbridge. British Columbia—Dr. Newcombe, Victoria. The list of provincial and local secretaries is being largely extended.

The secretaries for the provinces are expected to stimulate in any manner they may devise, the botanical exploration of every section of their territory, by stirring up local botanists; by setting collectors at work in every possible locality, and thus develop new botanists; by having published in the local papers the lists of all plants in each section of the country as the work of exploration goes on; by collecting and critically examining and correcting such lists; by forming field clubs; and by transmitting suggestions and a summary of the work done in the provinces to the central officers before the end of 1891.

The work of the Club will be reported annually to the Royal Society of Canada; and papers prepared by its members, of a sufficiently complete character for permanent record, will be submitted for publication in the Society's *Transactions*.

SOCIETIES.

MIDLAND COUNTIES PANSY.

The first exhibition of this Society took place in Birmingham on Wednesday, June 24. The leading prize-winners in the "open to all" classes were Mr. John Smellie, Bushy, Glasgow; Mr. A. Bailey, jun., Sunderland; Mr. Campbell, Blantyre; Mr. A. Irvine, Tigh-na-bruaich, near Rothesay; and Mr. A. Lister, Rothesay. Some very fine blooms were exhibited by them, and Mr. Irvine had, amongst new ones, fine blooms of John Morris, John Cook, Mrs. A. Irvine, Nellie Cooke, Minnie Tate, Lizzie Irvine, W. H. Gabb, and Lizzie Forest, not yet sent out.

In the class for local growers, Messrs. Pope & Sons, King's Norton Nurseries, were 1st respectively for twenty-four Fancies and twelve new Fancies, and the other classes were well filled.

Messrs. Dobbie & Co., florists, Rothesay, sent a large collection of Violas, which included the leading varieties, and two new ones—Lass o' Gowrie and Annie King, which received certificates. In this collection, some of the most striking were Duchess of Fife, Countess of Elgin, Lucy Ashton, Mrs. Bellamy, Bullion, Evelyn, Gipsy Queen, Mrs. Grant, Ada Adair, The Mearns, Minnie Baxter, and Goldfinch. The same firm also contributed a very large display of fancy Pansies.

Some of the finest of the more recently-introduced fancy Pansies exhibited were—Miss Duncan, very fine generally; George Anderson, grand everywhere; Lord Hamilton, Donald Morrison, Tom Travis, a

superb variety; Teenie Mitchell, Helen Christie, Maggie A. Scott, Mrs. Hugh Weir, William Caldwell, William Ross, F. R. McDonald, Mrs. J. McConnell, James Simkins, John Taylor, Agnes Mabel, Mrs. Freeland, David Rennie, and Mrs. M. T. Atkinson.

Mr. James Simkins, King's Norton, won the *Gardeners' Magazine* Silver Medal and a Certificate for fancy Pansy Baccarat, in the amateur's class; and Messrs. Hewitt & Co., Solihull, obtained a Certificate for a beautiful coloured bedding fancy Viola, named Peacock.

RICHMOND HORTICULTURAL.

BEYOND a passing thunderstorm, there was little in the weather to interfere with this popular Society's exhibition, held as usual in that fine expanse, the Old Deer Park. Had some of the enterprising show managers from the North or West, charge of the Richmond show, they would make the gathering into a brilliant horticultural gala, and bring together tens of thousands of people. At present the gathering is a show with very good instrumental music, and does not attract one-tithe of the people who might be looked for to attend. On the recent occasion, the attendance of the Duke and Duchess of Teck, with the Princess Victoria, materially helped to draw, as perhaps also did the fine band of the Grenadier Guards, and the huge band of 120 instrumentalists from the Military School of Music, Kenella Hall, Twickenham. Still the gate-money was not at all excessive. The plants were chiefly found in a large tent, which it needs very many and fine collections to effectively fill. Palms and Ferns were too apparent, forming a miniature forest of greenery, almost unrelieved by colour, the flowering plants being staged at one end, and the foliage plants at the other, a most unfortunate arrangement.

Messrs. J. Laing & Sons, Forest Hill, had one side a capital group of foliage and flowering plants, including numerous good Begonias. Messrs. W. Cutbush & Sons, Highgate, had a pretty group of Heaths, Statice, Spiræas, and several of the bottle-brush plant, *Metrosideros floribunda*. Mr. Icton, of Putney, had a fine group of Palms, interspersed with variegated Euryas, Acers, Dracenas, &c. Mr. Mould, Pewsey, a good group of semi-specimen Heaths, the best of which were *Erica Cavendishii*, *ventricosa rosea*, and *exquisita*, with other plants. Mr. J. Chambers had a collection of his snowflake *Viola*, *Phlox uniflora*, white, with red eye, various wreaths, crosses, bouquets, &c. Several groups formerly so attractive were this year conspicuously absent.

Decorative Groups.—The best of these in the larger class was arranged by Mr. W. Brown, of Richmond, whose style is so well known and rarely excelled. Mr. Fordham, of Twickenham, and Mr. W. James, Lower Norwood, came 2nd and 3rd. Some smaller groups came from local gardeners, and were of the customary pattern of which visitors are beginning to tire. The chief stove and greenhouse plants in flower came from Wiltshire. Mr. Mould having the best in three good *Ericas*, *Cavendishiana*, *ventricosa*, *Bothwelliana*, and *Aristella*; a huge and finely flowered *Dracophyllum gracile*, *Statice floribunda*, and *Bougainvillea glabra*, the latter two rather weak. Mr. Currey, gr. to Colonel Pepper, Salisbury, was 2nd, having some fair *Ericas*, &c.

Foliage plants, though so numerous, call for no special comment, as they attract little attention.

Orchids were, in the competitive class, more numerous than usual. The best six came from Mr. Young, gr. to F. Wigan, Esq., Sheen. The fine white *Phalenopsis grandiflora* was exceptionally striking; *Cattleya Mendeli* and *Miltonia vexillaria* were excellent. Mr. Ryder, gr. to C. Young, Esq., Richmond, was 2nd, having some good *Cattleyas Mendeli* and *Mossiae*. In other collections, *Epidendrum vitellinum majus*, *Oncidium macranthum*, and *Odontoglossum Alexandrae*, were also excellent.

Begonias.—Mr. H. Little, Twickenham, had the best twelve, very showy, well-bloomed plants; most of the others were too small-flowered, and drooping, thus failing to give any good effect.

Gloxinias formed a telling feature. The finest nine, in one class, some really splendid plants, were from Mr. T. B. Hilditch, Richmond; and in another class, the best were from Mr. P. Hanken, Sheen. Owing to the omission of the names of the gardeners from the cards, we are unable to furnish them. Gardeners should see to that at any future show.

Pelargoniums, both show and fancy, from Mr. C. Turner, of Slough, were as usual good, the best of the former were Goldmine, Sister of Mercy, Statesman,

and Duke of Norfolk; and of the latter the Shah, Fanny Gair, Princess Teck, and Ambassadors. Mr. Baldwin, of Hillingdon, had some very good plants also. Mr. Turner, Mr. Baldwin, and Mr. Clay, of Kingston, had fine groups of the above varieties in great profusion. Mr. H. Little had some splendidly-flowered zonal *Pelargoniums*—J. Veitch, Mrs. Johnson, Mrs. Gordon, Italica, and Pearson's Pink, were wonderfully fine. He also had the best six ivy-leaved plants, all good doubles.

Fuchsias were moderate in quality, a long way below the earlier Richmond form. Some prettily dressed baskets of plants came from Mr. Little and Mr. Furse, Teddington; and Mr. Cookey, of Kingston, had a pretty basket of *Odontoglossum Alexandrae*.

Cut Flowers.—Roses usually form a strong feature, but this year all the well-known trade exhibitors of former years and their flowers were conspicuously absent. The best thirty-six trebles came, curiously enough, from Yorkshire, Mr. May, of Bedale, being placed 1st, with what was presumably a meritorious lot of flowers for the season. Messrs. Prior & Sons, Colchester, were 1st, with twenty-four trebles. The former exhibitor had the best twelve Teas, and the latter the best twelve yellows in good *Maréchal Niel*. In the amateur's class, an invincible local grower, Mr. Warwick, gr. to J. T. Kitchen, Esq., Hampton, was 1st, with twenty-four capital blooms; and in a second class, Mr. H. E. West, Reigate, was 1st. Messrs. Jackman & Sons, Woking, showed several boxes of fairly good flowers.

Baskets and bouquets of Roses were fresh and pleasing early in the day, but later drooped materially. Miss Clarke, Whitton, and Miss Heston, the Orphanage, Twickenham, had the best baskets. Bouquets were of a somewhat lumpy order. Very admirable ordinary bouquets came from Mr. Perkins, Coventry, and Mr. Butcher, Clapham, and were largely composed of Orchids.

Table-stands always form a very attractive feature here, and some of the styles of setting up are quaint and not always pleasing; as a rule, the ladies who do these things overload their arrangements. In the class for three stands, Mr. Butcher who was 1st, departed from the stereotyped glass-stand, and built up three small mounds of moss on trays, one round, two about 16 inches long; these mounds were dressed with tiny Palms, *Caladiums*, Ferns, &c., and a few fitting flowers, and were very pretty, they had the merit of presenting no obstruction to sight and conversation across the table. Miss Cole, of Feltham, was 2nd, with rather low stands, dressed chiefly with pink and white Carnations. In the class for two stands, Miss Mould, of Richmond, was 1st, being dressed with Iceland Poppies, whilst Miss Wigan had her stand filled with blue and white Irises.

Fruit was moderately good. Mr. C. J. Waite, Glenhurst, Esher, was 1st, with six dishes; Mr. Osman, Ottershaw, being 2nd. The latter had the best three bunches of Black Hamburg Grapes; and Mr. Ford, gr. to W. H. Ellis, Esq., Hounslow, the best white, in good Foster's Seedling. Alexander and Dymond Peaches were very fine, and Lord Napier Nectarines wonderfully good. Noble was the chief Strawberry, Mr. Waite having the best.

Vegetables.—As usual, Mr. Waite was an easy 1st in several classes, taking the premier awards in one class for twelve, another for nine, and a third for six dishes, in all twenty-seven dishes, all first-rate. For the season his Early Forcing Cauliflowers, Perfection Tomatoes, Duke of Albany and Duchess of Albany Peas, International Potatoes, Giant White Lettuces, Asparagus, &c. were of the highest merit. Mr. Waite also had the best dish of Tomatoes in the class—a very fine sample. Mr. E. H. Page, Ham House Gardens, Petersham, was 1st in a second class for twelve vegetables, a very good lot indeed. Generally all other vegetables were much behind the usual Richmond standard, the show being rather too early, and the season much too late. Cucumbers were of the old style, rather too large and irregular.

TORQUAY ROSE SHOW.

THE Annual Rose Show was held as usual at the Down Nursery, on June 24 and 25, the flowers being tabled in a show-house 150×25 feet. Valuable prizes were offered both by the Torquay Horticultural Society and by Messrs. Curtis, Sandford & Co. The competition, it was obvious, becomes greater each year. Owing to rain falling heavily the whole of the previous day, the Rose-blooms, especially hybrid perpetuals, were much damaged. Still some

very creditable stands were staged. Visitors were admitted without payment, but they were requested to give something on behalf of the local Gardeners' Relief Fund. About £56 was collected in this way during the two days of the exhibition. A large number of the gardeners of the neighbourhood form the committee, which is presided over by Dr. Ramsey, with Captain W. Fane Tucker as Hon. Treasurer; and Mr. A. Chandler (of the firm of Curtis, Sandford & Co.), as Hon. Secretary. This committee meet monthly, and relieve any cases of distress amongst gardeners or the widows of gardeners, provide immediate relief, which in many cases is most welcome. The Society does much real good in this way, and the names of many eminent horticulturists in the neighbourhood and in the county, who belong to it, form a sufficient guarantee that it is a *bona fide* institution, whose endeavours to relieve deserving cases are appreciated generally, as was shown by the contents of the collection boxes there.

Messrs. Curtis, Sandford & Co. exhibited a large collection of cut Roses, Pæonies, &c. of great excellence. Messrs. Veitch & Son, of Exeter, had a very attractive stand of herbaceous Pæonies, Irises, single and double Pyrethrum, Delphinium, Pansies, Orchids, &c. Mr. Coombes, fruiterer, staged a large variety of fruits of Cherries, Grapes, black and white; Lemons, Strawberries, Melons, Pine-apples, Tasmanian Apples, Tomatos, Oranges, &c.

Division A, in which prizes are offered by the horticultural societies of Torquay.

Thirty-six Roses, distinct, one truss of each.—1st, Mr. J. French, gr. to Moreton Sparks, Esq., Rooklands, Torquay; 2nd, Mr. J. Sloman, gr. to Captain W. Fane Tucker, Braddon Tor, Torquay.

Twelve distinct, three trusses of each.—2nd, Mr. J. French; 3rd, Mr. J. Sloman.

Twenty-four distinct, one truss of each.—1st, Mr. Hasler, gr. to Mrs. Keade, Brailsford, Torquay; 2nd, Mr. H. Dammerell, gr. to Lady Macgregor.

Twelve distinct, one truss of each.—1st, Mr. H. Dammerell; 2nd, Mr. F. Hodges, gr. to C. Salmonson, Esq.

Six distinct varieties, three trusses of each.—1st, Mr. Dammerell.

Twelve single trusses of any pink Rose.—1st, Mr. J. Sloman, with Madame G. Luizet; 2nd, Mr. J. French, with Jules Margottin.

Twelve single trusses, any dark Rose.—1st, Mr. S. Hunt, with Eugène Appert.

Twelve single trusses, any yellow or white Rose.—1st, Mr. J. French, with Devonensis; 2nd, Mr. S. Abbott.

Twelve Teas and Noisettes, single truss, distinct.—1st, Mr. Narroway, Oxford; 2nd, Mr. J. French.

Best hybrid perpetual in the exhibition.—Mr. Board, with La France. Best Tea Rose, Mr. Baylis, Chelston, Souvenir d'Elise.

Division B.—In this division, Messrs. Curtis, Sandford & Co. were the prize-givers. Six Tea, Roses, six H.P.'s single blooms.—1st, a Silver Cup, Mr. J. French; 2nd, Mr. Board.

Six distinct vars., one truss of each.—1st, Mr. H. Dammerell; 2nd, Mr. A. Warren.

Six blooms, one variety.—1st, Mr. Dammerell, with *Maréchal Niel*—very good; 2nd, Mr. S. Abbott, with *Devonensis*.

Plants and Cut Flowers, Prizes offered by the Torquay Horticultural Society:—

Group of plants arranged for effect on staging 12 feet by 3 feet, Orchids excluded.—1st, Mr. F. Ferris, gr. to J. W. Kimber, Esq.; 2nd, Mr. H. Dammerell.

Groups in which Orchids were included.—1st, Mr. G. Medland; 2nd, Mr. J. Sloman.

Twelve bunches stove and greenhouse cut flowers.—1st, Mr. G. Medland; 2nd, Mr. J. Sloman.

Six tuberous-rooted Begonias.—1st, Mr. F. Ferris; 2nd, Mr. S. Abbott.

CROYDON HORTICULTURAL.

JULY 1.—The twenty-fourth summer show of Roses, plants, fruits, and vegetables of the above Society was held in the grounds of Brickwood House, kindly lent for the occasion by J. W. Prince, Esq. The morning was rather unfavourable, heavy rain preventing many gardeners from bringing their exhibits; however, about midday the rain ceased, and the afternoon was unexpectedly fine. The arrangements for the exhibition were well carried out, three large tents being provided. The classes were numerous, amounting to over a hundred, special prizes being presented by nurserymen to the

extent of £10. On the whole, the show was a surprise to most people, as it far exceeded expectations; but there seemed to be fewer large specimens, and quality seemed to be the object aimed at, which was excellent. Several nurserymen had arranged groups not for competition, which helped considerably to improve the display, notably Messrs. J. Peed & Sons, John Box, J. Laing & Son, and J. Cheal & Sons.

Cut Flowers.—This division occupied nearly the whole of a large tent, the Roses being one of the chief features of the show, which, thanks to the comparatively cool moist weather of the last few days, were of splendid quality.

In the Nurserymen's classes, open, Messrs. W. Paul & Son, Cheshunt, Herts, were 1st, for forty-eight distinct varieties, and took the National Rose Society's Gold Medal; Mr. B. Cant, Colchester, was 2nd; and Messrs. D. Prior & Son, Myland Nurseries, Colchester, 3rd. The first two won in the order of their names, with twenty-four distinct, three blooms of each. Mr. G. W. Piper, Uckfield, Sussex, came 3rd. For twenty-four distinct, Messrs. Cheal & Sons, Crawley, were 1st; and Mr. Butcher, George Street, Croydon, 2nd. For eighteen Tea or Noisette, distinct, Mr. G. W. Piper, Uckfield, was the only exhibitor. For twelve Roses, one variety, 1st, Mr. B. Cant, with fine blooms of *Mdlle. Gabrielle Luizet*; and Messrs. D. Prior & Son, 2nd, with *Fisher Holmes*. For twelve Tea or Noisette, one variety, Mr. G. W. Piper, was again the only exhibitor.

In the Amateurs' and Gardeners' classes, open, a Challenge Cup was offered, in addition to the prizes for the best thirty-six Roses, distinct, which was won by Mr. Bradbury, gr. to Dr. S. P. Budd, Larkhall, Bath; Mr. C. J. Salter, gr. to T. B. Haywood, Esq., Reigate, coming 2nd. For twenty-four Roses, distinct, E. M. Bethune, Esq., Denne Park, Horsham, was 1st, and R. E. West, Esq., Reigate, the 2nd. For six distinct, three of each, Mr. J. Bradbury was 1st, and A. H. Gray, Esq., 2nd, equal with Mr. J. Brown, Waterlow, Reigate. For twelve distinct, 1st, Mr. J. Bradbury; and 2nd, E. Wilkins, Esq., Lyndhurst, Sutton. For twelve Roses, one variety, 1st, Mr. J. Bradbury, with a fine box of *Marie Baumann*; 2nd, A. H. Gray, Beaulieu, Bath, with *Edith Gifford*. For eighteen Tea or Noisette, E. N. Bethune, Esq., was the only exhibitor. For six Tea or Noisette of one variety, A. H. Gray, Esq., was 1st, also winning the large Silver Flora Medal offered by the Royal Horticultural Society for the best Tea or Noisette in the Amateurs' and Gardeners' classes. For twelve Tea or Noisette, distinct, Mr. J. Bradbury came 1st, and Mr. J. Brown 2nd.

The National Rose Society's Silver Medal for the best Rose bloom in the Amateurs' and Gardeners' classes was won by Mr. J. Bradbury, with a fine bloom of *Horace Vernet*.

The competition in the local Rose classes was rather poor, but still some very good blooms were staged. C. J. Grahame, Esq., Coomb Lane, Croydon, showed the best six distinct blooms, and won the Challenge Cup for the year, and the National Rose Society's Silver Medal; Councillor Dart, Melrose Villa, Heathfields, came 2nd. For twelve distinct, C. J. Grahame was 1st; and the Rev. W. Wilks, Shirley Vicarage, was 2nd. For six Roses, one variety, Councillor Dart was 1st; and for six Tea or Noisette, C. J. Grahame came 1st, and J. De la Mare, Esq., 2nd. Mr. Grahame also winning the Royal Horticultural Society's Silver Flora Medal for the best Tea or Noisette in the local classes.

The twelve most graceful plants for table decoration were shown by Mr. Simmonds, gr. to C. H. Mayhew, Esq., Norwood Hill; included among them were *Pandanus Veitchii*, *Aralia Veitchii*, *Cocos Weddelliana*, *Dracena superba*, *Croton angustifolius*, C. Weismanni, &c. Mr. Lane, gr. to E. H. Coles, Esq., Burntwood, Upper Caterham, was 2nd.

Fruit.—With the exception of Grapes, there was very little fruit shown. In the open classes, some very fine Grapes were staged. Mr. G. Clinging, gr. to W. Greenwell, Esq., Marden Park, was 1st, for three bunches of black Grapes, followed by Mr. C. Blurton, gr. to H. Cosmo Bonser, Esq., M.P., Epsom, both showing Black Hamburgh. For three bunches of white, Mr. Playford, gr. to J. W. Prince, Esq., Brickwood House, with Buckland Sweetwater, was 1st, and Mr. Clinging 2nd. Mr. Clinging also came 1st for six dishes of fruit. Mr. A. G. Dangerfield, gr. to A. Steer, Esq., showed the best two bunches of Grapes in the class for single-handed gardeners.

Plants.—These were arranged in a large marquee that might have been much better filled, but good

quality reigned here as in every other part of the show. The quality was really exceptional in the plants for which Mr. King, gr. to P. Crowley, Esq., Waddon, received the *Gardeners' Magazine* Silver Medal for cultural skill (gardeners and amateurs only), in addition to the 1st prize offered for the nine best ornamental foliage, stove and greenhouse plants; among them were splendid plants of *Anthurium crystallinum* and *A. Warocqueanum*. Mr. H. Hazell, gr. to R. W. Mitchell, Esq., Fairfield, Bickley Park, came 2nd. Mr. W. King also showed the best nine stove and greenhouse plants in flower, including a fine plant of *Cymbidium Lowianum* with over forty blooms, and a well-flowered specimen of *Dipladenia boliviensis*. For a group of plants staged for effect, Mr. King was again 1st, followed by Mr. Scott, gr. to J. Aste, Esq., Ross Road, South Norwood.

The six best stove and greenhouse plants in flower were shown by Mr. H. Elsley, gr. to Capt. Wright, St. Peter's Road; and the six best ornamental foliage plants by Mr. Simmonds.

For six exotic Ferns, distinct, Mr. King was 1st with fine plants of *Davallia fijiensis*, *D. divaricata*, *D. Mooreana*, *Adiantum gracillimum*, *A. fragrantissimum*, &c.; also for six *Selaginellas*.

The tent set apart for the cottagers' exhibits, owing to the backwardness of the season, coupled with the wet morning, was rather poorly filled, but "very good" was the verdict given by all who saw them.

Obituary.

SIR GEORGE MACLEAY, K.C.M.G.—We regret to announce the death of this gentleman on the 24th ult. Sir George, who passed much of his time on the continent, had completed his eighty-first year, and died at the *Chalet de Rosiers*, at Mentone. He obtained government recognition for his services to the colony of New South Wales, and to Australia generally. Sir George came of a stock, various members of which were devoted to natural history, and of whom one was secretary to the Linnean Society many years since. The deceased gentleman was also an enlightened cultivator of art and science, and as an horticulturist was well known for the rarity and interest of the specimens exhibited from his rich collections at *Pendell Court*, near *Bletchingley*. Sir George was one of the early contributors to this Journal, and numerous plants from his garden have been published in our columns at various times.

MARKETS.

Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending June 27, is furnished from the Meteorological Office:—
"The weather remained fine and dry over the northern and north-western parts of the Kingdom until nearly the end of the week, but in all other localities the conditions became changeable and unsettled soon after the period commenced. Thunderstorms were experienced from time to time in the more southern districts, and on the 26th and 27th in Scotland,

"The temperature has continued above the mean, the excess having varied between 1° and 3° in most parts of the country; in 'England, N.W.' and 'Ireland, S.,' however, it has been 5°; in 'Scotland, N.,' and 'Ireland, N.,' 6°; and in 'Scotland, W.,' as much as 7°. The highest of the maxima, which were recorded on rather irregular dates, ranged from 83° in 'Ireland, N.,' and 80° or 81° in Scotland and over central and eastern England, to 73° in the 'Channel Islands.' The lowest of the minima were generally registered either on the 21st or 22nd, and varied from 41° in the 'Midland Counties' and 'England, N.W.,' to 49° in 'England, E.,' and 53° in the 'Channel Islands.'

"The rainfall has been less than the mean in the east of England, the north and east of Scotland, in 'Ireland, N.,' and the 'Channel Islands,' and has equalled the normal in 'Scotland, W.;' in all other districts a rather decided excess is shown. The rainfall during the 25th was extremely heavy in some parts of central England.

"Bright sunshine has exceeded the mean in Ireland and Scotland, but has not materially differed from it over England. The percentage of the possible duration has ranged from 50 in 'Ireland, N.,' and 'Scotland, W.,' and 48 in 'Ireland, S.,' and the 'Channel Islands,' to 33 in 'England, N.E.,' and 27 in the 'Midland Counties.'"

NOTICES TO CORRESPONDENTS.

ALICANTE GRAPES: J. W. C.—If the Grape-room in which the bunches were placed was cool, dry, and dark, with a very equable temperature, Grapes with thick skins would keep in a fairly good condition for five or six months; but under the most favourable conditions they would have lost in flavour, colour, and weight. But you must show the bunches cut in January at the forthcoming Chiswick Conference, on July 8, as they will doubtless create much interest amongst gardeners and others.

BOOKS: FRUIT GROWING IN AUSTRALIA: H. W. For the more temperate parts of the country, where Apples, Pears, Plums, Cherries, Quinces, Peaches, Apricots, and the Vine will succeed under orchard culture, any good gardening book. Thompson's *Gardener's Assistant*, Mackintosh's *Book of the Garden*, and Dr. Hogg's *Fruit Manual* would answer every purpose. In Queensland, many fruits tropical and semi-tropical will grow, and a useful manual to get would be, *Cultural Industries of Queensland*, by Lewis A. Berdays (Jas. C. Bell, Government printer, Brisbane); *The Reports of the Acclimatisation Society of Queensland*, and *The Proceedings of the same.*—R. S. *The Tomato; its Culture and Uses*, by W. Iggulden (171, Fleet Street, London, *Journal of Horticulture* office).

BROCCOLI: J. M. The white flowers observed were as usual not properly formed, whilst the yellow ones were fully developed.

CLEMATIS: W. H. R. Petals are but leaves arrested in their development, and proportionately modified in structure. Sometimes the course of events does not run smoothly, and then we get such intermediate forms as you are good enough to send.

CUCUMBERS DYING: E. A. H. The loss of the fruits when 2 inches long may be due to want of warmth at the root, or too much ventilation, or to eel-worms being present at the root. We cannot say which, in the absence of any samples of root or foliage, or particulars of treatment.

CUTTING A PORTION OF THE SHOOT WITH THE BUNCH OF GRAPES: H. B. P. To do this always improves the look of the bunch when this is placed whole on the dessert dish. Of course, if your housekeeper, in the fulness of her knowledge, chooses to cut up the bunch into little bits, the morsel of wood from the Vine becomes a minus quantity. When a bunch has to be kept for a time, it is always best to take a piece of the shoot—say 3 inches long—with it. Doing this rather benefits the future fruit-buds at its base, by lessening by one or two buds with each bunch the calls on the resources of the Vine. Many good gardeners shorten back all the laterals which have borne bunches, to a point 6 inches from the stem on Vines managed on the short spur method, and shorten back somewhat the lengthy shoots of Vines grown on the opposite system.

FUNGUS ON MUSHROOM BED: A. M. This fungus was named by us in the *Gardeners' Chronicle*, May 30, p. 685, under the initials "T. N. R.," *Sclerotium of Xylaria vaporaria*.

GRAPES: H. R. H. The berries are shanking in a wholesale manner. A state of things arising from defective root-action, which itself may be due to the soil having got into a bad state. Over-cropping will sometimes cause it, as also large denudation of leaves.

LETUCES FOR CUTTING IN THE WINTER: *Old Subscriber*. The best for lifting and planting in frames, when about half-grown, are All-the-Year-Round and Hammersmith Hardy Green Cabbage varieties, and Brown Bath, Hicks' Hardy White, and Paris Green Cos varieties. The idea is to plant compact-growing Lettuces, which may stand pretty close together, and which do not possess much superfluous leafage. Almost any kind of Lettuce may be sown thinly in winter in a hot-water-pit, on loamy soil, overlying a bed of tree leaves and manure, made up but a few inches below the pit-lights, and will afford a large quantity of tender leaves, which may be eaten as salad without being blanched.

NAMES OF PLANTS: R. C. B. *Lonicera Ledebourii*.—W. U. 1, *Barbarea vulgaris* fl.-pl.; 2, *Magnolia acuminata*; 3, *Heuchera*, send in flower; 4, *Euphorbia cyparissias*; 5, *Saxifraga longifolia*.—G. W. *Veronica Teucrium* var. *latifolium*.—H. Corder. *Gloire Lyonnaise*.—A. P. C. *Acrides virens*; *Dendrobium secundum*.—Weir. 4, *Ligustrum japonicum*. We cannot undertake to name Privets unless flowers and strong pieces are sent. E. W. G. *Geranium pratense*; *Spiraea japonica*; *Pyrethrum rosenum* var.—*Bellis*. 1, *Juniperus Sabina*; 2, *Allium Moly*; 3, *Dactylis glomerata* var.; 4, *Alchemilla alpina*; 5, *Salvia pratensis*; 6, *Lonicera caprifolium*.—G. B., *Helechrop*. 1, *Euphorbia Lathyris*, *Caper-spurge*; 2, *Cephalotaxus pedunculata* var. *fastigiata*, alias *Podocarpus Koraianus*; 3, *Lycasteria formosa*; 4, *Rhinanthus Crista-galli*; 5, *Pavia flava*; 6, *Cephalotaxus drupacea*.—H. W. 1, *Kalmia angustifolia*; 2, *Rhododendron ferrugineum*; 3, *Kalmia latifolia*.—J. W. 1, *Olearia Gunniana*; 2, next week; 3, *Symphytum caucasicum*.—*Old Subscriber*. 1 to 4, garden Pinks; 2, which we cannot name; 5, *Muscari comosum*; 6, *Zephyranthes rosea*.—Gordon. White flower, *Ornithogalum arabicum*; leaf, *Cyrtodeira chontalense*.—J. F. *Lycasteria formosa*.—P. A. Probably *Crataegus tanacetifolia*; send when in fruit.—*Iles*. 1, *Brassia verrucosa*; 2, *Anthericum lineare variegata*; 3, *Gymnogramma ochracea*; 4, *Lygodium japonicum*; 5, *Trachelospermum jasmiuoides*.—J. C. H. 1, *Veronica pinquifolia*; 2, *Sedum hispanicum* alias *glaucom*; 3, *Dianthus superbus*; 4, *Saxifraga cuneifolia*; 5, *Potentilla*; 6, *Myosotis azorica*.

RED ANTS AMONGST THE ROOTS OF CATTILEYAS AND CYPRIPEDIUMS: *Young Gardener*. Can you not drive the creatures out by soaking the plants in a cistern of water, leaving them therein for 30 minutes; or try *Pyrethrum* powder.

SPRUCE GALL: F. W. B. The work of *Chermes abietis*, frequently figured in our columns. The fullest account is in the *Gardeners' Chronicle*, 1874, p. 635; see also 1879, p. 248.

TOADS IN THE FORCING-HOUSE: A. B. They are greedy devourers of many kinds of insects injurious to plants, and should be made more use of. They are especially useful in Mushroom-houses and other places much infested by woodlice.

TOMATOS IMPORTED INTO GREAT BRITAIN: R. S. There is no official record of the quantity.

VINES: *Interested*. Kindly send specimens of leaves, shoots, and fruits, both healthy and unhealthy.

DIED.—We regret to announce the death, on the 21st ult., of Mr. CHARLES PENNELL, nurseryman, of Lincoln. Mr. Pennell, who had, during his management of the business, greatly extended it, and added new nurseries to those already existing, retired some time ago in favour of his sons.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.**

SLUGICIDE (Registered).—CERTAIN DEATH to SLUGS. Harmless to Plant, Vegetable, and Animal Life. Delicate seedlings are absolutely secure when sprinkled with "Slugicide." 1s. 6d. per box. All Seedsmen wholesale.

The SLUGICIDE COMPANY, 6, Maryport Street, Bristol.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supercede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

THREE ABSOLUTELY TRUSTWORTHY GARDENERS' FRIENDS.

CAMPBELL'S FUMIGATING INSECTICIDE

Big Facts:—Mr. WILLIAMS, Gardener to Earl Lisburne:—"I have given your New Fumigating Material a thorough trial. Nothing could be more simple to use, nor more effective in its work."

Big Facts:—Mr. THOMSON, Gardener to the Duke of Buccleuch:—"One of the best inventions connected with horticulture that has been introduced for many a long day. I will never use Tobacco paper again."

Mr. CULVERWELL, Gardener to Sir F. Millhaake, Bart.:—"The Fumigating Insecticide is very effectual. I have recommended it to several people."

Mr. GEO. WYTHES, Gardener to the Duke of Northumberland:—"Pleased with Insecticide; answered its purpose thoroughly; for Orchids a boon."

PRICES:—

For houses with a 1000 cubic feet, No. 3 Roll, 1/- each } Post capacity of 12000 " " " 4 " " 1/9 " } Free.
The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.

The Safest and Most Effective Liquid Insecticide for Dipping or Syringing.

Mr. FLACK, Gardener to the Marquis of Cholmondeley:—"Your Lemon Oil is most effectual and safe, destroying every insect it comes in contact with, as well as having such cleansing properties."

Mr. MILNE, Gardener to Lord Delamere:—"Your Lemon Oil Insecticide is the best, safest, and most effective I have ever used."

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half gallons, 5s. 9d.

A truly valuable remedy. Has saved thousands of Bulbs.

CLIBRAN'S EUCHARIS MITE KILLER.

Mr. B. CROMWELL, Cleveley Gardens, says:—"The result of using your EUCHARIS MITE KILLER is, that our stock of Eucharis is now furnished with dark-green leathery foliage, and pots full of strong fleshy roots."

PRICES, post free:—Half-pints, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLDFIELD NURSERIES, ALTRINCHAM;

Leaves no stain nor smell; makes the gravel equal to new. A great saving of labour. 4 Gallons, sufficient to make 100 Gallons when mixed, 7s. 6d., Carriage Paid.

THE ORIGINAL AND ONLY GENUINE.

Full Particulars and Testimonials of

MARK SMITH, MANUFACTURING CHEMIST, LOUTH, LINCOLNSHIRE.

THE STOTT PATENT DISTRIBUTOR, PATENT SPRAYER, PATENT SYRINGE, KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillar and all Insect Pests, and Prevention of Mildew.

Mr. NORMAN, gardener to the Right Hon. the Marquis of Salisbury, writes as follows under date April 20, 1891:—

Mr. STOTT. The Gardens, Hatfield House, Herts. Sir,—I am pleased to report that I consider your Distributor a very useful invention for mixing your Insecticide Killmright as it passes through the hose, supplied by gravitation.

Your Sprayer is the best I have used. It is very easy to damp a large house of plants with Insecticide without it running into the soil to damage the roots. The Sprayer may be used on either garden engine pipe, or on pipes where the water is laid on.—I am, yours truly, G. NORMAN.

Retail from Ironmongers, Seedsmen, and Wholesale and Retail from The Stott Distributor Co. Ltd., Barton House, Manchester.

NOW BEING USED ALL OVER THE WORLD.

WOOD & SON'S SPECIALTIES and PRIZE MANURES.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances what ever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER.**

Advertisements for the current week MUST reach the Office not later than Thursday noon. All Advertisements should be addressed to the PUBLISHER. Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 6d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

Cheaper Edition now ready.

TO NURSERYMEN.—SECOND, in good Nursery; age 26; eight years' experience. Plants, Cut Flowers, Tomatoes, Wreaths, &c. Excellent references.—W., Florence Villa, Sidcup, Kent.

HOLLOWAY'S PILLS and OINTMENT.

Dyspepsia, Jaundice.—These complaints are the results of a disordered liver, which secretes bile in quality or quantity incapable of digesting food. Digestion requires a free flow of healthy bile, to ensure which Holloway's Pills and Ointment have long been famous, for eclipsing every other medicine. Food, irregularity of living, climates, and other causes are constantly throwing the liver into disorder, but that important organ can, under all circumstances, soon be regulated and healthily adjusted by Holloway's Pills and Ointment, which act directly upon its vital secretion. The Ointment rubbed on the skin penetrates immediately to the liver, whose blood and nerves it rectifies. One trial is all that is needed; a cure will soon follow.

SALES BY AUCTION.

Tuesday Next.

ODONTOGLOSSUM ALEXANDRE.
CYPRIPEDIUM ARGUS.
SPECIAL IMPORTATIONS.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Rooms, 67 and 68, Cheap-side, E.C., on TUESDAY NEXT, July 11, at half past 12 o'clock, 100 lots of ODONTOGLOSSUM ALEXANDRE, guaranteed from the best Pacho district; many good varieties being seen in flower. The plants are fine masses in very good condition and have been collected and brought home by Mr. Millican. Also about 100 lots of ESTABLISHED ORCHIDS, nearly all unflowered, together with 2000 CYPRIPEDIUM ARGUS, just received direct in splendid condition, for sale without reserve. FLOWERING ORCHIDS and a quantity of CAPE BULBS in variety.

On view morning of Sale, and Catalogues had.

Leyton

Ten minutes walk from Leyton and Hoe Street stations. CLEARANCE SALE of the whole of the STOVE and GREENHOUSE PLANTS, by order of the Proprietor, who is giving up their cultivation.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the premises, La Moie, Vicarage Road, Leyton, on TUESDAY NEXT, July 11, at 1 o'clock, the whole of the STOVE and GREENHOUSE PLANTS, including several very fine specimens of MAIDEN-HAIR FERNS, GLOXINIAS, BEGONIAS, AZALEAS, CAMELLIAS, several ORCHIDS, twenty-four EUCHARIS, GERANIUMS, and a large assortment of various plants.

May be viewed day prior and Morning of Sale.

Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, E.C., and Leytonstone, E.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheap-side, E.C., by order of Messrs. F. Sander on FRIDAY NEXT, July 17, at half past 12 o'clock.

AN IMPORTATION IN SPLENDID CONDITION.

CATLEYA SPECIES, distinct in appearance and coming from a part hitherto strange to the footsteps of collectors. Closely allied, no doubt, to the IMPERIALIS SECTION; yet considerable variation appears amongst the plants now offered, and suggests the possibility of new varieties and developments of this always beautiful group.

Also a fine importation of CATTLEYA MENDELII, amongst which forces of exceptional merit will be found. Great difficulty was experienced by our collector in getting this lot together, as they came from a tract of country far beyond the district that has been so diligently searched of late years. Compact, and well formed plants, and many large masses are offered in the above lot.

CYPRIPEDIUM INSIGNE, an importation of the Cachar variety. Only a few plants received.

Also, a NEW WHITE SPANHOPEA, quite different from anything in cultivation. Only a few plants received.

CYPRIPEDIUM VENUSTUM and VARIETIES just arrived in very good order. Imported plants of this have not been offered for some time past.

There will also be included importations of DENDROBIUM NOBILE, Sander's Variety; DENDROBIUM MACRORHIZUM, CYMBIDIUM SPECIES, AERIDIES LOBBII, and a few plants of the rare DENDROBIUM AUREUM ZEYLANICUM, and DENDROBIUM MCCARTHA, and several plants of a NEW AGREEUM, with many other valuable and useful ORCHIDS.

On view morning of Sale, and Catalogues had.

Thursday Next.

Special Sale of ORCHIDS in FLOWER and BUD.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 10, at half-past 12 o'clock precisely, a fine COLLECTION of well-grown ORCHIDS in FLOWER and BUD, comprising valuable Cypripediums, grand varieties of Odontoglossum crispum, O. Pescatorei, O. vexillarium, Oncidium in quantity, choice sorts of Dendrobiums, Cattleyas, Laelias, &c. Also a case of ARAUCARIA EXCELSA, received direct.

On view morning of Sale, and Catalogues had.

Orchids.—Orchids.

MESSRS. POPE AND SONS will SELL by AUCTION, on THURSDAY, July 10, at 11.30 a.m., a fine COLLECTION of ORCHIDS, principally in flower. Catalogues forwarded on application.

No. 6, Phillip's Street, Birmingham.

WANTED, TO PURCHASE or LEASE, NURSERY GROUNDS, from 2 Acres, with some Glass erections, not nearer than 12 miles of London, and within 35 miles, with good train service.

C. P. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOR SALE (owing to indifferent health), a well-known WHOLESALE and RETAIL SEED and BULB BUSINESS, located in the first Commercial City of the North of England; the ground worked is the most populous in the kingdom, and covers a radius of 80 miles; business is done with Nurserymen, Seedsmen, Florists, Market Gardeners, Farmers, Private Enthusiasts, &c.; there is also a splendid Ready-money Counter Trade; there are Two Stores, both in commanding positions; an efficient staff, comparatively small stock. A very moderate sum will be accepted for Goodwill, Fixtures, &c.

The Trade and Capitalists will find this an opportunity (which seldom occurs) of acquiring a really genuine and *bona fide* concern. Principals only deal with.

Address, in first instance, SUCCESS, Messrs. Hurst & Son, 152, Houndsditch, London, E.C.

Banks of the Solent.

LARGE GARDEN, 16 acres, TWO RESIDENCES, 20 large GREEN and VINE HOUSES, in good order. Rent £200, valuation about £50.

ELDRIDGE, 2, West-ern Parade, Southsea.

TO BE SOLD, the TWENTY YEARS' LEASE of a small COMPACT NURSERY, situate in the North of London, 8 miles from Covent Garden. The Glass consists of 6 Greenhouses and Vineries in full profit, the largest Vinery being 116 by 20 feet. The grounds consist of 1 1/2 Acres, the chief of which is in Orchard, the whole being a good going concern.

Stock and Crop at valuation

Apply to J. W. WOODHALL, Oakleigh Road, Whetstone, N.

THE TOWER FURNISHING COMPANY (Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; one, two, or three years' Credit without Security. Purchaser have the choice of 100 Wholesale Houses. Call or write for Prospectus.

Address, SECRETARY, 43, Great Tower Street, E.C.

LAXTON'S NEW STRAWBERRIES.

LAXTON'S "SCARLET QUEEN."

The handsomest, brightest coloured, richest flavoured, and best early Strawberry yet introduced.

A very early seedling from Laxton's "Noble," fertilised by "King of the Earlies," and coming in between these two fine early sorts. Fruit large, well formed, and of handsome conical shape. Colour a bright vermilion scarlet, which is retained after packing and transit. Flesh firm, yet juicy, and of a rich, full, vinous, and Queen-like flavour. Habit strong, with bold bright-green and nearly smooth foliage. A very prolific and amply vigorous variety, and will become the best early Table and Market Strawberry of the future.

The *Gardeners' Magazine* says it "promises to prove a valuable addition, and to be especially useful for affording supplies early in the season. On June 23, 1891, we received well ripened examples, that proved to demonstration the earliness of the variety. The fruit is firm, richly flavoured, and of a bright scarlet colour; the foliage indicates a vigorous constitution."

The *Gardeners' Chronicle*.—"Good variety and early."

The *Garden*.—"A promising variety."

The *Journal of Horticulture*.—"Bright in colour and of good flavour."

Trade Price, 60s. per 100; 12s. per dozen; in small pots, half price extra.

LAXTON'S "WHITE KNIGHT."

Another most distinct and richly-flavoured Strawberry, raised from "Noble," crossed by "King of the Earlies," but quite a break from its parents. The fruit very large and handsome, longish-conical in shape; the flavour rich and vinous, with a somewhat brisk "Hautbois" taste; the flesh quite white; externally light scarlet on the upper and ivory-white on the under side, some of the fruits coming quite white. A very robust, hardy, and distinct mid-season variety, before "Sir J. Paxton."

Prices of the above three varieties, 30s. per 100; 6s. per dozen. In small pots, half price extra.

LAXTON'S NOBLE.—Now the most widely known and extensively grown of any early Market Strawberry in Great Britain and on the Continent, 6s. per 100. Laxton's "Latest of All," "John Ruskin," "Crescent," and "The Albert" (best Continental variety of recent introduction), each 20s. per 100; 4s. per dozen. "Commander," the best flavoured Strawberry ever introduced, 15s. per 100; 3s. per dozen; small pots half extra. "La Grosse Sucrée" and "Auguste Nicaise" (best early forcers), "Waterloo" (fine late), and a large general collection of all the newest and best sorts also kept.

TERMS—Nett prompt cash. For cash with order 5 per cent. may be deducted, and packing will not be charged. Orders executed in strict rotation so far as stocks will permit. References from unknown correspondents absolutely indispensable.

Descriptive Priced Lists free on application to

THOMAS LAXTON SEED GROWER, BEDFORD.

THREE ABSOLUTELY TRUSTWORTHY GARDENERS' FRIENDS.

CAMPBELL'S FUMIGATING INSECTICIDE

Big Facts:—

Mr. WILLIAMS, Gardener to Earl Lisburne:—"I have given your New Fumigating Material a thorough trial. No thing could be more simple to use, nor more effective in its work."

Big Facts:—

Mr. THOMSON, Gardener to the Duke of Buccleuch:—"One of the best inventions connected with horticulture that has been introduced for many a long day. I will never use Tobacco paper again."

Mr. CULVERWELL, Gardener to Sir F. Millbanke, Bart.:—"The Fumigating Insecticide is very effectual. I have recommended it to several people."

Mr. GEO. WYTHES, Gardener to the Duke of Northumberland:—"Pleased with Insecticide; answered its purpose thoroughly; for Orchids a boon."

PRICES:—

For houses with a 1000 cubic feet, No. 3 Roll, 1/- each } Post capacity of 12000 " " " " " " " " " " " " " " } Free.
The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.

The Safest and Most Effective Liquid Insecticide for Dipping or Syringing.

Mr. FLACK, Gardener to the Marquis of Cholmondeley:—"Your Lemon Oil is most effectual and safe, destroying every insect it comes in contact with, as well as having such cleansing properties."

Mr. MILNE, Gardener to Lord Delamere:—"Your Lemon Oil Insecticide is the best, safest, and most effective I have ever used."

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half gallons, 5s. 9d.

A truly valuable remedy. Has saved thousands of Bulbs.

CLIBRAN'S EUCHARIS MITE KILLER.

Mr. B. CROMWELL, Cleveley Gardens, says:—"The result of using your EUCHARIS MITE KILLER is, that our stock of Eucharis is now furnished with dark-green leathery foliage, and pots full of strong fleshy roots."

PRICES, post-free:—Half-pints, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLDFIELD NURSERIES, ALTRINCHAM; Also 10 and 12, MARKET STREET, MANCHESTER.

THE

Gardeners' Chronicle.

SATURDAY, JULY 11, 1891.

SIR CHRISTOPHER WREN AS A GARDENER.

ONE usually connects the name of Sir Christopher Wren only with the erection of City churches, but he deserves at least a little niche in the memory of those whose chief concern is with plants, and with the useful or ornamental disposition of the surface of the ground. I cannot discover what share he may have taken in arranging the grounds of the country homes he built or altered, but we can fancy that he may have been active in this direction, for the art of gardening was then still in its strictly formal phase, the immediate surroundings of great country houses were architectural in design, and clients were wise enough to know that the same artist who planned the structure itself should be consulted about its accessories. Moreover, there is historical witness to the fact that once, at least, he shared in the arrangement of a famous garden. About the year 1600, Queen Mary engaged Wren to make alterations in Cardinal Wolsey's former palace of Hampton Court; and, though I cannot find any detailed account of what his work on the gardens was, it is known that they were included with his purely architectural problems "Queen Mary," says Wren's latest biographer Miss Phillimore, "though she amused herself with planning the gardens and making suggestions, had yet the wisdom to defer to Wren's better taste and knowledge. Her husband, with characteristic obstinacy, insisted on his own ideas, thereby dwarfing the cloisters and marring much of the architecture. It is, however, fair to say that King William always owned that the defects were his, the merits Wren's; and these merits were very great, as any one who knows the fine old palace, with its rich red brick, its arcades, and the quaint formal gardens, will readily allow. He built, at about the same time, the pavilion and the Ranger's house in Bushey Park."

But it is in Wren's writings that we find what will be of most interest to our readers. No man ever worked harder at his own profession than he, even during the later years of his long life; yet he found time to investigate many other intellectual questions, and occasionally to write about them. An article, "On the Surface of the Terrestrial Globe," is mentioned by biographers, but is no longer extant. Another, however, "On the Rising of Sap in Trees," has been preserved. In full, it exists only, I believe, in a manuscript inserted in a volume of the *Parentalia*, a folio book of family memoirs published by Sir Christopher's grandson, and now itself a rarity. But some extracts from it are printed by Miss Phillimore, and are valuable as showing how

such a subject was approached, just two centuries ago, by a man who, although he was not a naturalist, had one of the acutest and most cultivated intellects of the time.

"It is wonderful," writes the great architect, "to see the rising of the sap in trees. All will bleed more or less when they are tapped by boring a hole through the bark, some very considerably, as the Birch, which will afford as much liquor every day almost as the milke of a cow; in a Vine, when a bough is cut off, it will, if not stopped, bleed to death. Now, by what mechanism is water raised to such a height as in Palmitos to 120 foot high? A skillfull engineer cannot effect this without great force and a complicated engine, which Nature does without sensible motion: it steals up as freely as the water descends. The reason of this is obscure as yett to naturalists." Various theories which Wren then quotes are not explained by his biographer, but, she tells us, he shows by a little marginal drawing "that the onely vicissitudes of heat and cold in ye aire is sufficient to raise the sap to the height of the loftiest trees." Mechanical explanations are then given to refute the idea that there is "a secret motion in Nature contrary to that by which plants aspire upwards." And in conclusion, Wren says:—"But though I have shown how the sap may be mechanically raised from the root to the top of the loftiest trees, yett how it comes to be varied according to the particular nature of the tree by a fermentation in the root; how the raine water entering the root acquires a spirit that keeps it from freezing, but also gives it such distinguishing tastes and qualities, is beyond mechanical philosophy to describe, and may require a great collection of phenomena with a large history of plants to shew how they expand the leaves, and produce the seed and fruit from the same raine water so wonderfully diversified and continued since the first Creation."

Special students of such questions would be glad to see the explanatory passages omitted from these quotations, although, of course, we can understand how they did not find a place in a general biography of the architect. But it is certainly interesting to discover that a man so practical and sensible as Wren, seems to have anticipated a day when even such secrets as the transmutation of inert into living matter would be explained. Unfortunately, our "collection of phenomena" and our histories of plants, vastly though they have increased during the past two centuries, have brought us no nearer to the reading of riddles of this sort.

When discussing the condition of the churches of London, and the best way of repairing them, Sir Christopher once wrote: "As to roofs, good Oak is certainly the best, because it will bear some negligence. The churchwardens' care may be defective in speedy mending drips; they usually whitewash the church, and set up their names, but neglect to preserve the roof over their heads. . . . Next to Oak is good yellow deal, which is a timber of length, and light, and makes excellent work at first, but, if neglected, will speedily perish; especially if gutters (which is a general fault with builders) be made to run upon the principal rafters, the ruin of the church may be sudden. Our sea-service for Oak, and the wars in the North Sea, make timber at present of excessive price. I suppose, ere long, we must have recourse to the West Indies, where most excellent timber may be had for cutting and fetching."

Wren lived, as I have said, before the time when naturalistic methods of gardening art were

introduced, and very long before the establishment of great rural cemeteries for the reception of the dead of cities. In his day it was customary to bury in churchyards, and actually within the walls of churches, even in the densest parts of London. But he was too intelligent a man not to protest against so dangerous a practice, and, in one of the many reports on architectural and urban questions which he wrote, we find what his conception was with regard to the proper disposal of the dead. If they are not interred in or near the city churches, he says, "It will be inquired, where then shall be the burials? I answer, in cemeteries seated in the outskirts of the town. . . . A piece of ground of 2 acres in the fields will be purchased for much less than 2 roods among the buildings; this being enclosed with a strong brick wall, and having a walk round, the two cross walks decently planted with Yew trees, the four quarters may serve four parishes, where the dead need not be disturbed at the pleasure of the sexton, or piled four or five upon one another, or bones thrown out to make room. . . . It may be considered further, that if the cemeteries be thus thrown out into the fields, they will bound the excessive growth of the city with a graceful border, which is now encircled with scavengers' dung-stalls." To-day we should hardly consider such cemeteries a "graceful border" to a city, although, it must be confessed, too many in America are encircled by the more unpleasant heaps of refuse with which Sir Christopher desired to do away. His words convey, I may add, an exact picture of many cemeteries still in use near European towns; but, though they are much larger than the churchyards which preceded them, the horrible results of overcrowding cited by Wren as existing in such yards, may often be witnessed within their wider yet now insufficient and inelastic walls. I have myself seen, in German cemeteries in the outskirts of cities of the first class, even the piling of three or four bodies one upon another, and this not in portions devoted to the poor, but in lots owned by aristocratic families. *M. G. Van Rensselaer, in Garden and Forest.*

NEW OR NOTEWORTHY PLANTS.

ADA LEHMANNI, *Rolfe, n. sp.**

For many years the well-known *Ada aurantiaca*, Lindl., was the only species of the genus, but now a second one has appeared. My first acquaintance with it began in September, 1888, when Mr. James O'Brien, of Harrow-on-the-Hill, sent it to Kew for determination. In the following July it was sent again, by Mr. J. E. Bonny, Hextable Nursery, Swanley, Kent, who presented a living plant to the Kew collection, where it has since flowered. In January, 1891, Mr. F. W. Moore sent it from Glasnevin, and now it comes from Mr. H. J. Ross, of Florence. It was introduced to Europe by Mr. F. C.

* *Ada Lehmanni*, n. sp.—Habit of *A. aurantiaca*, Lindl., but more rigid. Leaves arcuate, linear, acute, coriaceous, dark green, more or less distinctly marbled with grey blotches, 8 to 12 inches long, 6 to 11 lines broad. Scapes erect, rather shorter than the leaves, racemes with five to eight flowers. Bracts lanceolate, acute, 5 to 8 lines long, a little shorter than the pedicels. Sepals and petals subconnivent, subsimilar, linear-lanceolate, acute, somewhat fleshy, bright cinnamon-orange, 1 inch long. Lip oblong-lanceolate, acuminate, with incurved undulate margin and recurved apex, about three-quarters as long as the sepals. Colour white, except the very fleshy, linear, velutinous, thickened callus, which is deep orange-coloured, and extends from base to near the summit. On either side of this callus, about a third of the distance from the base, is a curiously recurved white hook, almost like the prickles of a Rose-bush in shape, the use of which is not easy to divine. Column short and stout, dull yellow, with a pair of large fleshy auricles at base. Native of New Granada. *R. A. Rolfe, Herbarium, Kew.*

Lehmann, German Consul in the Republic of Colombia, alter whom I have great pleasure in naming it. It is a very distinct species, easily distinguished from *A. aurantiaca* by its more rigid habit, shorter, broader, and darker green leaves, which are everywhere marbled with grey, sometimes very distinctly so, at others more obscurely, and by its white lip. It is also decidedly a summer-flowering plant, while *A. aurantiaca* is well known to flower during the winter, when its brilliant orange-coloured racemes are very useful. The colour of our novelty is equally brilliant. It may be added that the name was circulated, and the description prepared at least two years ago, but for some reason it never got into print. *R. A. Rolfe.*

A NEW HARDY MAGNOLIA.

In the *Botanical Magazine* of February last, Sir Joseph Hooker described a new species of *Magnolia* under the name of *M. Watsoni* (alter the Assistant-Curator of Kew), the plant having been purchased from a collection of native plants in the Japanese Court of the Paris Exhibition of 1889, where it was exhibited as an unnamed species. This plant flowered last June in the open air at Kew, and a drawing of it was made for the magazine. A very fine specimen of this same *Magnolia* has been sent to me by Messrs. Veitch, who have lately flowered it for the first time in their Coombe Wood nursery, where they have grown it, fully exposed, for the past two years, the plants having been received direct from Japan under the name of *M. parviflora*. On seeing the flower, I at once recognised the similarity to the *Botanical Magazine* figure, and on showing the flower to Mr. Hemsley at the Kew Herbarium, he said at once it was the new *M. Watsoni*, and he kindly showed me the native drawings and specimens of the true *M. parviflora* and allied species. The true *M. parviflora* and this new *M. Watsoni* are so obviously distinct from each other, that it is strange that the two species should have passed under the same name, as they evidently do in American nurseries; and stranger still is the fact that such a conspicuous and beautiful tree has so long escaped the botanical travellers in Japan, and has not been figured by native artists in the Japanese floras.

Professor Sargent (at p. 739, vol. ix., of the *Gardeners' Chronicle*) is evidently of the opinion that the true *M. parviflora* and *M. Watsoni* are distinct, and it is satisfactory to read that both flourish and flower well in the Flushing nurseries.

We have, unquestionably, in this *Magnolia* a grand addition to hardy trees—one that promises to adapt itself to our climate as readily as other Japanese species do, though probably, as Professor Sargent observes, the hot and dry summers in America are more favourable to Japanese plants than ours.

Those who can refer to the *Botanical Magazine*, t. 7157, may see a truthful portrait of this new tree, though the Coombe Wood specimen was somewhat larger than the flowers illustrated. To describe it, one must compare the flower with that of the evergreen, *M. grandiflora*, as it is almost as large, and has similar large and broad ivory-white petals, incurved and shell-like. The sepals are tinged with a delicate rose-pink, which at once distinguishes it from other *Magnolias*. The conical pistil rises 2 inches, and at its base are numerous rows of stamens with rich crimson filaments, and reddish-yellow, or terra-cotta-tinted anthers—a combination of colour that makes the flower very striking. The flower sent is $6\frac{1}{2}$ inches across, and has a powerful spicy perfume like that of its congener, *M. glauca*. The leaves are about 6 inches long, by about half as broad, like those of *M. Yulan*, deep green above, pale beneath. It appears to be a sparsely branched low tree, the solitary flowers terminating the young branches. The Coombe specimen is about 4 feet high, and the specimens at Kew received from America, under the name of *M. parviflora*, are of similar size. The true *M. parviflora* has much smaller leaves, broadly ovate, and pointed, while the flowers seem to be only a third the size of *M.*

Watsoni. *M. parviflora*, is not, I believe, in cultivation in this country, neither have I seen *M. hypoleuca*, though it may be in the Kew collection. *M. Kobus*, which Professor Sargent states as being the hardiest of all the Magnolias, is at Kew, but is not, I think, in the nurseries here. From the figures, it appears to be a handsome species. *M. stellata* is becoming tolerably common now, and thrives everywhere, though late frosts are liable to spoil it just when in flower or bud. *W. Goldring*.

THE INFLUENCE OF STOCK UPON SCION.

ABOUT a year ago, a large number of experiments in herbaceous grafting were performed by a student under the direction of Professor Bailey, and, among others, a trial was made of grafting a portion of a half-grown Dwarf Champion Tomato upon a similar fruit of the Ignotum variety, from which a corresponding piece had been removed. In habit of growth, as well as in fruit, the Dwarf Champion is very distinct from the Ignotum; the former has thick and short-jointed stems, thick, crumpled, dark green leaves, and the fruit has a distinctly purple tinge; the Ignotum is similar in character to the common red varieties. The two parts of the graft united and grew to maturity, after which the seeds were removed and planted, care being taken to keep the seeds of the two halves, stock and scion, separate.

The results obtained from the seeds of the scion half of the fruit, the Dwarf Champion, were very striking; so surprising, indeed, that it was decided to distrust the accuracy of the records of the experiment until it should be confirmed by further trials. Soon after their appearance above ground, the plants from these seeds began to show some of the characteristics of the stock. As the plants developed, this resemblance to the Ignotum increased, until at maturity both the plants, and the fruit which was produced, were undistinguishable from the pure Ignotum variety.

The interesting development of this experiment led to its repetition during the past winter, the work being carried on by means of the Tomato plants growing in the forcing-houses of the Experiment Station. Of the grafts thus made, a part were Ignotum upon Dwarf Champion as a stock, the reciprocal of that mentioned above, and from the seeds of the scion-half young plants are now growing which again show a very decided influence from the stock, being plainly intermediate in character of leaf and in habit between the two varieties, thus confirming to that extent the observations made during last year's experiment. The further developments of the plants and their fruit will be looked for with great interest, since, among the many forms of grafting which have been practiced in the past, few, if any, records are to be found of such a preponderating influence of the stock. *Garden and Forest*.

THE HERBACEOUS BORDER.

HELIANTHUS OCCIDENTALIS.

A PLANT has been sent out for three or four years from Hale Farm nursery, and exhibited under this name. It is figured in Mr. Ware's last catalogue of hardy plants on page 32. It is certainly not *H. occidentalis* of Riddell, as described in Gray's *Flora of North America*. It flowers much earlier, has larger flowers, and is distinct in many characters. The true *H. occidentalis* has been cultivated by Mr. W. Thompson, of Ipswich, for several years, and distributed by him. Those who have Mr. Ware's plant, and will compare it carefully with the description of *Helianthella quinquevervis* (Gray) in *Flora of North America*, vol. i., part 2, p. 284, will, I think, be satisfied that it is that plant. *C. Wolley Dod, Edge Hall, Malpas*.

SILENE ARMERIA.

A few clumps of this species are very telling in our herbaceous border at present, and for these we are indebted to a friend, who gave us some small self-sown plants early last September. These were planted at once in clumps of three each, and now form masses of flower 15 to 18 inches high, and the same in diameter, of a deep rose colour. Being light in appearance, and lasting well, it is very useful for cutting for room decoration, the colour showing well by artificial light. It is a plant worthy of being generally cultivated. *W. H. Dicers, Ketton Hall Gardens, Stamford*.

GERBERA JAMESONI.

It is some four years since this lovely Composite was introduced from Barberton, Transvaal, and therefore it has hardly had sufficient time to get into general cultivation. Specimens in pots have flowered at Kew and in these gardens in the open air; and one thing in its favour is, that it has withstood the cold of the past winter, and is now coming into flower. They stand amongst the *Opuntias* at the foot of a wall looking south at the end of the stove, somewhat protected on the east by the projecting Lily-house. Glass lights are placed over the *Opuntias* late, to keep them dry, the front and sides being open, and the dryness thus afforded the plants helps them to pass the winter unharmed; for a plant which was placed in the open border, although it grew vigorously during the summer, perished in the winter. It is highly probable that this *Gerbera* will figure on rockwork and other suitable positions when it gets better known. On rockwork it should have a warm position, and be protected in winter by means of a piece of glass placed over it, as is done for other doubtful plants. It is not fastidious as to soil, good loam and leaf-soil and coarse sand forming a compost, in which it grows freely. I also notice that when planted in a shaded position, the plant is attacked by a leaf-mining grub. Our plants were raised from seeds sent by Mr. R. W. Adlam of Natal (see *Gardeners' Chronicle*, June 23, 1888, p. 775), and in his note he mentions that the flowers last several days without changing colour; Mr. Watson of Kew, writing concerning this plant, says they last in flower a fortnight, while in the open air at Cambridge they last from a month to six weeks.

I have scanned several of our leading seedsmen's catalogues, in order to find out whether or no this is offered to the public, but have failed to find it, and seedsmen would do well to procure seeds for their customers. *W. Harrow, Botanic Garden, Cambridge*. [The plant was figured in our columns, 1889, June 22, fig. 122. Ed.]

ROSES.

INDOOR CLIMBING ROSES.

UNDER the above heading (on p. 760, vol. ix.), Mr. Cook mentions that Rose William Allan Richardson makes too much growth, and produces few flowers when planted out under glass. I feel this should not be let pass without comment, as this Rose, if properly grown, is far more free-flowering than half of the varieties grown. The great mistake, made when growing these strong habited Roses under glass, is that they are pruned too severely. Mr. Cook mentions that this variety does better on outside walls; why not treat it the same inside? Then the results will be found to be far and away better than upon plants grown outside, as this plant makes late growth, which cannot be ripened nearly so thoroughly outside, as under glass. I have plants of this variety that bore some 500 to 600 grand flowers upon each early in May, and that are again in flower (June 20), and carrying 300 blooms and buds. These will flower again in August, or early in September.

In fact, I know of no Rose that is freer flowering if rationally treated. Too many growers, even now, prune back the long growths made by many

varieties, with the result that they practically cut away the flowers, and more long shoots are produced. If William A. Richardson is planted out, and treated in the same way as *Maréchal Niel* or *Gloire de Dijon*, *ic.*, all the long and ripened growths left to flower, this variety will be found far more free than either, and greater praise could not possibly be given it.

William A. Richardson blooms two or three times a year, while the *Niel* will only carry one really good crop. If people would only let these strong climbing varieties grow as they choose, and simply endeavour to assist them all they can by ripening the growth when completed, we should hear no complaints on the score of shyness of flowering. All strong growers will flower upon the long shoots, if these are matured. The only pruning required with these varieties being, to cut away the growth as soon as it has flowered, so as to throw all the strength of the plant into the young shoots growing on for another crop of bloom.

If treated in this manner, there are hardly any strong-growing Roses but what will do well under glass, provided sufficient room can be given. *A. Piper Sasser*.

THE WINTER OF 1890-91.

Pursuing one's course along the western and south-western counties, we come to such centres of Rose growing as Bath, Exeter, and Torquay, and portions of the country from whence we do not expect to hear tales of disasters from frost and injury from severe weather, but, as will be found, that in some cases there is very little difference in the effect from that experienced in other districts. Messrs. Cooling & Son's nursery at Bath is situated on high ground, it being about 350 feet above the sea-level, and could not therefore be subject to such damage as might be expected in low-lying land. The soil is a stiff loam, and the effect of the winter has been that which we find in most places; the thermometer did not fall below 10°, or 22° of frost—considerably less than in many places, yet they inform me that the effect has been disastrous; the majority of Teas are killed to the ground, and standard Teas killed out right; while the H.P.'s, except those of more tender constitution, are uninjured. The varieties of Teas which have suffered most are *Madame de Watteville*, *Countess de Nadaillac*, *Niphotos*, and *Madame Falcot*. From Mr. Alex. Hill Gray, whose garden is one of the most remarkable in England, I have a different account: he says, his Roses are comparatively uninjured; and a friend who has seen it, says it is the only garden he has seen where Teas have proved strong.

Midway between Bath and Exeter lies the pleasant county town of Taunton, where horticulture is enthusiastically carried out by many amateurs; one, Mr. W. Herbert Fowler, has of late years cultivated well and extensively, in a very delightful garden, both Teas and hybrid perpetuals; and it will be seen that in his favoured position he has not suffered so much as many others. "I have not lost," he says, "more than one per cent. of my Teas, though of course they are cut down to the ground in most cases. I note that those on the seedling Briars have suffered less than those on the *Manetti* (but why grow any Teas on *Manetti*?); many of the former have lost no wood at all. None of my standards have suffered, and the *Maréchals* are breaking grandly. I have lost more H.P.'s than Teas; the latter were not protected at all, except by earthing them up like Potatoes." This latter experience reminds me of the manner in which my late friend, the Rev. W. F. Radclyffe, used to be sneered at when he first advocated this method of protecting his dwarfs, and yet now nearly everybody, and amongst them those who used to ridicule the notion, have adopted it. Although some of his opinions about Roses, which he really loved, were eccentric, yet on this point he proved himself to be before his age. There is no need to say anything as to the right of Mr. R. G. Baker, of Ilcavittree, Exeter, to be considered an authority on all matters connected with the Rose, and from his favoured locality we might naturally expect to receive not so sad a story of the winter's loss as from other places;

his garden is a sheltered one in the suburbs of the old city of Exeter. The soil is light and rich, resting on red sandstone; the height above sea-level is 135 feet, and the lowest reading of the thermometer at the Devon and Exeter Hospital close by was 19° of frost, considerably lower, it will be seen, than that of the previous stations, and this is his report:—"My Roses have, as a whole, wintered well, and I have lost very few. I notice that newly-planted Teas have not suffered so much as older plants, the strong growers more so than the weaker ones. Madame de Watteville has suffered more than any other Tea with me, the whole of these having been cut down to the ground; the H.P.s have broken very well, but the cold and frost of this month have checked them badly. My first bloom of a Tea Rose, Amazon, opened to-day (May 28) under a wall. In connection with the cold wave of May 17—19, the thermometer did not go below 32°. "I notice, too, that he speaks of Madame Bérard and Marie Van Houtte, both strong growers, having suffered very much. This is somewhat remarkable, as they are both strong and sturdy growers, the former a decided Dijon, and the latter growing most vigorously; it may be that they were fuller of sap, and so felt it the more.

Descending still further south, we come to the famed district of Torquay; not that, were I about to commence Rose-growing, I should choose either Devon or Cornwall as the scene of my operations. The climate is mild, but it is also moist, and there is therefore a great danger of the wood not being properly ripened, so that if frost should set in, they would be caught at a great disadvantage, and I know that in Cornwall it is next to impossible to grow Roses fit for exhibition purposes. I have received the following information from Messrs. Curtis, Sandford & Co., of the Devon Rosery, Torquay. The lowest temperature they noted was 16.8, not quite 16° of frost, which, it will be seen, is lower than any yet noticed; the situation is only a few feet above the sea-level, but then that sea is one which feels the influence of the Gulf Stream, and they say that there is no injury done to buds or plants of Teas, except the autumn growth, which was a little singed. Hybrid Perpetuals received no damage whatever, but their opinion that Tea Roses will not suffer any more than hybrids from severe frost, provided the wood is ripe, is not borne out by any other growers—and, of course, up to 16° of frost, it may be true; and as that is the lowest temperature they record, it cannot be adduced as evidence against the opinion of so many others. I may instance this by the case of Lemoine's hardy hybrid Gladioli, which have claimed for themselves the advantage of being left in the ground, and so saving the trouble of lifting. I have had them for seven or eight years, and have only this spring written in their favour; but this last winter has been too much for them, and I have lost every one. Of course, previous to this winter, I should have told everyone, "Oh, yes, they are perfectly hardy—as hardy as the common wild one;" but if I had only 16° of frost, I should most probably have continued to sing their praises, until some unlucky wight who had been seduced by my statements had gone in for them, and found they could not stand the 28° of frost he had experienced.

Each day brings me curious statements with regard to the condition of Roses; one of the growers mentioned in my last paper says, "My Teas are not what they ought to be; they ought to show different. I do not think there is the smallest chance of there being any ready for the 23rd. I do not mean them only, but others. Why don't you postpone the show till the autumn—I mean September. I may give as an instance of the extraordinary character of the season, that I have eight varieties absolutely budless." This is, indeed, a gloomy picture; but it will be seen from the reports given in this paper that it is not altogether so bad, and I have no doubt that, as I have told my friend, we shall have Roses on the 23rd, though probably the spoils of victory will go to other places. *Wild Rose, June 16.* [The results seen at the Rose Shows since this was written have confirmed our correspondent's prevision. Ed.]

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CATASETUM ATRATUM, Lindl. (♂ AND ♀ ON SAME RACEME).

A VERY interesting example of the production of male and female flowers on the same raceme has just occurred in the collection of Mr. William Brooks, F.R.H.S., Whitecross Nurseries, Weston-super-Mare, and has been sent to Kew for preservation in the Herbarium. Seven flowers were developed, of which the third and sixth (counting from the base) were females, the others being males. The females expanded several days before the males, thus furnishing an example of earlier maturity in this sex, for the lowermost flowers usually expand first, while here the sixth one opened before the first. Several buds at the apex were arrested at a very early stage, doubtless through lack of nourishment. An interesting feature about this species is, that the segments of the flower are less dissimilar in the sexes than usual. In both they are light green, with numerous small blackish-brown spots. The lip in the female, though shorter and more hooded than in the male, has a similar thickened whitish reflexed apex, also numerous lateral teeth, though smaller than in the male. It is the first *Catasetum* I have been able to identify from the female alone on its first appearance, for I may add that one of the two female flowers was first sent for determination, while the males were still unexpanded, and their different structure unsuspected. The sexual organs present the usual differences; the column of the female very short, stout, and without antennæ or pollinia; that of the male longer, more slender, with perfect pollinia, and a pair of subparallel antennæ, in the same plane, directed into the cavity of the lip, which organ is superior in both sexes. Rodriguez (*Gen. et Sp. Orch. Nov.*, II, p. 220) records the female as seen by him in Brazil, a scape of two flowers, apparently much like those now produced in this country, but it is not stated whether males were also produced on the same plant. There are several other *Catasetums* in cultivation in which the females are not known, and, on the other hand, one or two females which cannot be determined for want of the male flowers, so that any instance of the appearance of both sexes is specially interesting. *R. A. Rolfe.*

ORCHIDS AT HAZELBOURNE, DORKING.

The pretty residence, and its delightfully situated gardens, of Welbore Ellis, Esq., situate on the south-west side of Boxhill, has for some time been making a choice collection of Orchids, and for which a proper provision was made at the start. *Odontoglossum crispum* was always the favourite at Hazelbourne, and fine forms were continually being acquired, but not sufficiently fast to satisfy the wishes of the proprietor. In gratifying a taste of any description, a rich man, like Mr. Ellis, has always the facilities if he will but make use of them. That in this case he wisely did, and sent out Mr. Mellican as collector. He had previously done work in a similar capacity, and has recently returned to this country with some 6000 grand pieces, specially collected for Mr. Ellis. The Orchid establishment is as yet of moderate pretensions, but this latest addition sufficiently indicates that it is being increased in no half-hearted manner; and, in securing the services of Mr. Gostling as his gardener, he has a good guarantee of success.

In the first house, *Calanthes* were growing luxuriantly, and without any indications of "spot" on their leaves. *Dendrobium nobile* and *D. n. nobiliss* were making fine growth; and the more difficult *D. Deari* was growing very freely. Plants of *Cattleya aurea* have flower-sheaths, and two nice plants of the new *Cattleya Rex*, a marvellously fine thing, were observed. *Cypripedium bellatulum*, *C. Godefroyæ*, and *C. niveum* grow finely in this house, which is kept very warm and moist.

In the next house to this one, the general collection of *Cattleyas* were found; one fine specimen of *C. gigas* was noticed, having five blooms on one spike,

Several varieties of *C. Mendeli* were in bloom, one a very richly-coloured variety with a well-fringed lip. The *C. Mossiæ* are nearly over, but enough remained to show the excellence of the strain. Other noticeable plants consisted of *Lælia Boothiana* (*Cattleya lobata*), *L. elegans*, *L. purpurata*; and with them the *Cymbidiums*, *Thunias*, and *Dendrobiums* were growing vigorously.

In the next house, an intermediate one, the *Lycastes*, *Dendrobium Jamesianum*, *Odontoglossum grande*, *Oncidium prætextum*, *O. Krameri* were growing freely, some of them being furnished with strong flower-spikes; and in the cool-house, the *Odontoglossum crispum*, *O. triumphans*, *O. Corradinei*, *O. Pescatorei*, *Oncidium macranthum*, *Epidendrum vitellinum*, &c., made a fair display.

GROWING ALPINES IN SPHAGNUM.

FROM all sides I receive letters and enquiries concerning this new method of cultivation, and I propose to reply through the *Gardeners' Chronicle* that all may hear about it, and that I may make known the results of my experiments. On March 20, I set up on a wall exposed to the full sunshine, three large pans pierced with numerous holes which were originally intended to hold epiphytic Orchids. I filled these pans with sphagnum eight years old, which at first sight appeared quite worthless, but I had no other handy, as at Geneva sphagnum is dear and rare.

I planted in the sphagnum—I, a poor unfortunate plant of *Arnica montana*, L., which had begun to turn yellow and withered, and which was the only one left out of a collection of plants sent from our alpine botanic garden at Bourg St. Pierre, where the plant is wild, abundant, and sturdy; 2, a plant of *Astrantia minor*, L., raised from seed in the garden here, and in good condition; 3, *Gnaphalium Leontopodium*, Scop., a seedling a year old, fairly healthy, but showing no signs of bloom; 4, *Chrysanthemum alpinum*, L., brought in good condition from the Liunna last October, but which now appeared dying; 5, *Androsace helvetica*, Gaud., a young plant brought from the Alps last September; 6, *Parnassia mysoensis*, Heyn., received last year from England, but which had suffered much and seemed nearly dead; 7, *Saxifraga aizoides*, L., brought last autumn from S-embrancher (Valais) to our Geneva garden; 8, *Saxifraga carpathica*, Reich., raised from seed in the garden, but which had suffered much from the droughts of last summer; 9, *Saxifraga stellaris*, L., brought from the Alps last September; 10, lastly, a plant of *Soldanella alpina*, L., brought from the Jura, and too sickly to bloom; it had not even any buds, and seemed likely to die.

These plants are some of the most difficult to preserve, to keep healthy, and to bloom in the dry climate of Geneva. Many, such as *Arnica montana*, *Saxifraga aizoides*, *Parnassia mysoensis*, and *Chrysanthemum alpinum*, it is impossible to cultivate here, and I have quite given up attempting to acclimatise them; I content myself with raising them in Valais, and bring them down here when I want them. As to *Edelweiss*, we raise it easily by growing it on calcareous soil in a sunny place, but its appearance is different, and it lacks its silvery-white colour. A *connoisseur* glancing down our list of plants will at once see that these belong to soils which, chemically speaking, are very varied, some (*Edelweiss* and *Androsace helvetica*), belong to the calcareous flora, while others (*Arnica*, *Chrysanthemum alpinum*, and *Saxifraga stellaris*), grow usually on an essentially silicious soil. Again, some (*Astrantia*, *Saxifragas*, and *Soldanellas*), are typical of the vegetation of marshes and the borders of streams; others (*Arnica*, *Androsace*, and *Gnaphalium*), grow wild on dry slopes. Therefore, it is to be supposed that, considering their usual conditions of existence and their different habitats, the ten plants which I placed in sphagnum, and for the roots of which I allowed but little earth, in some cases not at all, being submitted to the same treat-

ment, would bear it differently according to their affinities. This was my idea. Now, the facts—nothing is so convincing as fact—showed me that I was wrong. Soon—that is to say—at the end of two days' exposure to the full sun—we were then favoured with some sunshine, the pans being watered every morning, the Soldanella seemed to regain life, and I saw some new leaves coming up in the centre. In the Arnica, which had had such yellow leaves, there was quite a transformation at the end of eight days, for it turned a beautiful green; then, at the end of three weeks, I saw the heart of my plant swelling, and soon a bud appeared which grew so well that on June 7, I was able to show at the meeting of the Geneva Horticultural Society the first Arnica montana which has flowered at Plainpalais. Our local papers considered this such a piece of news, that they devoted some lines of *faits divers* to it. My plant was strong and vigorous, as it is usually only seen on the Alps, with stem erect, and flower perfect in form and colour. Impossible to imagine it in better condition. At the same meeting I showed my Edelweiss with two handsome flowers, the usual size or even larger, of excellent form, and above all of a pure white colour, such as is seen on the high Alps. The three Saxifrages were, and are still, in full flower as if growing wild, only still more crowded, and with more defined characteristics. *Chrysanthemum alpinum*, which I had never been able to bloom at Geneva, is now quite covered with fine and properly-sized flowers, and shows many buds which I hope will soon open. The other plants, although sturdy, have not yet bloomed. The *Astrantia* seems to me about to flower, in spite of the youth of the specimen. As to *Androsace helvetica*, it is stationary, but seems in good condition. Such are the facts. To me the question seems settled, and that in spite of the amendment which Dr. Briosi, the Director of the Pavia Botanic Garden, was kind enough to address to me when my first article on this subject appeared in the *Gardeners' Chronicle*. M. Briosi, who has control of the horticultural work done at Pavia, and who, indeed, first instigated it, told me that I was mistaken in my idea that the alpine which I had seen in his garden were grown in sphagnum moss only, for that they were in a mixture of equal parts of Chestnut charcoal, *terre de bruyère* (beath mould), and sphagnum. The Professor did not think it likely that plants would grow in sphagnum only. In spite of his opinion, I continued my experiments, and they have succeeded. Do I imagine that the system advocated by the Italian *savant* is worthless? No, for I have myself tried it, and put it to the test. But I maintain that grown in sphagnum only, in full sunshine, the most delicate alpine plants succeed admirably. "Feet in the water, crown in the fire," this just reverses the requirements of the human body. It must be added that damp sphagnum gives off all day a considerable and beneficial amount of moisture, which wraps the plants in a damp cloud, as is the case with them on the Alps. Later on, I will refer to an experiment on a large scale, which I am going to try when I have sufficient sphagnum. *H. Corretton*, Director of the Alpine Garden, Geneva.

PLANT NOTES.

PERENNIAL CANDYTUFTS.

AMONGST the earlier summer flowering hardy plants, the neat evergreen species of *Iberis* are in all respects the most accommodating and showy of hardy border plants. The prevailing colour of their flowers is white, but as they bloom at a time when bright-coloured subjects are well represented by *Aubrietias*, *Alyssums*, *Phloxes*, &c., their effect is rather complementary than otherwise. There are a great many forms of the hardy perennial *Iberis*, some being much harder than others, and perhaps no species is harder or more accommodating than the old *I. sempervirens*, and it is not particular as to soil or situation, provided it be not overshadowed by other

plants, or encroached on by rampant-growing subjects, and being a sub-shrubby species, rarely growing more than 1 foot high, and evergreen. Like the rest of the perennial sorts, it is specially valuable in giving rockeries and small herbaceous borders a partly-furnished appearance during the winter months. There are several varieties, one named *I. s. superba*, having larger and denser heads of flowers; another is *I. s. Garrexiana*—and where variety is a consideration it might be included. But variety is better attained by growing distinct species, such as *I. corifolia*, a plant somewhat similar to *I. sempervirens*, but scarcely half as large as that species. *I. correnfolia*, is abundantly distinct and readily known by its large entire leaves and large corymbose heads of flowers, with individually large flowers—the plant is a robust grower. In *I. Priuti*—we have an exceedingly neat and floriferous plant, growing only a few inches high, with large white corymbs of flowers of a pinkish tint, owing to that colour being present in the sepals of the unexpanded flowers. Very similar to this species, is *I. Tenoreana*—but I have not found it quite so hardy, indeed, it is almost a biennial, although it may come in the same position for years from self-sown seeds. *I. gibraltaria* and *I. g. hybrida*—are large and desirable *Iberises*, but apt to go off during winter. *F. R.*

STYRAX JAPONICA.

OF the many hardy Japanese trees and shrubs we have now in our gardens, I do not know one that combines such elegance of growth and chaste flower beauty as this *Styrax*, which now is, or was quite recently, one of the chief attractions of the Coombe Wood nursery, and of which I have before me a great flowering branch hung with numerous pendent snow-white blossoms, which, for the sake of description, may be compared with the flowers of the well-known *Solanum jasminoides*, though they are larger, and of more substance, and, moreover, fragrant. It is a deciduous shrub, growing from 6 to 12 feet high, according to soil and locality, and being very twiggy, makes a dense bush, the branches arranging themselves in broad flat tiers. The flowers are borne on slender stalks about an inch long, in twos and threes, from the leaf axils of every tiny twig, so that a small bush bears thousands of flowers expanded at once. It is quite a hardy shrub, beyond a doubt, as Messrs. Veitch, who introduced it, have had it growing for years in their Coombe Wood nursery, fully exposed, and there one sees it every year in profuse bloom. But though it is hardy enough, I think it is one of those shrubs that during the earlier stages requires some sort of protection until it becomes thoroughly established. It should be planted in a nook exposed to full sun, but sheltered from northerly and easterly winds, and if with a background of evergreen growth, its effect at flowering time will be heightened. It is certainly the most valuable of all the *Styraxes* for the garden, and I should always include it among the choicest selection of shrubs. Its value is becoming known, as I observe that other nurserymen are taking it in hand besides Messrs. Veitch. *W. Goldring*. (It was figured in *Gardeners' Chronicle*, 1885, p. 745, fig. 166.)

CEREUS PERUVIANUS, Haw.

Many people dislike the Cactus family, considering them not worthy of notice on account of the stiff and formal habit usually present in most of the species. Could those who hold this opinion see the largest specimen growing in this garden, covered with hundreds of large white flowers, which expand during the night and remain open until the sun closes them about midday, their notion would probably be somewhat changed after witnessing such a grand floral exhibition. It is only during the early morning the flowers are seen to perfection. As soon as the sun shines fully upon them, they gradually close and wither entirely. To-day (May 15) no smaller a number than 319 were counted fully expanded. And a similar number have been open for several mornings past, sometimes not quite so many opening at the same time. The columnar stems are slightly spiny, 6-angled, the taller being

about 35 feet high. This specimen can be seen growing at a spot partly surrounded with luxuriant vegetation. The larger stems, a few feet from the ground, measure 2½ inches in circumference. The size of the flowers across their greatest diameter is about 8 inches, length from base 8 inches. Some of the flowers appear to be fertilised, so that good seeds may be looked for at no distant date. It bears a fruit about 2½ inches in diameter, and about 3 inches in length, of a rosy colour, with dark and numerous seeds embedded in a pulpy interior. The juice of the fruit is used as a colouring matter by local confectioners, especially by sugar-boilers for candy. *W. E. Broadway*, Trinidad.

ARNEDIA ECHIOIDES.

This Boragewort, popularly known as the "Prophet Flower," is without doubt one of the best of hardy border plants, continuing for a long time in bloom when grown under favourable conditions. In a well-prepared border of moderately rich soil, it continues to throw up fresh growths, which, in their turn, end by branching into several one-sided racemes of bright primrose-yellow flowers, from 6 inches and upwards in length. The individual flowers are usually about half an inch over on the corolla lobes, at the base of the sinuses of which there is the characteristic purplish-brown spot, but which gradually fades out as the flower ages. The plant has thick fleshy roots, from which a crown of Plantain-like leaves are given off, generally about a foot long, stalkless and alternate, with their edges as well as the stems ciliated. Propagation is easily effected by division and root cuttings in the autumn, as well as by seeds, when they can be obtained, but it does not seem to ripen many seeds in this country; however, they are frequently to be had from continental sources. *F. R.*

PLANT PORTRAITS.

ALNUS MARITIMA, an American Alder, flowering in autumn on the wood formed in the spring. In the autumn, when covered with its large bright golden-coloured catkins, it has considerable beauty. *Garden and Forest*, June 10.

APPLE CALVILLE VICTOR HAGE, *Bulletin d'Arboriculture*, June. A seedling from Court pendu plat, but in appearance more like a Calville. It is prolific, and has obtained the suffrages of the pomologists of Ghent.

ERANTHUS BRACHYCENTRON, Regel, in *Gartenflora*, June 15, p. 324.

BEGONIA BAUMANNI, tuberous, with orbicular leaves, erect flower stalks, panicled flowers, each transversely oblong. *Gartenflora*, t. 1348.

BERTOLONIA GUTTATA VAR. *BARON ADOLPHE ROTHSCHILD*, *Illustration Horticole*, t. 130.—Leaves rosy-lilac, with deeper blotches of the same colour, speckled with pale circular spots.

BERTOLONIA GUTTATA VAR. *MADAME LEON SAY*, *Illustration Horticole*, t. 129.—A seedling of M. Bleu. The leaves have a cream-coloured ground flushed with rose, and symmetrically marked with transverse bands of narrow gyrate green markings.

BILBERGIA WITTACKIANA X, a cross between *amena* and *vittata*, *Gartenflora*, p. 329.

CATLEYA TRIANE, vars., *Le Jardin*, June 5.

CYPRIPEDIUM STONEI, *Lindenia*, June, t. 281.—Borneo. According to the results of a recent popular vote, this is the most highly esteemed of the genus.

CYPRIPEDIUM VILLOSUM, *Garden*, June 20.

HAMAMELIS ARBOREA, *Garden*, June 13.

HAMAMELIS JAPONICA.—*Garden and Forest*, June 3.

JASMINUM POLYANTHUM, *Revue Horticole*, p. 270.

LILIA PURPURATA, *Lindenia*, June, t. 282.—South Brazil. Introduced by M. F. Devos, in 1846.

LILIA PURPURATA VAR. *ALBA*, *Lindenia*, t. 283.—A variety with the segments white, while the lip is also mostly white, but traversed by a radiating purple line.

NECTARINE PRÉCOCE DE CRONCELS. "The largest earliest, and best Nectarine," according to the verdict of several of the leading French societies. A seedling from Amsden Peach, raised by M. Ernest Baltet. *Revue Horticole*, June 16.

REVENALA HILDEBRANDII, *Garden and Forest*, June 3.

TILLANDSIA LORENZIANA, *Gartenflora*, t. 1349.

ZYGOPETALUM GAUTIERI, *Lindenia*, t. 284.—Brazil.

NYMPHÆA LOTUS VAR. MONSTROSA.

The peculiarity of this variety, which was brought from Lake Nyassa by Sir John Kirk in 1886, lies in its production of tubers in place of flowers. During the season the plant produces a large number of buds, outwardly resembling those of an ordinary *Nymphaea*, but which never expand, and upon closer inspection they are found to be changed into tubers, which, upon maturity, become detached from the parent plant, and sink to the bottom of the tank, growing into plants with the character and habit of that of the parent.

Occasionally, and, I might add, rarely, does it produce normal flowers; in fact, it has only flowered four times, to my knowledge, since its introduction to this country—once at Kew, in the Lily-house, in 1887, and three times in the Lily-tank in these gardens, where the plants have been grown for Mr. Barber, who has studied and described the peculiarities of this species in the *Annals of Botany*, vol. iv., No. xiii., November, 1889; and readers who may desire more information respecting this plant, I would refer to this instructive paper. When in flower at Kew, it was determined by Professor Oliver to be a variety of *N. Lotus*, and which he distinguished from the other numerous varieties of that species by the name of *flore albo*; [of course Professor Oliver never intended these words to be used as a name! Ed.]; but it has been thought more fitting to adopt the name suggested by Mr. Watson, on account of the above-described peculiarity. It has some distant affinity with another well-known variety of *N. Lotus*, called *dentata*, the leaves having the same dentate margins as the above; the flowers are also white, and the chocolate markings upon the upper surface of the leaf are also present, but not in so marked a degree as the plant in question; when out of flower, the plant may be readily distinguished from the rest of the *Nymphaeas* by these markings.

The flowers are of a beautiful creamy-white upon first opening, between 4 to 4½ inches in diameter, while those of *N. Lotus dentata* are almost twice this measurement; the backs of the sepals have the longitudinal white striations interspersed with broader bands of green, which are peculiar to other varieties of this species; and from the general appearance of the plant, there can be little doubt as to its being a variety of *N. Lotus*. At the time of writing, the plant is in flower; it opens in the evening, at various times between 7:30 and 8 o'clock, and closes during the morning of next day, the flowers lasting about three days. *W. Harrow, Botanic Garden, Cambridge, June 15.*

THE APIARY.

TAKING OFF SECTIONS.

This pleasurable occupation now demands attention, as after the fine weather we have been getting, storing has been general. Care must be exercised, or the result will be cappings torn open by the bees, and sections totally spoilt in appearance. The use of a super clearer, as previously described in this column, simplifies the operation considerably; but there is an objection to this contrivance, as if section-racks are of different sizes, it necessitates one for each, making it an expensive luxury. Failing the latter, a good smoker must be depended on, well alight. Remove the quilt, and quickly smoke the bees down from each row of sections. The rack should then be covered with the carbolio cloth, and carried some distance from the hive, and the sections there taken out, brushing any remaining bees off each as removed with a feather. A hive-roof turned upside down can be used for brushing the bees into, so that any young ones (grey bees), unable to fly can be taken back to the alighting-board. The evening is a good time for the operation, as although some prefer to do it in the day, when many bees are out in the fields, it is a very warm job working in the sun

with a veil on. A piece of old sacking used for fuel for the smoker will keep alight longer than anything.

Self-Hivers.—The writer is now able to relate his experience with a self-hiver. Mr. Alley, an American beekeeper introduced the idea, and his system was to stand an empty hive by the side of the full one, the two entrances being connected by a tunnel or passage made of queen excluding zinc. A Mr. Bennett thought that an improvement on this plan would consist in placing the empty hive facing, with the tunnel leading straight from one entrance to the other, as he thought the queen would be more likely to go straight forward when the swarm poured forth than to take a turn at right angles. The writer adopted the latter idea, and on June 21 a swarm issued and settled on a tree close by. Finding that the queen did not join them they went back, but not into the receptacle placed ready for them. This was considered a failure, and an alteration decided on, which consisted in so arranging the latter that the bees had to pass through it to get in and out from their home, the queen excluder being placed over the outer entrance. The bees swarmed out again on the 24th, and returned and were afterwards found safely clustered in the desired place. Apparently, then, the best way would be to have a board with a groove 6 inches wide and ½ inch deep running through the centre on which to stand the empty skep. One end would then be placed at the entrance of the hive expected to swarm, and the other—which would be the new entrance—would be covered with the queen-excluding zinc. It might be advisable to use a skep with a feed-hole covered with ordinary perforated zinc, as the light might, perhaps, better cause the queen to ascend it, in the way of a drone-trap. *Expert.*

BROCKLESBY PARK.

LINCOLNSHIRE has not even yet quite lived down the evil reputation it unjustly gained. Many still think of it as a county of damp melancholy fens, with long lines of slimy ditches and still ponds of black water, and only relieved by scattered clumps of stunted trees. People who thus regard it, declare that land lighthouses are necessary to guide wayfarers through the sloughs of the trackless waste, probably founding their assertion on the supposed use Dunston Pillar was put to in the very old days. That all such statements are libellous, anyone, who knows Lincolnshire, will stoutly maintain. The county is now perfectly drained, and no more luxuriant pasture or corn land exists anywhere in the kingdom. Neither is it bereft of hills, for the long line of the wolds forms a purple background to nearly every prospect in the Lindsey division of the county. Despite the dykes, the air is dry and bracing, and a glance at a hydrographical map will show it to be one of the least rainy regions. Lincolnshire men, too, tillers of the soil though they mostly be, are yet among the best in the land. Was not the modern "Hub of the world," Boston in Massachusetts, settled from Lincolnshire? And were not Sir Isaac Newton, John Wesley, and Lord Tennyson all born and bred in the county? If anyone still doubts that Lincolnshire has natural beauty, let him hie to Brocklesby, Lord Yarborough's home, and see the grand woodland scenery there.

The Pelhams have been domiciled in their house in Lincolnshire ever since the days of the Plantagenets, and have always exemplified Wyclif's translation of a passage in Job, "the life of man is knighthood upon earth." For the last two hundred years they have been known as country gentlemen of the best type. On few estates have the same cordial relations existed for long generations between tenant and landlord. The magnificent castellated lodge was built by the tenants as a mark of gratitude, and a monument in the pleasure grounds is erected to a tenant "who in grateful respect bequeathed a legacy to his landlord." Members of the family, too, have played important parts in history. One, the Hon. George Pelham, is on the roll of the bishops of Lincoln. And what a famous roll it is! Among

the bishops of this see is Hugh, the sixth in order. He was one of the most saintly men that ever lived, and King John of England and William the Lion of Scotland helped to bear his bier. After him, came Robert Grosstete, the most learned man of his day, and a supporter of Simon de Montfort. Cardinal Beaufort and Wolsey held the bishopric for awhile, but both seem to have regarded it as a source of emolument rather than a cure of souls. Another well-known name is John Longland, who aided Henry VIII. so much in his divorce proceedings with Catharine of Arragon, that Storer even hints that the glory of the diocese was eclipsed under the Puritan and Calvinistic bishops that followed as a judgment from Heaven.

The first thought that strikes the visitor on entering Brocklesby Park through the aforesaid lodge, is "What a fine sporting estate." The surface is undulating, supporting rich pasture land, and stretching away to high Beech-woods on the one side, and on the other to belts and spinneys of younger trees. Scotch Firs, crowning the knolls, have a very pretty effect, and the Highland cattle, grazing round them, seem to love the shade which is kindly to them in summer and winter alike. A large sheet of water, with an island in the middle of it, overgrown with Willows, which in early spring were hung with golden catkins, gave an additional beauty to the peaceful scene. The park contains over 1000 acres, and the Beech-woods are so extensive, that one can drive for 12 miles without getting out of their shade. Finer Beech-woods, indeed, do not exist anywhere. Most of your readers have heard of the planting Duke of Athole. One of the Earls of Yarborough was no mean rival: for a tower in the woods, called Pelham's Tower, was erected when the then peer had planted 12½ millions of trees. The highest ground in the park, once the site of an ancient British tumulus, has been crowned with an elaborate building like a Greek temple, which is used as the family mausoleum. Forming a semicircle round this are some magnificent Cedars of Lebanon planted in 1794, when the mausoleum was built. They are among the finest specimens in the country, and are still in their heyday without any signs of old age. The prospect from the colonnade with the high Beech-woods of the park intersected with green glades in the foreground, and in the distance the Humber rolling seaward with majestic course is very lovely.

The grounds around the mansion are very tastefully laid out, and quite in keeping with the huge block of buildings. On the south side is a terrace-walk, 22 yards wide and fully 200 yards long, which has a very imposing appearance. Up to this broad walk spreads a far-reaching stretch of well-kept lawn, with magnificent forest-trees on either side, and here and there on its surface a clump of Rhododendrons or Laurels. Such a magnificent expanse of greensward is only to be seen in England. In fact, what strikes one most about the place is that it is so essentially English. The whole length of the walk is a line of standard Laurels, and under the high trees to the left are some masses of Dogwood, the crimson-tinted stems of which give a welcome glow of colour. It is curious that Dogwood is not more used for ornamental planting, nothing is so full of colour in the winter. On the west side of the house the trees come up closer to the fabric, and in front of a museum situated on this side are some tall gaunt old Cedars of Lebanon, and a magnificent *Pinus excelsa* 14½ feet in girth; and not far off is a picturesque Yew, spreading its lower branches, which have, in many cases, rooted again, over the lawn. A trim gravel path proceeds straight from the house, leading to some large copper Beeches, which also trail their lower branches on the ground; and an old-fashioned Rosery, where the Roses are trained in festoons and arches over iron wire-work. Opposite this are some prettily designed flower-beds. On the other two sides, trees with a dense growth of Laurels underneath, through which shady secluded walks wind girt the house. The hunting stables, for Brocklesby,

like Badminton, is one of the best known hunting centres, lie to the north, hidden by the high trees.

The visitor who has seen the pleasure grounds should on no account miss seeing the nursery. The path thither is by a grass walk, which is full of interest to the tree lover. At the beginning of it is a fine line of thriving Wellingtonias. Having walked by these, one emerges into a more open

planted out on the estate. Near the pretty cottage of the forester is an extensive pinetum. *Cryptomeria japonica* here makes a splendid specimen tree, as also do *Picea orientalis* and *Abies Lowii*. *Pinus insignis* and *P. excelsa* both thrive well; some of the trees of the latter apparently suffered some injury when young, and have grown up again from several stools. The effect is peculiar, but not

state of cultivation. The Vines are nearly one hundred years old, but still continue to produce Grapes of deep blue-black colour and luscious flavour; some enormous bunches of Muscat Hamburg being grown from the old Vines. The trees in the Peach-houses are being renewed, Humboldt Nectarine seems a great favourite with the energetic young gardener, Mr. Hobday—a good gardening

FIG. 4.—CENTAUREA MACROCEPHALA, HARDY PERENNIAL: FLOWER-HEADS YELLOW. (SEE P. 49, COL. C.)

space, where are some fine specimen Conifers, prominent being a tall Himalayan Spruce, and a wide-spreading *Pinus ponderosa*. *Abies pinsapo* and the *Araucarias* also find the soil to their liking. Next, the path leads through a dense mass of Laurels, which could not grow more luxuriantly in any place than they do here, and from which several huge Silver Firs tower up. The nursery itself contains a well-grown collection of young trees, destined to be

unpleasant to the sight. A great feature is the number of examples of *Juniperus fragrans*. No tree has such lovely Fern-like frondescence as this. It is a great pity it is not more frequently met with. *Picea pungens* and *Abies Hookeri* are two graceful trees, which bid fair to become valuable trees for planting. The soil, however, does not seem to suit the Douglas Firs.

There are 3 acres of kitchen garden under a high

name everybody will say. Asparagus is forced in large quantities by means of portable wooden frames. As in most gardens, there was a great slaughter of winter vegetables, Veitch's Model Broccoli being the only one that has showed any ability to resist the severe frosts. A very pretty part of this garden is the Rosery in front of the gardener's cottage. In the background is Brocklesby Church; planted near which are some notable trees, particularly a fine

Cryptomeria, and a Holly, which has grown up to a great height, with the habit of a Wellingtonia. The glory of the garden, however, is a grand *Salisburia adiantifolia*, which is without dispute almost without a rival in the country; it is nearly 60 feet high, and girths 6 feet at 3 feet up. I do not know if it has ever been figured, but it richly deserves to be so. *C. A. M. Carmichael.*

STRAWBERRIES.

ONE of our correspondents—a first-rate fruit-grower and judge of fruits—who, at our request, visited the Strawberry grounds of Messrs. Bunyard & Co., The Old Nurseries, Maidstone, *à propos* of the Strawberry Conference at Chiswick, sends us the following remarks for publication:—

A few days since, I had the pleasure of inspecting the collection of Strawberries here, consisting of something like ninety-two varieties.

"Surely you do not have a demand for all that number," I remarked, on hearing of the number grown. "Oh, no!" was the reply. "This plot which you see—about $1\frac{1}{2}$ acre—is devoted entirely to trials, where all varieties, from whatever source they may come, are grown side by side, so that a comparison can be made, and their several merits or demerits, as the case may be, determined." An excellent idea whereby one was enabled, at a glance, to see the habit and vigour of growth whether strong or weak; not that all the short growers were to be despised, for upon closer examination several of those which, viewed from a short distance, appear very weakly, proved upon closer examination to be really good in size of berry and flavour.

"There is a good strong grower," said my guide, and upon coming to the one pointed at, it proved to be Kitley's Goliath, and certainly it did not belie its name, as it was carrying a prodigious crop of fruit which was of excellent flavour.

Then almost side by side in competition were to be seen British Queen and Dr. Hogg, and in this particular instance the Dr. certainly was superior, but these being two such well-known and excellent sorts, growers would do well to plant them side by side, and decide for themselves which of the two suits their soil the better. Whichever is grown, it will need plenty of manure, and frequent renewals of the beds.

Harris's A 1 is a vigorous plant, and a good cropper, but it was not in condition at the time. Waterloo is a really good late variety, large, and of splendid colour. Then we come to the much-talked-of Noble, and if cropping qualities stand for much, then certainly it ought to be very much grown, although the flavour is about as poor as possible.

Commander is like a long President; it is of good flavour.

Trollope's Victoria is a pale-coloured, globular fruit. The plant is said to do well in smoky districts.

Auguste Nicaise is a strong grower, with large fruit, early, of good appearance, and good for pot-work.

Jubilee is likely to be a very valuable variety, it being one of the latest in bearing.

Countess has a short, sturdy growth; the flavour of the wedge-shaped fruits is good.

Newton Seedling is an excellent variety for preserving; it is an immense cropper.

Helen Gloede is very large, and excellent in flavour.

Carolina, as I saw it, is the greatest cropper of all; good for preserving. [Is this Carolina Superb, once thought so much of? ED.]

Aromatic is an excellent dessert fruit.

Alice Maude—wedge-shaped—resembles Keen's Seedling in flavour.

Aberdeen Favourite has sturdy growth, and is late and very distinct.

John Ruskin is said to be good for early forcing. It is a medium-sized, well-coloured, handsome

fruit. La Grosse Sucrée, in my opinion is one of the best all-round varieties for very early forcing. I have gathered fruits of it on Feb. 14 for several years past, and that without very hard forcing. It makes but few leaves, and consequently can be stood closer together than most others.

As a matter of course, Sir Charles Napier, President, and Sir J. Paxton were to be seen in large quantities; but being so well known it is superfluous to say more than—where they do well there are none to beat them as all-round varieties.

Many American Strawberries are being grown, but as they are, one and all, so poor in flavour, it is needless for me to say more, as that alone is sufficient to condemn them.

I might go on and describe many others, but the foregoing appeared to me to be the best. The firm will show a large quantity of sorts at the forthcoming Conference to be held at Chiswick. Several of the best alpine were carrying good crops; these plants are raised principally from seed.

I might add that there are several varieties which are supposed to be improvements upon Sir J. Paxton and President, but I was quite unable to detect any advance, but, on the other hand, they appeared not to be so good.

I think the thanks of the private gardeners will be due to Mr. Bunyard if eventually (which I know is his intention) he will bring his now very large collection down to something like eighteen or twenty-four varieties, and I think that number would cover all that are really worth growing.

BOOK NOTICE.

HOW TO GROW ONIONS. By Mr. J. A. Taplin. (London: Houlston & Sons, 7, Paternoster Buildings.)

THE above is the title of a pamphlet of twelve pages, designed to teach the art of growing exhibition Onions—those colossal bulbs so often seen at metropolitan and provincial shows. Why the author, who, by the way, is a good gardener, should say that his little work is written to show how "the true white Spanish Onion should be grown," we fail to understand, seeing that the treatment required by one variety is the same as one would apply to all others.

The directions are plainly given, and the most inexperienced person, if he follow them, ought to succeed as well as the best gardener. We must take exception to the extravagant use of cow-dung; a layer of this 6 inches thick laid over the already trenched land, and dug in to a depth of 3 inches, is "a little too thick," and amounts to a great many tons per acre; but as our author is merely writing about small Onion beds, it is not a very large quantity that would be employed.

Evidently Mr. Taplin is unaccustomed to editing, or we should have noted fewer errors in the small amount of letterpress comprised in the pamphlet.

FLORISTS' FLOWERS.

PAGE'S CHAMPION GREEN-EDGED AURICULA.

IN looking over some recent numbers of the *Gardeners' Chronicle*, I found a short note by my friend "R. D." upon this old variety, which was evidently considered a flower of considerable merit many years ago. It would, perhaps, ill become me to discourse upon the Auricula generally, but upon this variety in particular, a few moments, leisure afford me the pleasure of giving some references concerning it to "R. D." and others equally interested in it. To say when it was raised is not, so far as I am able, possible; but the date may certainly be put long previous to 1835, when it was figured in Smith's *Florists' Magazine*. This conclusion is arrived at by reference to that scarce

work, Emmerton's *Treatise on the Culture and Management of the Auricula, &c.*, for in the catalogue of varieties at the end of that book is an entry "Solomon Page's Champion." The edition quoted from is the 2nd, published in 1819, the 1st edition I have not, but it appeared four years previously. In Hogg's *Treatise on Florists' Flowers* (4th edition, 1823), Page's Champion also finds a place; and it may be found again as a coloured frontispiece to the pamphlet on the Auricula issued in 1843, as one of the separate numbers of Tyas's *Popular Flowers*. The *Florists' Journal* for 1843 also contains a mention of Page's Champion in the list of best green-edged Auriculas. *C. Harman Payne.*

BOOTH'S FREEDOM, LEIGH'S COLONEL TAYLOR, AND PAGE'S CHAMPION AURICULAS.

IT is interesting to Auricula growers to read the history of the best of the old Auriculas; the three best of the old green-edged varieties are, the one named at the head of this paper (and alluded to at p. 615, vol. ix.), Booth's Freedom, and Leigh's Colonel Taylor; the last-named is the best of the trio, and is still exhibited in good condition at uncertain intervals. The best truss of it seen recently was exhibited by me at the Royal Aquarium Exhibition last year, but I never knew a plant of it give a good truss a second time. I have before me a copy of the *Floricultural Cabinet* for the year 1833, in which it is stated, that this fine variety was exhibited some years previously by a Mr. Bailey, of the Clapton Nursery, "and in as fine flower as ever was exhibited perhaps, in England, and which he sold the same day to Mr. Brooks, of Ball's Pond Nursery, for the sum of five guineas;" but we are told the plant declined, and did not live to flower again.

Booth's Freedom I would place next to it, although it has angular paste, it possesses a beautiful green edge. This was placed at the head of the list of green-edged varieties sixty years ago, but it is now in a state of decadence, no grower being able to flower it in a presentable state. Mr. Simonite grows it better in smoky Sheffield than Mr. Horner can grow it in the pure air at Lowfields, or I can in Essex. We have both had plants more than once from Mr. Simonite, but can do nothing with it.

As for Page's Champion, I question whether anybody has it now. About fifteen years ago I had it from Mr. Horner, who grew and flowered it at that time; but except that it had a decided green edge, it had scarcely another quality to recommend it. The ground colour was a dull red, the edge very narrow, and the pips small. I had plants of it three or four times, but could not get it to grow under all the methods of culture I could think of.

Amongst the named Auriculas cultivated sixty years ago, was one grown under the name of Davey's Champion; it is shortly described as "black with a white edge." In the same paragraph in which this variety is described, there is also mention made of "a large sweet-scented double yellow Auricula," probably the same variety now in existence, and cultivated under the name of Yellow Prince. The green-edged class of Auriculas wants improving, but the work of raising new varieties in this class is very disappointing. I have now some hundreds of seedlings from the best green-edged varieties, and have flowered hundreds; but the only fair offer we have is the one certificated at most of the exhibitions under the name of Abbé Lizst. Mr. Simonite has produced a good green in Kev. F. D. Horner; and a seedling of Mr. Barlow's, grown and exhibited by Mr. Henwood under the name of Mrs. Henwood, promises well; but the truss had only three pips upon it, which is not enough to certificate a plant upon. *J. Douglas.*

VEGETABLES.

LETTUCES.

GENERALLY, gardeners sow Lettuces in beds, and transplant the seedlings, which answers very well early in the season, but not so at this time of year,

unless by chance the weather happens to be favourable for rapid establishment of the plants, and even then they never do so well as when sown where they are to grow and turn in. The why and wherefore of this is easy of explanation; plants that are pulled up must of necessity have their tap roots injured, and however carefully they may be moved, they are sure to receive some kind of check to growth, and this not only prevents them attaining to full size and hearting properly, but in the majority of cases, it causes them to bolt. To prevent this and to save labour, shallow drills or drills according to the number of Lettuce required should be drawn, and afforded a sprinkling of water, and after that has soaked in, the seed should be sown and covered about a quarter inch deep with fine dry soil. Managed in this way, evaporation of moisture, and the cracking of the soil is prevented, and the seeds germinate very quickly. As soon as the

nowned gardens. Situated, as they are, on the road to Trinity, there was nothing inviting in their external gateways even to a young aspirant for horticultural knowledge in those days, and there has been little, if any, alteration. The private door to the Curator's house, and the larger doors of entrance and exit, appear precisely the same. For at least a hundred yards along the roadway, this portion of Edinburgh, in so far as the houses are concerned, has not been touched. The Araucarias and the Deodars in the limited frontages show a departure from the bloom and vigour of youth, in their bare boles and struggling-for-life branches; but if we had been, so to speak, dropped from the clouds, we should have little difficulty in declaring our whereabouts, even after an intervening period of forty years. In the interior there have been considerable alterations. The deciduous and evergreen trees, which the late James McNab took so great a delight

the domestic chimneys, and the prodigal waste of power in coal combustion, which act against the purity of such an atmosphere as this portion of Midlothian ought to present. Even some of the deciduous trees are affected, and their lives crippled, with this smoke demon. Still, the garden was beautiful, even after a March wind, which was eating into the very vitals of everything tender in the way of growth. How grandly the hybrid Rhododendrons do, and how beautiful are the Aucuba leaves! The very Golden Queen Holly, although a little begrimed, showed what it would be on the return of growth. However, I am not concerned at this time in going into all the interesting arboricultural subjects which such a garden as Edinburgh presents. My object is more to have a running commentary on the "tit-bits" that struck my fancy.

The extent of the gardens now, including the Experimental Garden, which was a separate concern

FIG. 5.—GRAPES AT CUMBERLAND LODGE. (SEE P. 13.)

plants are up they should be thinned out, leaving the best and strongest at about 12 inches apart. A very good place for Lettuce at this season is on the ridges between the rows of Celery, where there is a great depth of soil; and they also do well on a north or half-shady border, as the full force of the sun is not favourable to growth in the Lettuce. For summer and autumn use the Cos kinds are the best, and the Paris White is as good as any, as it grows large, hearts in close, and is crisp, tender, and of good flavour. For sowing about the middle of August to stand the winter, none are equal to Hicks' Hardy Green and the White Seeded Bath Cos, which are first-class in spring. J. S.

SCOTLAND.

THE EDINBURGH BOTANIC GARDENS.

It is now quite forty years, all told, since the writer first entered the portals of these world-re-

in, and which he handled and turned over at all seasons of the year, like a master of the art, have grown, some of them, to goodly size; others are going down the hill. The pruned-in Deodars, which were a great hobby of his, still indicate where the knife has been at work; but the hand of Time has corrected the formality of severe pruning in some instances, and the plantations of them in the rising grounds assume as natural and as beautiful a feature as the Douglas Firs on the slopes of the embankment, where the railway runs through between Perth and Dankeld, in the Scone estate of Lord Mansfield. After all, severe amputation upon any arboreal subject, whether deciduous or evergreen, is not at all necessary. Correction is good, on the principle of training a tree up in the way it should go; more than that is questionable forestry practice.

Even Elinburgh Botanic Garden subjects have their troubles. You cannot draw your hand across the leaves of an Aucuba, a Holly, a Laurel, or a Rhododendron, without getting it blackened. The public works are not so numerous, but there are always

in the days I speak of, and the new ground that has been taken in on the east side for arboretum and other purposes, cover an area of about 53 acres. The botanical collection of plants has been removed to a bowling green-like paddock, and arranged in oblong strips set upon a grassy groundwork. There is a good deal of the cemetery appearance about this arrangement, but the advantages of it are obvious as a sort of object botanical text-book, class following class with precise regularity. There are in this paddock 2500 species all distinctly named, the difficulty seems to be to get a composition label that will stand all weathers and remain legible—nothing appears to equal the old wood label written upon in ink. The alpine arrangement has always been an interesting one, and these stone pockets which Mr. McNab had put down many years ago are now beginning to lose much of their formality. There are 2500 species in that undulating arrangement of pure alpine, and if we add the species of Ferns to this, the bulk will total something like 3000 species. These different collections give the 2000 studenta

that more or less dip into them with the eye of a botanist, a grand exploring field, second indeed to none anywhere I know. Of course all such important collections require a reserve paddock to draw from, as one tenderling goes after another, and the wonder is how the many different species can be perpetuated. The houses themselves are old, too old indeed for a national garden of this kind. The bulk of them I went through forty years ago, and although there is variety of feature and general cultivation on a scale corresponding with the times, some of the subjects merit better house room.

No. 1 house is a tropical Orchid house, in which some *Nepenthes* are suspended from the roof, and form capital fellow plants to all our East Indian *Dendrobium* and *Cypripediums* and *Cymbidiums* and such like. Some recent importations of *Dendrobium nobile* are very grand forms, large, brilliant, and in every way eclipsing the older types. The colouring is vivid, and the variations of labellum are so marked, as to point almost to the infusion of foreign blood. It is one of the most beautiful, as it certainly is one of the most lasting and useful of the whole *Dendrobium* race.

No. 2 house is filled with officinal plants, one superb plant of the Sugar Cane, with stems quite 20 feet long, had been found out by the rats, and these rodent pests having a taste for the saccharine matter within, bored into the canes and would have soon destroyed the ornamental appearance of the plant, but for the protection of a couple of cats which these vermin did not care to face, though they doubled past all sorts of poison baits. *Stangeria paradoxa* is a very distinct Cycadaceous plant, with fine glaucous-green pinnate leaves, and surmounted at the time of our visit with a male inflorescence, which is not unlike a cone of some of our larger *Piceas* with equally prominent scales.

No. 3 house had a distinguished example of the downy Sea-side Grape, *Coccoloba pubescens*, a plant in every way worthy of a second look but for the smell of Turkey Rhabarb about it. Another striking plant in this house, in every way suited for our warm stoves, was the scarlet-cymed *Brodiaea coccinea*.

No. 4 house is fitted with a collection of succulents, in which the larger *Euphorbias* and *Aloes*, and sundry other plants, fill up the lofty space around the back. Some of the plants are of great age, notably *Dacrydium cupressinum*, which, with its long drooping multiple branches, with the finest of leaflets, makes it a striking object in any botanical collection. The *Dammara australis* is also notable from its close fastigate habit, going up quite 50 feet towards the glass. The Wax Palm, *Ceroxylon aedicola*, lightens up the greenery of the group with its fine silvery-corded rachis.

No. 5 and 6 houses are full of miscellaneous plants, and such things as New Holland plants. *Acacia Riceana*, trained up the rafters, looks particularly well, and the inflorescence is just one mass, encouraged all the more by being shorn of a portion of its spraying-like branches. *Edwardsia grandiflora* is another striking object—indeed we note that it was figured in the *Botanical Magazine* in 1820 under the name of *Edwardsia Macnabiana*.

No. 7 is a house in which are a number of the useful hybrid sweet-scented *Rhododendrons*—some interesting crosses of the dwarf ciliare and *Edgworthii*, and in front are some of the rarer alpine, such as choice *Primulas*, and some *Saxifragas* as *Boydii*, *Burseriana*, and such-like gems. In an odd corner are some choice bits of filmy Ferns, nothing cooler or more sparkling with the water-drops attending its leaves than *Trichomanes reiforme*. In No. 8 house, at the end, is a good general assortment of *Gleichenias*; and among the flowering plants none more distinguished than *Banera rubioides*.

The great Palm-house stands alone. What a glorious assortment of the Palm family there is here, and in giant growth, too! The great *Seaforthias*, in tubs 9 by 5 feet, are a wonder in themselves. It makes one almost dizzy looking to their summits. Straight as a gun-barrel, up they go, as clean as the finest Malacca walking-cane that ever came from the Indies. The tiers of leaves have left their mark

every foot or so, but what a grand thing it is to see an endogenous tree of this kind of so gigantic a stature. Some couple have been spared, and sent to Kew, and we do not envy either the packers or the carriers of plants of such Titanic proportions as these. What renders them intensely interesting to naturalists is the immense bunches of fruit which they carry. The Grapes of Eschol were as nothing to these; and the 26-pounder that was shown at Edinburgh in 1865 was but a baby in appearance to these congregated clusters. *Livistonia chinensis* is equally distinguished—great stems, straight as a gun-barrel, and bearing beautiful leaves towards the extremity. *Sabal umbraculifera*, as a contrasting Palm to these named, is grand; its finely-cut palmate leaves, much divided with the yellowish sheen in the rachis, also loaded with fruit, is a sight worth going miles to see. These are but the giants in a house filled with selected subjects of the Palm family. One thing we noted, quantities of *Imantophyllum* (*Cliveia*) growing in pots set in the floor quite 80 feet from the light above, and shaded with dense frondage, all flowering as freely as if the plants had been rubbing leaves with the glass. Mr. Lindsay says, that this is the only plant that will flower in the Palm-house, and a full set of them is kept there throughout the year.

In the miscellaneous low houses there is much to engage and rivet the attention. The *Nepenthes*-house itself, although small, is full of the best of that race of plants; they are never permitted to raise their heads high; indeed, they seemed pruned to the quick, like an Apple espalier tree. In this way the pitchers keep their form distinct to themselves, as they ought to do, and they appear to get plenty of light. The *N. Dicksoniana* is now well known; it takes rank with the best of its compeers, and is clearly superior to that well-known and much-appreciated *Rafflesiana*; pity that *Rajah* is so bad to do. Mr. Lindsay's manipulation among this breed is well known, and he seems to be a most accomplished cross-breeder. It is a good thing that the pollen of any of this species carries well, and can be utilised after a few days' journey. In this way we may be able to get at the blood of some of the rarer ones that have been left in their East Indian Island's homes.

One thing is worth noting here, and that is how well *Ouvirandra fenestralis* grows. The secret of its growth is this: it is battened down into its water-hold in total darkness. In this way the *confervae* cannot enjoy themselves as they apparently do in light.

There is a fine collection of insectivorous plants here. Foremost among them, because of its rarity, is the South African *Drosera rotundifolia dentata*. This is the giant of a pigmy race, reaching quite thirty inches, in pyramidal-branched style, from the surface of the pot. Its rosette-looking leaves, in formal clusters up the stem, as glutinous as possible, command attention. This species has evidently been lost to the country, in others places the only two living plants being in the Edinburgh Botanic gardens. It is by far the best fly-catcher Mr. Lindsay has on the premises, and when it does catch them, there is no chance of their escape. Among other sorts is *Drosera auriculata*, which is the lowest of growers, with alternate leaves on a needle-looking stem; then there are *dichotoma*, *capensis*, and others, making up a striking looking group, in point of variety, stature, and feature.

It is quite a treat having an hour or two with an enthusiast among such a varied lot of plants as is under Mr. Lindsay's charge. Some we admire, and peer into; others we look at, and pass by. Truly, there are plants and flowers for all mankind, no matter whether they be clad in "hadden-grey" or "West of England broadcloth." *J. A.*

THE WEATHER IN THE NORTH OF SCOTLAND.

The trite saying that "Winter lingering chills the lap of spring," was well verified in the north this season. The cold, ungenial weather which pre-

vailed during March and April kept vegetation in complete check, and at the present time the growth is much later this year than last. Before the rain came the appearance of the country was extremely bleak, but a vast change is now to be noticed. The grass made marvellous progress, and the fields are clothed with a vivid green. *A.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

DENDROBIUMS.—These plants are in full growth, and any inattention in regard to heat and moisture will cause the new growth to finish up prematurely, and a new growth to break away at the base of the first, a matter always to be regretted, especially when the species is deciduous. Again, if sudden checks from any cause whatever are given the plants at this period, insects are very apt to follow them. The outside temperature here still remains low, the glass showing a minimum of 45° on three nights during the past week, which makes the use of fireheat for all divisions, with the exception of the cool house, a necessity.

CŒLOGYNE MASSANGIANA.—This is a beautiful Orchid for midsummer flowering. If the plants are large, they may be broken up, as a much better effect is afforded when several plants are hung here and there, rather than having one or two large specimens only, and one-half of the flowers are hidden from view. The plant is a good grower, so that no fear need be felt in thus dividing it. It does well in a compost consisting of two parts fibrous peat, one of good turf loam, and one of sphagnum moss, crocks, with some silver-sand. Baskets of Teak-wood, or earthenware pans, should be used, as the spikes of flowers lose their beauty in a great degree unless they are above the eye, the spike then showing all its flowers.

I grow the plants of *Cattleya Dowiana* and *C. aurea* with the *Dendrobiums*, these requiring the same degree of heat and moisture when growing; they should also be grown in baskets or pans, the latter being preferred, as the plants can readily be put into larger pans when necessary, and there are no ribs of wood to coil round, as in a basket.

Watering of the plants in every department should now have careful attention, and but few plants will need be kept dry at this part of the season; any plants that may come to hand, unless they come from very good sources, should be examined at the root, and unless the compost is clean and sweet, they should be turned out and repotted. I have known numbers of *Orchids* surface dressed for sale, and which the buyers lost, owing to the belief that no repotting was needed. *Thrips* are often introduced into houses by new purchases. It is good practice with a new plant to place it in the potting shed, and fumigate and sponge it to ensure cleanliness before putting it with the others.

ODONTOGLOSSUM ROEZLI is a plant that suffers severely if *thrips* be allowed to infest it, and as a remedy I practice dipping the plants in a solution of soft-soap and Fir-tree oil and water—about three-parts of the first to one of the second—once a fortnight; this keeps them away effectually. Should cool nights continue, the temperatures should be kept up by fire-heat. The minimum for the East India-house being 70°; *Cattleya*-house, 65°; Intermediate-house, 60°; and cool-house, 50°.—*A. G. Catt, Parkfield Gardens, Hallow, Worcester.*

THE HARDY FRUIT GARDEN.

VINES ON OPEN WALLS.—Train the young wood thinly, so that the sun may reach it. Fruit-bearing lateral-shoots should be stopped at one or two joints beyond the bunch, sub-laterals and tendrils stopped as fast as they appear, and all useless shoots removed. When a sufficient crop of fruit is set, reduce the number of bunches, and thin the berries, when of the size of Peas; leaders may be allowed to extend, but not much beyond the length to which it is intended to prune them back to in the autumn; but pinch out the tips when that point is reached. If the Vines are in a shallow well-made border, supply them with plenty of water, and occasionally sprinkle the soil with guano, or Thomson's Vine Manure. Elevated borders are

best for the Vines, and they should not be thickly coated with dung, as this shuts out sunbeats, of which they cannot have too much. Should mildew appear, dust affected parts with flowers-of-sulphur, and occasionally syringe the foliage with clean soft water up to the time when colouring shows in the fruit.

FIGS.—Thin out useless wood, and stop some of the shoots with fruits, others being laid in at full length, stopping being regulated according to growth. Wherever practicable, the Fig should not be much restricted, but allowed plenty of space to develop, the tree then being more fruitful. I may here mention, that the finest and heaviest crop of fruit which ever came under my notice was on trees which had at one time been trained to the wall, but afterwards left uncared for; this was at Fairlawn, Tonbridge. Should the roots be confined in narrow borders, do not let the trees suffer from want of water; and while heavily mulching of the roots is by some considered harmful, frequent doses of rich liquid may always be applied during growth, affording enough to moisten the soil throughout.

STRAWBERRIES.—These should be gathered daily when the berries are dry, the largest and finest with stalks for dessert, and the rest without, for preserving. Vicomtesse Héricart de Thury is a good preserving variety, for it is a sure and heavy cropper, and the colour of the fruits better than that of some others. The present is a good time for buyers of Strawberry plants to pay a visit to the nurseries, and take notes of the best varieties. *H. Markham, Mereworth Castle, Maidstone.*

PLANTS UNDER GLASS.

THE GREENHOUSE.—The early-flowering species and varieties of Epacris, which have been hardened off, after completing their growth, may be placed out-of-doors, on a bed of fine coal-ashes, care being taken to shade the pots from the sun's rays, and there should be some means of protecting the plants from heavy rains; an oiled canvas cover, stretched on a light frame of wood, answers well. The later flowering varieties, which have not finished their growth, should be kept indoors for a few weeks longer, that is, until growth is finished. *Dracophyllum gracile*, plants of which have been in flower for some time, and are now getting past their best, should have all the old flowers removed, and be encouraged to make fresh growth; the same holds good of *Aphelaxis macrantha* and its varieties. Great care is always necessary in affording water to these plants. Plants of *Polygalas* may now be cut back, and after they have commenced to break, they should be repotted into pots one or two sizes larger, keeping them close for a few weeks till fresh roots are formed. Care must be taken not to over-water these plants after repotting, until they have taken well to the fresh material, therefore they are best when placed under cover.

HEATHS.—Many species and varieties which have been flowering for some time should now have all dead flowers and seed-vessels cut off, and those which bloomed early in the season and have started well into growth, and which may stand in need of repotting, may now be attended to. In potting Heaths, make use of hard fibrous peat of the best quality, coarse and clean silver-sand, or broken sandstone and fine charcoal, and use clean pots, making the drainage perfect. Reduce slightly the old ball by picking away the outside with a sharp pointed stick, and if the old crocks are firmly embedded, leave them alone. The material should be rammed firmly round the old ball, so that the water cannot pass through it too freely, but well moisten the old ball in its passage through the mass. Keep the neck of the plant slightly elevated above the general level; do not cover the old ball with more than half an inch of new material, and leave ample space for water. Pot no plant when in a dry state. Newly-potted plants should be placed in a cold pit, and kept somewhat close for a few weeks, afterwards affording air freely. Water must be carefully afforded Heaths after repotting, and rain, or river water not running over chalk should be used, well water being often injurious. A sharp watch must be kept on the plants, and should mildew be detected, dust the affected parts with flowers-of-sulphur. Autumn-flowering varieties of Heaths, if placed out-of-doors, must not be allowed to suffer from want of water at the roots, or, on the contrary, from too much rain.

HERBACEOUS CALCEOLARIAS.—The present is a suitable time to sow seeds of this plant, as by so

doing, strong well-established plants are obtained before winter. Plants which are weak at the commencement of winter, remain weak so long as they live. Be careful not to sow the seeds thickly, as crowding in the seed-pans renders the plants liable to grow weakly from the first. Rich loam, leaf-mould, and silver-sand, passed through a fine sieve, makes a good compost in which to sow. *R. Milner, Penrice Castle, Swansea.*

FRUITS UNDER GLASS.

STRAWBERRIES.—I gave some directions in a previous Calendar as to the manner of dealing with these plants so as to secure early runners, and now the work of layering should be proceeded with. The recent showers have been favourable to growth, and there should be no difficulty in carrying out the work, beginning, first of all, with the earlier varieties, *La Grosse Sacrée*, *Vicomtesse Héricart de Thury*, and others. I like the last-named Strawberry which, although small, is prolific, very early, and of rich flavour, besides throwing its flower-spikes up above the foliage early in the year. The runners of these varieties may be layered direct into fruiting pots, small 32's or 60's, if for late fruiting, repotting them in this month; and I prefer the latter method, as I find they do best for late and mid-season forcing. As late forcers, *Keen's Seedling*, *President*, *Sir J. Paxton*, and *Sir C. Napier*, are not easily beaten, although if large fruits are looked for, *James Veitch* and *Auguste Nicaise* should be included. For late work in pots, *British Queen*, where it succeeds, is the best Strawberry grown; *Waterloo*, which I have grown this year, takes a long time to ripen, but is good for growing outside on a north border, and as it is the latest, it prolongs the Strawberry season considerably. To have well-matured crowns, it is necessary to pot the runners this month, and even the latest lot should not be left beyond the first week in August, so that the preparation of runners is an important matter when large fruits, and plenty of them, are desired.

MELONS.—Succession plants must have the lateral growth stopped, and be earthed up. Fruits will now be plentiful if seeds were sown at intervals of two or three weeks. Melons at this season bear fruit and ripen without much heat of an artificial kind, and those with scanty means at their command can obtain well-flavoured fruits from garden frames and other structures, the only drawback being damp. To avoid this, the plants should be planted on mounds brought up near the glass, and composed of good loam, mortar rubble, but no manure, the last-named being supplied in the form of liquid, or by top-dressing. In a close garden frame much rotted manure tends to cause canker, thus preventing the finishing of the fruits. To lessen the chances of having canker, air the frames freely early in the day, and employ the above compost. It is a good old plan to make a trellis of Hazel sticks or iron rods to support the bine, and bring the fruits close up to the light, besides keeping it clean and less liable to injury from slugs. The flavour of Melons grown in this way is better than when they are allowed to lay on the ground. Seeds may be sown up to the first week in August, but the plants will require to be grown in heated pits or houses. Some advise later sowings, but I do not, as fruits of poor flavour are of but little value. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

CARROTS.—A sowing of *Early Nantes* or other *Short Horn* variety may be made for drawing whilst young, and thus form a supply which will help to economise the main crops. A warm border, facing south or south-west, is a suitable place for this sowing, and where the beds may be protected from frost with lights or mats; if frames can be spared, these are better still, the lights not being wanted before cold weather has set in. The wireworm and the Carrot maggot are, in some soils, great foes to the Carrot; but these summer sowings are not so liable to their attacks as the earlier ones. As a preventive, the ground should be well dressed with soot and wood ashes, which should be well mixed with the soil or sown in the drills before the seed is sown.

PARSLEY.—Where a constant supply is required, a sowing should at once be made on a warm border, and in such a manner that it may be protected in winter with glass lights or mats stretched on hoops. To grow it really well with finely-curved leaves,

a deeply tilled rich moist soil is required. Parsley in some gardens is much injured by wireworms, and where this is the case, the ground should be well dressed with soot, and the plants watered occasionally at the roots with soapy water. When the plants are large enough they should be thinned to 6 or 8 inches apart in the rows, and kept free of weeds and encouraged to make rapid growth so that by the end of the summer a good yield of fine leaves may be secured, that will last until the spring, which it will do if properly protected in the cold weather. Plants sown may also be lifted at a later date, and planted on a warm border 8 to 10 inches apart, where protection may be given them during severe weather, but I give preference to sowings made now.

SPINACH.—A good breadth may now be sown for autumn use in drills 16 inches apart in well-tilled rich soil. Before sowing make the ground moderately firm, and rake it level before drawing the drills. When the plants are up, thin them to 3 inches apart at first, and afterwards to 6 inches. They may be a little crowded, but this is an advantage rather than otherwise, as frost and the black grub will now and then destroy some of them. Should this insect prove very troublesome, it is a good plan to make shallow furrows very near to the plants, taking care not to injure them, and pick up the grubs thus unearthed, depositing them safely in a jar for destruction. Birds will observe the disturbance of the soil, and search for the grubs.

CELERY.—The earliest planted-out Celery should have all suckers removed, and be kept well supplied with diluted manure water. If the Celery maggot has appeared, carefully pick off and burn all affected leaves, and frequently dress the plants with soot on dewy mornings. Keep the leaves upright by loosely tying them together with matting.

Finish the planting of *Kales*, *Chou de Burghley*, *Walcheren*, and *Autumn Giant Cauliflower*. *C. J. Waite, Glenhurst Gardens, Esher.*

THE FLOWER GARDEN.

SUB-TROPICAL BEDDERS.—These, consisting for the most part of seedling plants and of rapid growers, require to be kept uniformly moist at the roots, and they have made great progress during the last fortnight. Tall-growing plants which are liable to injury from wind, should be carefully tied from time to time to stout stakes, doing this in such a way as not to spoil the natural habits of the plants, bearing in mind that stakes and ties are used in the garden owing to necessity and not as ornaments, and therefore they should be kept as much as possible out of sight. A portion of such plants as *Abutilon*, *Acacia lophantha*, *Cannabis gigantea* (giant Hemp), *Grevillea robusta*, *Gunnera scabra*, and *Eucalyptus citriiflora* should have the points of the leading shoots pinched off with a view to develop compactness of growth and diversity of form.

GENERAL WORK.—This will consist in mowing and sweeping lawns, weeding and rolling the gravel walks, and hoeing them where they are made of shell or sea-sand; clipping grass verges, making secure the young shoots of climbers of every description on walls, rustic poles, Rose temples, and such-like structures, removing where opportunity permits of its being done old shoots to make room for young ones, and tying-in the shoots in such a manner as will avoid formality as much as possible, simply tying them in to cover space or prevent them being injured by the wind. The shoots where likely to get crowded should be thinned out, and not stopped. To the stopping of the shoots of climbers generally is due many, if not all, of the failures to flower these plants which are recorded from time to time; when the young shoots are stopped, lateral growths in plenty instead of flowers are produced. In tying plants, especially those that are fast growers, leave sufficient room in the ties for the shoots to grow without being restricted. Knowing from experience that this simple though necessary provision for the welfare of the plants is sometimes over-looked to the injury of the plants, I mention it here as a warning note. The picking off of blooms of carpet and bedding plants generally, the pinching and pegging out of shoots and the removal of weeds, and on Roses of over-blown blossoms, require daily attention. Plants in the reserve garden for taking the place of the summer-bedders in October must not be forgotten in the anxiety to produce a good summer effect in this department, and they must be kept free from weeds. *H. W. Ward, Lonford Castle.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

MONDAY, JULY 13—Eastbourne Horticultural Society.

SHOWS.

TUESDAY, JULY 14 { Wolverhampton and National Pink Society (three days).

WEDNESDAY, JULY 15—Ealing.

THURSDAY, JULY 18 { Hereford National Rose, Trentham, Holensburgh, Highgate, Ecton and Bedfordshire.

SATURDAY, JULY 18—Manchester Royal Botanic Rose.

SALES.

TUESDAY, JULY 14 { Orchids, at Protheroe & Morris' Rooms, Stove and Greenhouse Plants, at Leyton, by Protheroe & Morris.

FRIDAY, JULY 18 { Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

The Royal Horticultural Society. THE first of this year's Conferences in connection with exhibitions under the auspices of this Society, were held during the past week at Chiswick. On Tuesday the subjects treated of were "Hardy Summer Perennial Plants;" and on Wednesday, "Strawberries, Gooseberries, Raspberries, Currants, and other Small Fruits." On Tuesday the attendance would have been much larger, but for the unpropitious weather, rain falling in torrents the whole of the afternoon. There was a good show of hardy perennials, and a fair collection of Strawberries, but on the whole, it must be admitted, that this has been the least successful of the Chiswick conferences, and excited less interest among the fraternity. One very interesting exhibit consisted in the fruit-drying apparatus of Messrs. MAYFARTH & Co., which was shown at work, and afforded an excellent illustration of a cheap and speedy method of dealing with surplus fruit, and of preserving it for future use. Every fruit farmer should see this simple apparatus for himself. See also p. 53.

Steps should be taken to ensure a more interesting programme and a larger attendance at these conferences in future. The Conifer Congress in October offers a fine field, and, being at once of high practical, æsthetic and scientific importance, should be one of foremost interest. We trust our anticipations may be realised.

The Chairman (Mr. W. MARSHALL) in opening the proceedings on Tuesday, said the Council had arranged that the subject of that Conference should be "Hardy Summer Perennial Plants," a class of flowers which he thought had been, as a rule, overlooked by gardeners, and which had not received that attention to which they were justly entitled. He should be the last to decry any class of plants, but he thought it would be admitted that such plants as Orchids were luxuries for those who had a large balance at their banker's; in fact, they were the plants of the few. On the other hand, the flowers they had met that day to discuss were the flowers of the many, and for a reasonable outlay, a large collection could be got together, sufficient, if judiciously chosen, to last nearly the whole year round. They were, moreover, very good-tempered plants, and would put up with a great deal of ill-treatment. He was quite sure that if those who attended that meeting, and others which were to follow, could at the end honestly say they had learnt something, the Council would be more than repaid for the trouble they had been put to in connection with those Conferences.

WILD GARDENING IN MEADOW GRASS.

Mr. W. ROBINSON contributed a paper (which was read by the Rev. W. WILKS) on the subject of "Wild Gardening in Meadow Grass," in which the writer advocated what would practically be the conversion of our meadows into the semblance of those seen in Switzerland in early summer. This is to be effected by the wholesale planting of bulbs and other plants whose foliage dies down before the grass is ready to be cut.

Miss BROWNING HALL (Algiers), asked whether wire-worms would not eat the bulbs which were left in the ground year after year.

The chairman replied that there could be no doubt that they would do so; and Mr. CHARLES PEARSON said the best remedy for these pests was to spread broken Rapecake at the roots, which the wireworms would eat in preference to the plants.

The Rev. H. EWBANK then read a paper on the subject of the "Summer Flowers in my Garden," in which he sounded the praises of stately summer flowers like Eremurus, Fernla, Romneya, Lilies, &c. Alluding to the Oncocyclis group of Irises, which are particularly difficult to grow, the writer advocated the avoidance of manure, the thorough drying of the roots in July and August, and protecting them under a plate of glass. *Cianthus Dampieri* might be grown by grafting it on *C. puniceus*. The hardness of suckers, recently mentioned in our columns, was adverted to, and many hints given as the culture of "refractory" subjects, such as Mr. EWBANK delights in, and which he subdues by making himself acquainted with their manners and customs, and managing them accordingly. Mr. EWBANK'S paper, containing the experience of a persevering enthusiast, was full of valuable matter, but those who would succeed must be prepared to make the sacrifice of time, and use the patience and intelligence that he does.

PICTURESQUE HARDY SUMMER PERENNIAL PLANTS.

Miss JEKYLL (Munstead) contributed a paper, in which she dealt with hardy summer plants from the picturesque point of view. The paper was read by the Rev. W. WILKS; but before doing so, the Rev. W. WILKS said he would like to publicly express his own deep regret at the loss they had sustained in their friend, the Rev. A. RAWSON, and he was sure there were many present who joined with him in that deep regret. Mr. RAWSON was a most diligent student, and a most painstaking observer—points greatly to be desired in a horticulturist. They could always believe in any report he might send in about any peculiar growth or extraordinary find, and it never came into one's mind, in reference to him, as it would in the case of many others, to say, "Oh, he has probably made a mistake." They knew that Mr. RAWSON was such a wonderfully keen observer, that anything that came from him was the actual fact.

LABELS.

In the discussion which followed Miss JEKYLL'S paper, the Rev. W. WILKS, referring to that lady's statement that labels must be absolutely abolished from the pleasure-garden, remarked that Miss JEKYLL must have a most wonderful head to remember all the varieties in her garden when a visitor happened to say to her, "Oh, what is that? it is pretty!" He knew every flower in his own garden, but he could not name them at the moment, and if he were to abolish labels he was afraid he should soon get into an inextricable confusion. Speaking entirely for himself, his experience was that gardeners, as a rule, were not educated in the best grammar schools, and would, without the assistance of labels, give the most extraordinary names to flowers to any visitors who might call during the absence of the family. He strongly deprecated the removal of labels, which spoiled for themselves, and prevented the lover of flowers from getting a little bit mixed.

Dr. MASTERS said he should like to know the method pursued by Mr. H. EWBANK in the great label question. For his own part he had no difficulty at all in following Miss JEKYLL'S injunctions, as the labels abolished themselves in the most surprising manner.

The Rev. H. EWBANK said he could not at all agree with Miss JEKYLL in this matter. He looked upon gardening with a totally different object to that of Miss JEKYLL, who regarded it from the æsthetic point of view. In his own garden he used zinc labels and indelible ink, and he had found this the best method.

Miss BROWNING HALL (Algiers), spoke of a method of labelling in which a piece of zinc, 6 inches long and half an inch broad, was employed; this was bent into a circle, and the name of the flower was written on the inside.

Mr. GEORGE PAUL moved a hearty vote of thanks to the writers. He said he knew both Miss JEKYLL and Mr. EWBANK and their gardens, and he was quite sure that they carried their precepts into practice. All the writers were ardent cultivators of hardy plants, and enjoyed immensely the difficult task of making a plant grow when nobody else could. The climate of the Isle of Wight was undoubtedly in Mr. EWBANK'S favour, as when the same flowers were put into gardens nearer London, they disappeared, and Mr. EWBANK had to be asked for a fresh supply. With reference to labels, it was a fact that many people

FIG. 6.—CLIVEDEN, NEAR MAIDENHEAD, A SEAT OF THE DUKE OF WESTMINSTER. (SEE P. 46).

disliked them, as in numerous cases the labels were more conspicuous than the flowers.

Mr. PEARSON (Chilwell) seconded the motion, which was carried unanimously, and the first day's Conference terminated.

ROYAL HORTICULTURAL SOCIETY.

The second day's Conference on Strawberries, Raspberries, Currants, &c., was held under the presidency of Mr. G. BUNYARD. The attendance was about the same as on the previous day.

The Chairman, in opening the proceedings, expressed the hope that the Conference would be the means of spreading a large amount of information about what were technically called "small fruits." The importance of the Conference was perhaps greater than appeared on the surface, because the whole of the subjects to be discussed required only ordinary treatment, and needed no very great horticultural skill, and the fruit supplied a vast amount of jam, in which form it reached homes where it would not be procurable in any other way.

STRAWBERRIES IN THE PRIVATE GARDEN FROM JUNE TO OCTOBER.

Mr. ALLEN's paper on this subject was read by Mr. A. H. PEARSON.

GOOSEBERRIES FOR PRIVATE GARDENS.

Mr. D. THOMSON (Drumlanrig, N.B.), contributed a paper on "Gooseberries for Private Gardens," which was read by Mr. WEATHERS, the Secretary.

RASPBERRIES.

Mr. WYTHES read his paper on "Raspberries."

Mr. NORMAN was not present to read his paper, which the Chairman said would duly appear in the *Journal*; and Mr. CHARLES LEICESTER was unable, through illness, to read his paper on "Gooseberries for Exhibition."

The Chairman invited questions and discussion, and said it appeared that the papers were so excellent as to leave no loophole. He would, however, like to make a few remarks. He thought they ought to get more upright Gooseberries, as many of the best Gooseberries crept on the ground in a most unfortunate way, so that every shower spoilt them just at the time they were most wanted. Then, again, large Gooseberries were deficient in flavour, and were like Melons, which had to be cut at a particular time, in order to get the flavour at its highest point. They ought to have more late ones, and more early ones; and to show the value of getting an early Gooseberry, even if the quality was not much, for market purposes, a grower in Kent had found a Gooseberry (which might possibly be identified at some future time), which produced at from ten days to a fortnight before any other. The consequence was, that he got £120 an acre for them as green ones. As far as flavour went, he thought he might mention Cheshire Lass, Green Gascoyne, White and Red Champion, Ironmonger, Warrington—these represent the very best flavours. Then as to size, there were the Bobby, Antagonist, among the reds; the Ringer and Drill, among the yellows; and the Stockwell and Telegraph, among the greens. That was a series of Gooseberries of which anybody could make a great deal. Then there was not sufficient enterprise in getting Gooseberries in early positions on walls. In that case the berries came just a little before any others, and in gardening that was a very great point. He had had a Gooseberry-house made, which had been much admired. It consisted of wire archways, covered with wire netting, and was found to be most

useful in keeping off birds. He would also commend the culture of the Gooseberry in the form of cordons. In that form the two branches would take up very little room, and then would produce same splendid fruit. With regard to manuring, he had found that the most successful plan to be, to manure in the autumn, and prune through the winter. After that, the manure was dug-in in the spring as soon as the first crop was taken off; the trees were then thinned out and heavily manured again. This brought on a second crop, and enabled the plant to bear year by year without losing its vitality. He thought there was a field for white Raspberries, and that it was possible, in the course of time, to get a white Raspberry of a very much larger size, and of a different race, to that which they obtained at the present moment. Autumn Raspberries were well worth growing. The yellow one was at present the best flavoured. As to Currants, they should strive for longer bunches and larger berries, and to get longer bunches, the present sorts might be crossed by the Reine Victoria; but in the way of Currants they seemed to have reached almost the utmost limit—it was only a matter of cultivation. In black Currants, a very important thing was to get early leafage to protect the fruit, as on Whit Sunday last the frost was so severe as to almost annihilate the crop. They still wanted late Strawberries of the British Queen flavour, and he entirely agreed with Mr. ALLAN that for the early ones they ought to be cultivated on the one year's system which might save at least a week or ten days. The Waterloo was a very good fruit, but it lacked flavour, and if it could be got with the Queen-flavour it would be very much appreciated. They all should have strong foliage. Dr. Hogg was the best fruit of all, and the President was the next best for general purposes, and in them they had very good parents with which to work. Of course, it would not be done in a minute. These things had been brought to such a pitch that they could only expect to go on step by step till they got what they desired.

There were many other fruits which could be discussed, such as the Cranberry, the Mulberry, and the Bilberry, which would make a welcome change, but these could be dealt with on another occasion.

Mr. LAXTON did not agree with the Chairman that the upright growth was any protection from frost, and he advocated the curved growth.

Mr. PEARSON supported the Chairman's views, and said that nineteen times out of twenty he had a full crop from upright Champions. He was glad the Chairman had referred to the pruning of Gooseberries. He was afraid that a great many amateurs, and, he might say, some professionals, looked upon pruning as hardly worth their attention. On the other hand, some people went to the other extreme, and he had seen a gardener clipping a Gooseberry tree with a pair of shears, so as to get a nice shape!

Mr. LAXTON said that many years ago he knew of some Gooseberry trees which were then seventy years old. They had never been pruned, but they always bore a crop of fruit. If a crop of fruit was wanted, very little pruning should be done.

This closed the discussion, and on the motion of Mr. P. CROWLEY, seconded by Mr. PEARSON, a hearty vote of thanks was accorded to the writers of the papers.

CLIVEDEN.—A more charming honeymoon-retreat than that placed at the disposal of Prince ARNOLD of ANHALT and his bride, or a more characteristic bit of English scenery to be seen of our

German guests, can hardly be imagined than Cliveden. Situated on the chalk, its wooded cliffs overlook the windings of the Thames (fig. 6), and gnarled trees, contorted roots, dense many-hued foliage, and spacious swards, lend their charms to a scene that for quiet beauty can scarcely be equalled.

THE GARDENERS' ORPHAN FUND AND THE FETE AT THE CRYSTAL PALACE.—Mr. G. W. CUMMINS, The Grange, Carshalton, sends us the following:—"At the last meeting of the Croydon Gardeners' and Amateurs' Mutual Improvement Society, the members decided to have an "outing," and they have determined to visit the Crystal Palace on Wednesday the 15th inst., on the occasion of the fête in aid of the Gardeners' Orphan Fund. It is expected that the members will render all the support they possibly can; and as Mr. STANLEY BAXTER, the honorary secretary, does not believe in doing things by halves, and as the society has undertaken the matter, he will see that the affair is well carried out. The following gentlemen have been elected to assist him in the disposal of tickets: Mr. T. Butcher, South Norwood and Croydon; Mr. J. R. Box, West Croydon; Mr. G. W. Cummins, The Grange, Carshalton; Mr. W. Carr, Croydon Lodge; Mr. G. H. Cooper, 148, Sydenham Road, Croydon; Mr. F. C. Frost, Vale Cottage, Old Town, Croydon; Mr. J. Newbury, 183, Whitehorse Road; Mr. A. C. Roffey, Church Road. Mr. Baxter's address is 40, Woodside Road, Woodside, S.E. It is hoped that other societies will assist in making the Rose Fête and Floral Fête a success.

THE ROYAL WESTERN HORTICULTURAL SOCIETY'S SHOW, says the *Western Mercury*, promises to be highly successful. The exhibition will take place in the Guildhall on July 21 and 22. Entries close on July 14.

THE FRUIT CROPS IN KENT.—The annual sales of Cherries in Kent demonstrate more than anything else the scarcity of soft fruit this season. At a large sale near Sittingbourne recently, an orchard containing 100 acres of Cherries failed to secure a single bid, whereas in former seasons the fruit on the same plantation has been known to realise £1200.

THE MARTIN SMITH PRIZES FOR BORDER CARNATIONS.—Mr. MARTIN SMITH has, on the suggestion of Mr. HARRY TURNER, authorised the publication of the following:—"Each stem to carry not less than three blooms or buds." It is felt that it is impossible to prevent disbudding, especially as the act of removal cannot be detected, even supposing the practice to be disallowed. There is nothing in the regulations governing the competition for these prizes which prohibits disbudding. The prizes will be competed for at the Drill Hall, James Street, Westminster, on July 21.

NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL PICNIC.—The annual picnic will, by the kind permission of LEOPOLD DE ROTHSCHILD, Esq., one of the Vice-Presidents of the Society, take the form of a visit, on Monday, July 20, to his seat, Ascott Park, Leighton Buzzard. The gardens and grounds will be open to inspection, together with the breeding-stables and kennels. In addition, Mr. L. DE ROTHSCHILD has promised to provide tea for the visitors. The cost, inclusive of railway fare from Easton, Kensington, Addison Road, Camden Town, and Willesden, dinner at Leighton Buzzard, and conveyances from Leighton Station to Ascott and back, will be 7s. 6d. each. Ladies are specially invited. Those who intend to be of the party, should communicate with Mr. R. DEAN, Ranelagh Road, Ealing.

EALING ROSE SHOW.—Mr. R. DEAN writes to us as follows:—"The exhibition of the Ealing Horticultural Society takes place on Wednesday July 15. To avoid misunderstanding, I may mention that the classes for Roses, formerly open to all comers, no longer find a place in the schedule of prizes; and prizes for Roses can be competed for only by resi-

dents in the parish of Ealing. Because the Ealing Horticultural Society is affiliated to the National Rose Society, their fixture finds a place in the list issued by the National Rose Society, though open classes no longer exist in the schedule."

THE ROYAL HORTICULTURAL SOCIETY'S SUMMER SHOW.—This show was held on the afternoon of July 2, in Lord IVEAGH'S grounds, at the rear of his Stephen's Green residence. So far as the programme was concerned, there were elements of success. Mr. HAMILTON DRUMMOND'S Cup, for the best stand of cut blooms, was won by Mrs. TEDCASTLE, of Marlay, Rathfarnham. There was rather a poor show of fruit, generally speaking, but the Grapes were good. The Society's Silver Medal, for a stand of six bunches of Grapes, was won by Mr. J. G. NUTTING.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—At a meeting of the council of the above institution on the 7th inst., a cheque for £421 10s. 3d. was received from Mr. GARRETT TAYLOR, of Norwich, being the proceeds up to date of the fund raised to perpetuate the name of the late Mr. ROBERT LEEDS in connection with an institution, of which he was for many years an active and zealous supporter.

PRESTON AND FULWOOD FLORAL AND HORTICULTURAL SOCIETY.—The annual meeting of the members was held on Saturday, the 4th inst., at the Legs of Man Hotel, Mr. SAMUEL H. STOTT, of Fulwood, presiding. The annual report and balance-sheet, submitted by Mr. JNO. ATTERTON, the Secie-

The Rev. H. HONWOOD D'OMBRAIN, Westwell Vicarage, Ashford, Kent, is the Secretary.

MR. SPENCER MOORE.—We learn from the *Journal of Botany* that this gentleman has been appointed Botanist to the Matto Grosso Gold Expedition, whose head-quarters are at Cayaba. We trust so good a botanist will find the opportunity to greatly develop our knowledge of the Flora of this district.

REWARD OF MERIT.—At a Court of the Fruiterers' Company, held on June 25, Mr. SAMUEL BARLOW, J.P., Stakehill House, Manchester, was, in consideration of important services rendered to the cultivation of hardy fruits in this country, elected a member of the Guild.

POTATO DISEASE.

In our last issue we alluded to the influence of sulphate of copper, lime, and sulphur in controlling this disease. We have repeatedly given formulas and directions for the preparation of the Bordeaux mixture and similar compounds, but as their preparation is somewhat troublesome to the gardener, he will find it useful to employ such a mixture as Tait's Anti-Blight, which is a fine dry powder, by means of a pair of bellows, as in fig. 7, or of an indiarubber distributor. It is both unscientific and unpractical to recommend remedies of unknown composition; indeed, this is a piece of quackery which no respectable journal would sanction in its editorial columns, but in this case the composition

FIG. 7.—THE MALBECK BELLOWS DISTRIBUTOR.

tary, were adopted as satisfactory, and the officers and members of course were re-elected. A discussion took place in reference to an insect which had made its appearance locally and destroyed a number of Roses, and it was decided to submit specimens to well known scientists. A few persons sent exhibits.

THE EVENING FETE AT THE BOTANIC.—In spite of more than doubtful weather, and many other distractions and attractions, this function passed off successfully last Wednesday night, when the grounds and tents were decorated as prettily as usual by Messrs. Z. D. BERRY & SON and Messrs. BENEFINK. Visitors were more numerous than one would have expected. Table decorations formed the principal feature of the show, and the principal awards went to Messrs. BENEFINK, OSLER, and CHARD.

HORTICULTURAL CLUB, HOTEL WINDSOR, VICTORIA STREET, S.W.—It has been arranged to have an excursion (to which ladies are invited), on Wednesday, July 29, of which the following is the programme:—Members and their friends will assemble at the London Bridge Terminus (First-class Waiting Room) of the L. B. & S. C. Railway at 9 15 A.M., thence proceed in special carriage to Three Bridges, where brakes will meet them. A short visit will be paid to Messrs. CHEAL & SONS Nursery, at Lowfield, then a drive will be taken to North Park (Mrs. MONTEFIORE'S) from thence through Tilgate Forest to Handcross Park (Mr. WARREN'S), returning through St. Leonard's Forest to Crawley, dining at the George Hotel, at 7 o'clock, returning to at London 9.22 P.M., reaching London Bridge at 10.33 P.M. The price of the ticket: Railway fare, carriages, lunch, dinner and wine, will be 18s. 6d.

has been made known to us, and we have, therefore, no hesitation in saying that it is well suited for its purpose. Unfortunately, there seems too much reason to fear that there will be ample opportunity for testing its virtues. In the meantime, we refer to the figure at p. 437 of our last volume to show what copper sulphate will do in preventing the ravages of the disease. We are glad that the Irish Land Commission have issued a coloured sheet for hanging up in schools and farms, showing the appearance of the disease in various stages, and containing hints for growers which ought to do some good in preventing them from propagating the disease, as they now do. These hints are neither so imperative nor so explicit as they might be, and the use of copper sulphate is spoken of too much in the potential mood. It is so difficult to get anybody to do anything at all, that mild exhortations are worthless. Nevertheless, agriculturists owe their thanks to Mr. Carruthers, under whose superintendence the diagrams and the directions have been drawn up.

HOME CORRESPONDENCE.

THE WEATHER AND THE CROPS.—In my last remarks on the weather and fruit crop, I promised to give more particulars later on. Now I may state the frost has thinned the fruit crop to a great extent. Gooseberries are still dropping from the effects of the borer; in some places there is a fair crop, others calculate on getting about half a crop. Black and red Currants about the same, but the bunches are very much thinned. Apples and Pears will be a light crop; of some kinds, the ground is strewn

with the fallen fruits. Plums are a very heavy crop as regards some kinds; and Damsons show for a full crop, the branches are already bending with the weight of the fruit. I hear of some who have formed contracts thus early, at a low price. Cherries are very thin; Nuts promising and clean; Apricots, Peaches, and Nectarines a heavy crop. Fig trees were nearly killed by frost, but they are just breaking into leaf; but there cannot be much fruit. Raspberries and Strawberries are not injured. We began to gather the latter on June 16. Potatoes that were cut have grown well. We have been lifting from south borders for about a fortnight. Peas that were in full bloom were not hurt—began picking on June 10. Last week we had to water Strawberries and Peas again, the thermometer, standing in the shade, marked 70°, and 72° on June 17, 18, 19, and 20. Several hours' nice rain fell on June 22 and 23, and it was much wanted. It was again a very warm day on June 24, the thermometer, in the shade, standing at 72°, and on June 25, 74°. Temperature very regular for some days past, with fine growing weather, everything progressing. Strawberries coming in fast, and of fine size. *W. Divers, Weirton, Maidstone, June 29.*

FOXGLOVES.—You truly observed in your Answers to Correspondents last week, that "the union of several flowers is a common occurrence in Digitalis." When at Reading a few days ago, I saw in Messrs. Sutton & Sons' seed-shop what seemed to be a very unusual development. A spike of a rosy-coloured Foxglove, having a number of small spots on the throat, had produced one flower in which the corolla had become considerably enlarged, and taken the form of the Canterbury Bell, and it looked as if a flower of *Campanula Medium* had been fastened on to the spike. The colour and spotting remained the same; but the transformation was singular in the extreme, as, with the exception of the colour, all the usual form of the Foxglove had disappeared, and given place to a distinctly formed and exact Canterbury Bell. *R. D.*

THE FRUIT CROP.—It is very disappointing and lamentable, after all the promise, to see how seriously the fruit crop has been thinned, as, excepting here and there, Apples that appeared set and swelling have ceased to progress, and are fast falling from the trees, the leaves of which look anything but healthy and well. Pears seem to have held their own better, but though they have not shed their fruit in the way Apples have, much of it is frost-bitten, and, as a consequence, pinched and deformed, the result of which will show itself later on, when the Pears will become gouty and hard in the flesh. Cherries are almost a failure, as, instead of swelling and ripening, very few will reach that stage, they having turned yellow and shrivelled. Strawberries, too, are very unsatisfactory, as the fruit looks baked, the cold and aridity of the air having been more than it can bear, followed, as the ungenial weather has been, with hot gleams of sun. There will be a few Plums on walls, but hardly any on bushes and standards, except where the trees are very sheltered, and had a good set. Gooseberries and Currants are plentiful, and so are aphids, for, as is usual in bad seasons when growth is slow, these insects have every chance of establishing themselves, as they cause the leaves to curl, and so cripple the shoots. The damage they do does not end in the mischief wrought this season, but extends to the next, and therefore every effort should be made to rid the trees of them, one of the safest remedies being Quassia steeped in hot water, and 2 oz. of soft soap added to every gallon of liquid. This syringed on and followed by a heavy washing from the garden engine, will dislodge the aphid and set the trees free. *J. S., Ipswich.*

THE STRAWBERRY CROP.—The general report in my district concerning the present crop of Strawberries is, that whilst fruits are very abundant they are not so fine as in some previous years. This result has been attributed to many assumed causes: the intense severity of the winter weather, which seemed to destroy every leaf on the breadths; the long cold, dull, spring; and the comparative dryness of the soil. If it be admitted that all these things conjoined have tended to make Strawberry fruits smaller than usual, probably the suggestions will not be far wrong. I am rather disposed, however, to place most emphasis upon the latter cause, because the soil is still, in spite of some recent excellent rains, very dry some few inches down. To tell the truth, we have had a wonderfully dry winter and

spring, and that almost luxuriant moistening the plants had last summer has been greatly wanting this year. Strawberry plants are, on the whole, rather gross feeders, and need plenty of moisture. If plants were now dug up, very great would be the surprise at the comparative dryness of the soil beneath, and yet we had the best rains only since the fruits began to form, so that they came too late to furnish that force and stamina necessary to the formation of fine blooms and fruits. Then again, the exceeding abundance of the fruits set militates somewhat against the production of size. Could outside plants be subjected to the same thinning process accorded to pot-plants under glass, the evil might be somewhat remedied, but that is out of the question. Plants in pots under good culture almost invariably produce fine fruits, because they can have plenty of warmth, moisture, and if need be feeding; and also have the fruits duly thinned. What failures occur in Strawberry forcing, and after all they are many, are chiefly due to imperfect cultivation. No doubt many Strawberry growers plead that it is impossible to secure good sets when the skies are leaden, the atmosphere thick with smoky vapour, and light is wanting; these are, however, defects more local than general, and the wonderful success of some growers, notably those of Mr. Norman at Hatfield with Sir Charles Napier, shows that, after all, the production of fine fruits of Strawberries under glass depends more upon skill and knowledge than to any other cause. It was recently remarked by a non-professional visitor to the Kentish Strawberry fields, that many of the fruits were of very irregular form, and it was concluded that imperfect fertilisation of the blooms was the cause. The blame was laid upon the poor bees as usual, but nothing is easier than to argue from false premises, because plenty of fruits of the finest form are found on forced plants, to which no bees or insects of any fertilising force gain access. Imperfect form in Strawberries is more often due to defects of cultivation, or of surroundings, such as coldness, absence of light, want of moisture at the roots, &c., than to lack of insect agency. It would be idle to assume that one tithe of the Strawberry blooms of the country are insect-fertilised. Nature has for certain furnished plants with the needful fertilising powers, and whilst insects for the preservation of their fugitive lives have been plucking the sweets, we have been only too ready to build up illusive theories, crediting them with labours by no means correctly. A piece of Turnip which has seeded wonderfully well, was, when in bloom, devoid of all insects, so far as I could detect on frequent observation, and generally I have never known bees to be more scarce than this year. It is clear that to what new causes may be due fine fruits or small fruits, handsome ones or imperfect ones, we must look to excellence or errors in cultivation, rather than to other causes. *A. D.*

AZALEA MOLLISS—This variety of Azalea is fast rising in public favour, and no wonder, as its flowers are much larger than the old Ghent kinds, and the colours more varied. It is also remarkably free-blooming, plants of quite small size setting flower-buds at the end of almost every shoot, which with but little forcing, open freely, and make a grand show in the greenhouse in winter and spring. Unfortunately the flowers have no scent, but that will, most likely, be remedied in the new varieties raised, as, no doubt, they will cross with the Ghent sorts, and partake of their perfume, those of a yellow colour being deliciously sweet and fragrant, in which respect they almost rival the Honeysuckle. Not only is the Azalea mollis valuable for pots to grow or pot up for forcing, to afford cut bloom or embellish the conservatory, but it is of great use to form groups, either by themselves, or to plant in the front of Rhododendrons, with which they associate well. As to soil, that need be no bar to their culture, for peat is not essential or required, as they do just as well in sandy loam, and may be planted almost anywhere with every chance of success. The way to increase them is to plant low, and then they root all around the stems or crown, and may be divided, and they seed freely; but as they can be bought so cheaply, of fair size, few will care to go to much trouble to raise them. *J. Sheppard.*

LETTUCES.—We have had a trying season for Lettuces and other salad plants, nearly all winter varieties being killed by frost; and the spring with its cold weather was very unfavourable for the young plants, spring sown or planted out. I have grown them in a variety of ways, and managed to keep the supply equal to the demand. The varieties which

were chiefly planted were Veitch's Selected Brown and Paris Market, Cos. All the Year Round and Neapolitan Cabbage varieties. Last autumn I put out about 2000 plants at the foot of the garden wall, where, in an ordinary winter, they are quite safe; but this season all were lost but about 300, and these against the wall facing south, and upon higher ground than the rest, and produced good heads. From a sowing made in September, a dozen frame lights were filled, putting the plants close together. These were gently forced by means of a lying of dung and leaves put round the pit which afforded sufficient warmth to keep them moving, and from them a good supply was obtained from February onwards. A late batch of Endive was treated in a similar way, and with good results, as it lasted till the middle of the month of May. Seed was sown in a box about once a fortnight from January 1, and put into a forcing-house, and as soon as the plants were large enough the vacant spaces in the pit were filled up with them, which afforded us plenty of nice young stuff. I also sowed Lettuce seeds along the back border of the vineries when the Vines were started, and from these sowings a number of useful plants were got. From All the Year Round, Neapolitan, Golden Queen (Veitch), raised in heat, and nursed in shallow boxes, and planted outside in the first week of April, some excellent heads have been cut. Daniels' Continuity appears to be a hardy variety, but its colour is against it; but that is a secondary consideration, if it will stand the inclemencies of our winters. Of Cos varieties, and their name is legion, Sutton's Mammoth White, White Heart, Paris White, Veitch's Selected Bath Cos, Hicks' Hardy Cos, and Ivery's Nonsuch are all good. If seed be sown once a fortnight in rows, thinly, and if too many appear, pricking them out into beds, those which remain will be fit for use for a longer period than transplanted ones. *W. A. Cook, Compton Bassett.*

SOWING PEAS.—Pisum, writing in last week's *Gardeners' Chronicle*, p. 18, headed "The Seed Trade," says that the old practice of sowing Peas in the open during the month of November is now largely abandoned. Well, we often hear of failures, and I remember reading in these pages something in the same strain, a few months back, by Mr. J. Douglas, but my experience is this: In January, 1868, I went to Somersetshire as foreman in a neat well-kept garden, the head gardener taking charge the same day as I went down, and I well remember that his greatest trouble was that no Peas had been sown—and he lost no time in getting some Peas in. From this sowing he gathered Peas, fit for table, on June 2. He sowed the first week of the following December, and gathered on May 18, and he sows, I think, to this day about that date. I remained there three and a half years, and have been a head gardener ever since I left it, residing in three different counties, and I always sow my earliest Peas, if possible, in the first week in December, and I have sometimes gathered Peas, fit for table, as early as May 16. I sow Dilstone's Early or Sutton's Ring-leader, sometimes both; William I. does not do so well. *A. Douglas.*

EARLY TOMATOS—It must be puzzling among the multitude of varieties for an amateur to know which to select, as all are good though some better than others. I have this season grown more varieties than usual, so as to get to know which is the earliest Tomato. This I have proved to be that prolific variety "Orangefield," which comes into use just one week earlier than Nesbitt's Victoria, a small cluster Tomato, of rich flavour. Neither of these is the best variety for every purpose, but when earliness is the chief object of the garden, they are worth growing. Ham Green, Hackwood Park, Sutton's and Veitch's Perfection come in about together; and Dedham Favourite, Golden Perfection, Maincrop, Vick's Criterion bring up the rear, which, I consider are first-class varieties for small establishments. I have cultivated all of them this season in a lean-to house facing south, in 8 and 9-inch pots, and it is astonishing what fine fruit can be gathered from the plants, and the weight of fruit per pot ranges from 2 lb. to 3 lb. These plants are now put out against the kitchen-garden walls with fruit still upon them, and where I hope they will continue to grow and fruit for some time to come; of course, these have been well fed. In an ordinary season this is the best plan by which to obtain Tomatos from outside plants, and being strong plants, they have but little growth to make before fruiting, and simply perfect the fruit that was already set. *W. A. Cook, Compton Bassett, Calve.*

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 7 AND 8.—This meeting and Conference, lasting for two days, took place in the gardens of the Society, the exhibits being disposed in two large tents. There was a fair display of hardy flowers, Strawberries, and Gooseberries, contributed by a few nurserymen, gentlemen's gardeners, and amateurs. It is late in the season to find Strawberries in any numbers growing in pots; still, the nurserymen must be credited with showing a great number of varieties in this manner, in some instances heavily laden with fruits—but the best of these looked more like plants which had been recently lifted from the open ground and potted; anyhow, they served to illustrate habit, kind of foliage, length of fruit-stalk, and strength of plant, and in that way served a useful purpose. We fail to see what useful end is served by inviting exhibits of green Gooseberries; and although these were plentiful enough, the berries were much too large for tarts or bottling. Of Raspberries—one of the fruits of which samples were invited, we saw none.

The greater part of the floral display was to be found in a large tent specially set apart for it, and was interesting as a gay show of hardy flowers of the season. Novelties in species or varieties were few. It was pleasant to observe an absence of the usual jumble, there being plenty of space between the individual exhibits.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. H. Herbst, J. O'Brien, W. C. Leach, R. B. Lowe, L. Castle, C. Jeffries, G. Gordon, H. B. May, W. Goldring, B. Wynne, R. Dean, G. Paul, H. Cannell, G. Nicholson, H. Turner, and Dr. Masters.

A pretty group was set up by Messrs. J. Veitch & Sons, Chelsea, which was awarded a Silver Banksian Medal. It consisted of hardy biennials, perennials, and small shrubs. Taking the last first, we observed various Escallonias, var. Philippiana, small white flowers; Exoniensis, pale rose-coloured flowers, and pterocladon, white. The beautiful *Andromeda speciosa pulverulenta* and *A. p. cassinifolia* were shown in well-flowered examples, the former with long racemes of white campanulate flowers, larger than those of the latter species. *Berberis aristata* was shown, as long flowering shoots, well set with yellow blossoms.

The pretty small-growing *Philadelphus microphyllus* was observed, well set with its white blossoms. The giant campanulaceous plant, *Ostrowskia magnifica* was shown, one fine large bloom; also *Gerbera Jamesoni*, a showy composite of scarlet-orange colour set on a scape 2 feet high. In the rest of the collection were to be seen Wallflower-leaved Stocks, *Gaillardia hybrida*, many varieties of Canterbury Bells, single and double-flowered; *Dianthus Napoleon III.*, a bright crimson; a double form of *Lychnis dioica*; the white-flowered *Gentiana Kaufmannii*; *Campanula latifolia*, and a collection of brilliant coloured *Potentillas*.

A Pink of pleasing marking, *i.e.*, a purple band round each of its white petals, and named The Rector, was shown by Mr. C. Turner, Royal Nurseries, Slough. Other Pinks, with more or less similar marking, and named Princess Louise, Boiard Minerva, as well as some seedlings. *Delphiniums*, &c., were likewise shown by him. An Award of Merit was made.

A novelty in *Godetia White Pearl* was shown by Messrs. J. Carter and Co., High Holborn. It has smaller flowers than G. Duchess of Albany, which was shown alongside, and which is one of the whitest *Godetia* hitherto known. The height of the novelty would be about 18 inches.

Mr. R. Dean, Florist, Bedford, exhibited his handsome Ten-week Stocks, Mauve Beauty and Princess Alice, white-flowered; *Chrysanthemum Sibthorpii*, a pale yellow variety, probably a form of *C. segetum*; some Canterbury Bells, in variety, and Sweet Williams of much merit.

The useful late-flowering, hardy Azaleas, hybrids, probably of several allied species, were shown by Mr. A. Waterer, Nurseries, Knap Hill, Woking. The colours varied from white to pink of different hues.

A few Orchids were noted; amongst them, from Mr. Prewett, Swiss Nursery, Hammersmith, a fine-looking *Acrides maculosum*, Prewett's var., about which some interest is sure to centre. It may be found at length to be from the same region as

A. Schroderi, there being a good deal of resemblance to that species. The same exhibitor had *Odontoglossum cordatum*, *Angraecum caudatum*, &c.

Messrs. Pitcher & Manda, Hextable, Swanley, showed a very handsome *Cypripedium Brownii*—*C. magnificum* × *C. leucorrhodum*. The lip is large pale pinkish-brown, with a trace of green in it, the petals 5 inches long, slightly inclining downwards, straight and twisted, pink for half their length, the rest white; sepals white suffused faintly with pink near their bases.

Messrs. Seeger & Tropp, nurseries, Lordship Lane, Dulwich, had various forms of *Cattleya Gaskelliana*, mostly handsome ones. *Cattleya Mossiae formosa*, a flower mostly rosy-purple in colour; *Lælia Xanthina*, and a partially-flowered spike of *Grammatophyllum Seegerianum*, which had been produced on the journey from the Moluccas. From what we could observe the flowers will, when properly developed, be not unhandsome.

A quantity of the native *Orchis maculata* was shown by Mr. Harden, gr. to the Dowager Marchioness of Huntley, Cole Orton Hall. They had been grown, and well-grown too, on a north border in the kitchen garden at that place.

Some beautiful bunches of *Alstromeria aurantiaca*, *A. pelegriana*, &c., were shown by Mr. Leach, gr. at Albury Park, Surrey, he receiving a vote of thanks for the exhibit.

Miss Falkner was a magnificent double-flowered tuberous-rooted *Begonia*—shown by Messrs. H. Cannell & Sons, Home of Flowers, Swanley.

Messrs. B. Debenham, St. Peter's, St. Albans, had a small lot of hardy subjects, and Mr. T. Laxton, Bedford, showed *Pink Mrs. Sinkins*, and several other good white *Pinks*, but none that equalled the first-named. *Pink Lady R. Churchill* is a pretty flower marked with a purple ring around the central part.

A dwarf *Centaurea cyanus*, measuring not more than 6 inches in height, and with correspondingly small flowers, of a deep blue colour, came from Mr. H. Herbst, Kew Road, Richmond.

Pinks and single *Roses* were shown together by Mr. B. Ladham, Shirley Nursery, a pretty combination of forms and colours.

COMPETING CLASSES.

These were few; one for eighteen varieties of hardy-flowering perennials, in which W. Marshall, Esq., Achinrath, Bexley (gr., Mr. Pratt), took the 1st prize and the Silver Flora Medal. We noted in this group *Campanula arvensis* flore pleno, *Thalictrum glumaceum*, *Delphinium florum*, *Campanula Van Houttei*, *Lysimachia thyrsoiflora*, and the bright rosy-crimson-flowered *Epilobium angustifolium*; E. M. Nelson, Esq., Haager Hill, Ealing, was 2nd.

In another class, for the same number of perennials, O. T. Hodgson, Esq., Lachine, Chislehurst, was 1st; in this lot were *Astrantia Biebersteinii*, a better plant than *A. majus*; *Sidalcea Oregana candida*, and *Lathyrus Drummondii*, &c.; 2nd, Mr. G. H. Sage, Ham House, Richmond.

For Messrs. Kelway & Son's special prizes, Mr. T. H. Crasp, gr., Canford Manor, Dorset, showed *Gaillardia hybrida* in six varieties.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. P. C. M. Veitch, W. Denning, W. Bates, G. Reynolds, G. Wythes, J. Hudson, A. Dean, H. Balderson, and J. Cheal.

A large collection of Strawberries, in pots and in punnets, came from Messrs. Paul & Son, The Old Nurseries, Cheshunt—it consisted of the principal varieties in cultivation in this country; but as regards some fine varieties, the Society's collection was the more complete one. We mention the following:—Lucas, Dr. Hogg, a variety to grow where British Queen will not grow well, as it has the flavour—a little less marked, certainly, of that variety; Sir J. Paxton, Noble, fine to the eye; Vicomtesse H. de Thury, small, but of good flavour, and a great bearer; The Captain, King of the Earlies, Noble, all three of Mr. T. Laxton's raising, and filling a place in the market grower's list of varieties; Commander, Marie Nicaise, President, A. F. Barron, a very handsome berry; Pauline, Marguerite, Crescent Seedling, an American variety of some repute, but not so good here. It is bright in colour, and a good bearer, well suited for preserving whole, or as jam; Oxonian; Auguste Boisselot, a fine prolific, bright in colour, and bearing a long time; Belle de Meaux, an alpine variety, of dark crimson colour; Auguste Nicaise, late in coming into

bearing, conical in form, prolific, with strong foliage; Marie Nicaise, large, globular, slightly conical, light crimson, seeds embedded in the flesh; Comtesse Trelakoff, an alpine or Hautbois, of conical shape, small, and dark crimson in colour; Premier, with sparse foliage and large fruits; and La Grosse Sucrée.

Messrs. Paul & Son showed also a number of varieties of Gooseberries in the green state, mentioning the names of which will serve no useful purpose.

Mr. J. Watkins, Pomona Farm, Withington, Herefordshire, showed a number of Strawberries in small dishes. Of rather unusual varieties, we may name Kerr's Prolific, Pollissimer, and Sharpless, all of North American origin, and the last-named considered by the Americans their best Strawberry; All Round, Marshal MacMahon, Amateur, Wonderful, a berry which does not ripen at the point; Barnes' Prolific, Comte de Paris, &c. Fifteen dishes of Apples of 1890, in good condition, were observed. These consisted of Whiting Pippin, a fruit that often comes with two or three eyes; Winter Greening, Farmers' Seedling, Moss' Incomparable, Court Pendu Plat, Downton Nonpareil, Broad Tail, Herefordshire Pearmain, Winter Queening, and Golden Russet.

Ripe fruits of Ogden black Currants were shown by Mr. Watkins, in proof of earliness.

Mr. Leach, Albury Park, showed some thirty-five varieties of Strawberries, but without names. They were fine fruits, well ripened.

Mr. R. Gilbert, gr., Burghley House, Stamford, showed his new Strawberry, Chief Secretary, alleged to be earlier than John Ruskin, King of the Earlies, and Noble; it is a good doer, and very fruitful. The fruit is wedge-shaped, and in colour dark crimson.

Mr. W. Taylor, Hampton, had *Grove End Scarlet*, an old variety, excellent for jams, &c.; *British Queen*, a good sample of this variety, and *Sir C. Napier*.

About sixty dishes of Strawberries was the Society's contribution to the show, and this collection, besides containing all the popular varieties, had others, which deserve all commendation. We mention a few:—John Ruskin, Old Pine, Helena Glode, Countess, Trollope's Victoria, Bothwell Park, Sabreur, Jewel, Filbert Pine, Crown Prince, Bidwell Seedling, The Pilot, Premier, and Harris's A 1.

Some very large fruits of *Jas. Veitch* and *Latest of All Strawberries*—which, by the way, rather belies its name by fruiting at all at this season—came from E. Amies, Esq., Ashford Road, Maidstone.

A rather numerous collection of Strawberries in pots and in punnets were exhibited by Messrs. G. Bunyard & Co., Maidstone, and consisted of most of the favourite varieties grown in gardens.

Other than these, mention may be made of *Mons. Fournier*, resembling *Dr. Hogg*; *Brown's Wonder*, *La Boule d'Or*, *J. Ruskin*, a pretty fruit, but rather flat in flavour; *Frogmore Pine*, *Royal Hautbois*, *Alpine Triomphe d'Orleans*, *President de la Cour*, *Usher Fritz*, *Competitor*, and several of North American origin.

Several very fine seedlings were brought by Mr. W. Allan, Gunton Park, Suffolk; all were showy well-shaped fruits, some of which the judges thought were improvements on existing varieties.

A large collection was shown by Mr. T. Laxton, Bedford, and contained many new names, as well as good-looking fruits. Mr. Laxton is doing much work in this field, and amongst the many that he has raised and is raising, some novelties of merit are from time to time getting into commerce.

COMPETING CLASSES.

Mr. W. Palmer, Surrey, was 1st, for six dishes of Gooseberries; 2nd, Mr. J. Gilbert, Rectory, Mew, Guildford. These were large for the time of year. E. M. Nelson, Esq., Ealing, was 1st for four dishes of Strawberries, showing *British Queen*, *Vicomtesse H. de Thury*, *Sir J. Paxton*, and *Noble*. Mr. Nelson was 1st for one dish, namely, *Sir J. Paxton*; and 1st in Messrs. Sharp & Co.'s prizes for three dishes of Peas, showing *the Queen*, *Triumph*, and *Sir F. A. Millbank*; the first two have short, dark green pods, well filled with very dark green-coloured seeds. Mr. W. Palmer was 1st for two dishes of green Gooseberries, and 2nd for two of ripe kinds.

MISCELLANEOUS.

Some immense sticks of a seedling *Rhubarb* were shown by Mr. Davis, High Road, Chiswick.

Messrs. R. Veitch & Sons, 51, High Street, Exeter, showed *Pea Exonian*, a first Early Wrinkled Marrow, having a well-filled small pod, with Peas of a rich green colour.

Mr. G. H. Pontin, Stanley Vineries, Woking, showed some very large, heavy Melons, named *Sutton's Triumph*, *Golden Triumph*, *Conqueror*, and *Golden Perfection*—this last-named kind weighed 10 lb. 12 oz.

Mr. W. Leach showed *Penches*, and Mr. J. W. Church, The Vineyard, Braconash, Black Alicante Grapes, cut on January 6, 1891, in a good condition, considering the length of time that has elapsed since they ripened.

A large bunch of a small-fruited good-flavoured Banana was shown by Mr. Fitt, gr. to Earl Cowper, Panshanger. The bunch was 2 feet in length, and was well set with fruit from end to end.

Eight grand *Queen Pine*-apples were shown in the cut state by Mr. T. Coomber, gr., The Hendre, Monmouth. A *Silver Banksian Medal* was awarded Mr. Coomber.

The tent in which the bulk of the hardy flowers were arranged furnished a charming display of hardy summer blossoms. On the south side, Messrs. Kelway & Son, of Langport, staged 200 spikes of *Delphiniums*—a collection of such varied hues and fine varieties as could not perhaps be furnished by any other nursery in the kingdom. In the matter of novelty of colour, Messrs. Kelway & Son have taken a decided lead. A selection of the finest varieties would include *Premier* and *Rivoli*, both with massive spikes of flowers, deep blue edged with cerise; *The Vicar*, *Beatrice Kelway*, *Lady Rowena*, *Robin Adair*, a large bright blue single variety (*Award of Merit*); *Hereward*, *Gilbert Kelway*, *Hermione*, *Britannia*, deep blue with white centre; *Beauty of England*, *Sequence*, *Monument*, very delicate and soft lilac—a very distinct shade; *Sophia*, *Modelle*, *General Earle*, *Donovan*, *Breunans*, *Lord Balfour*, and *Edgar Wild*. These, staged against the white background of the tent, made a rare display. In addition, Messrs. Kelway & Son had a large collection of *Gaillardias*, including *Glenavon*, a fine and very showy variety; and *Helicon*, large yellow; *Iris Kämpferi* in variety, *Crinum McOwanii*, and bunches of hardy flowers, such as *Campanula trachelium*, fl.-pl.; *C. persicifolia* alba, *Cephalaria lutea*, *Spiraea aruncus*, *S. palmata elegans*, *Verbascum Choisii*, &c.

On the opposite side, Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, S.E., had an exceedingly bright, varied, and well-arranged collection, which included *Heuchera sanguinea*, *Doronicum plantaginum excelsum*, *Chrysanthemum latifolium*, *Campanula turbinata*, *Brodiaea coccinea*, *Salvia Tenori*, *Armeria cephalotes rubra*, *Helianthus multiflorus plenus*, *Alstromerias*, in variety; *Dianthus Emilie Parc*, a charming flesh-pink variety; *Amaryllis longifolius albus*, *Centaurea Cyanus*, *Spiraea aruncus*, *Richardia hastata*, with its pale Primrose blossoms; *Spiraea palmata*, *Lilium auratum*, *Carnation Madame A. Warocque*; *Lilium speciosum*, *Pyrethrus*, *Rosa rugosa*, *Amberboa moschata*, with its golden-yellow blossoms, an excellent subject for cutting from; *Saxifraga pyramidalis*, *Canterbury Bells* in variety; *Gladiolus Colvilli*, and *G. ramosus*; bunches of *Violas*, *Pansies* and *Carnations*, *Papaver orientale*, &c.

Following this, on the same side, came a smaller but very interesting collection, from Mr. T. S. Ware, Hall Farm Nurseries, Tottenham, which included a number of *Lilies*, such as *Elegans*, *Fulgens*, *Hansonii*, *Washingtonianum*, an American species, in which the flowers open pale coloured, and change to a pale rosy-purple. *Maritimum*, a very distinct small flowered species, awarded a *Botanical Certificate*; *Canadense*, *Parryi*, *pulchellum*, a very bright and effective species; *pardalinum*, *colchicum*, *Martagon album*, and *pomponicum verum*; also *Geum coccineum*, *Lupinus polyphyllus*, *Centaurea montana*, in variety; *Campanula persicifolia alba*, *Delphinium cashmerianum*, and varieties of *D. formosum* and others; *Armeria plantaginina rosea*, *Pink Her Majesty*, *Heuchera sanguinea*, *Lychnis Haagerana*, a very bright single form; *Veronica spicata*, *Campanula carpatica*, *Triteleia Murrayana*, *Mertensia sibirica*, and *Linum flavum*.

On the central stage, Messrs. Paul & Son, Old Nurseries, Cheshunt, had a large and valuable collection staged with commendable taste, which included *Veronica anomala*, a white-flowered dwarf hardy shrub (*Award of Merit*); *Prunella Webbiana*, bright rose (*Award of Merit*); *Canna Jules Chretien*, rich crimson; *C. Comte H. de Choiseul*,

vivid scarlet; and *C. Admiral Courbet*, deep orange; Pæonies, among these a beautiful delicate blush variety named *Emile Galle* (Award of Merit); *Centaurea macrocephala* (see fig. 4, p. 39), with its large golden heads, *Chrysanthemum latifolium*, *Phlox ovata*, *Polemonium Richardsoni*, *Epilobium angustifolium*, and its white variety; *Brodiaea congesta*, *Carduus heterophylla*, *Salvia dealbata*, with its large leaves and huge spikes of pale lavender flowers; *Potentilla*, double, *Wm. Rollisson*, rich orange; *Mars*, and *Belzebath*, *Cephalaria alpina*, *Achillea serrata plena*, earlier to bloom than the others, and very free; *Geranium Endressi*, *Campanula Hosti*, and its white variety; *Ruta patavina*, yellow, said to be a little difficult to grow, but very charming in a mass; *Orchis foliosa*, *Clematis integrifolia major*, and *C. erecta*, with dense clusters of small white flowers; *Lilium rubescens*, *L. columbarium*, *Gaillardia grandiflora*, *Campanula persicifolia alba plena*, *Astrœmeria aurantiaca*, *Pentstemon pubescens*, *Pyrethrum cinerariaefolium*, small, well formed pure white flowers, and *Distamus fraxinella*.

Next came a select collection of extremely interesting subjects from the Royal Gardens, Kew. This included *Sphæralcea rivularis*, with pretty pink blossoms closely allied to *Malva*; *Gentiana lutea*, *Lahia lanata*, *Dianthus viscidus*, *Phlomis tuberosa*, *Erigeron salsuginosus*, *Pentstemon barbatus*, *Lathyrus grandiflorus*, *Campanula rhomboidalis*, *Erysimum Wahlenbergii*, pale yellow; *Cosmos bipinnatus*, a handsome annual, with bright reddish-purple flowers; *Pyrethrum cinerariaefolium*, with white flowers—small and single; *Bremostachys laciniata*, *Dianthus Griesvii*, and *Campanula excelsa*, a small but interesting species.

Mr. G. Fennell, gr., Fairlawn, Tunbridge, Kent, showed a peculiar novelty in fruits of *Nectarine Violet* *Hâtive* in three stages of growth, quite small and green, half-grown and beginning to colour, and lastly, ripe fruits. These had been taken from different parts of one tree, and all similar fruits will ripen, as in several years past, in a satisfactory manner.

NATIONAL ROSE SOCIETY, CRYSTAL PALACE.

JULY 4.—The National Flower was not seen to the best advantage at the Crystal Palace on Saturday, but not from any fault of the Rosarian. He had planted, watered, and budded his Rose trees with a devotion worthy of all praise; but Nature proved in an unkindly mood, and withheld that assistance she usually renders. Roses were held back by an unusually late spring, and when summer weather broke it was fitful—days were hot and dry, the nights cold, and then when at last the flowers opened tardily and imperfectly, storms came and disfigured them to the great grief of the exhibitor. It was from no defect in the "blazing arch of lucid glass" overhead which made the flowers look dull, they were dull generally—though here and there, but rarely so, blooms were fresh, bright, clean, and winsome. A large number of blooms were staged, the tea-scented varieties shown by amateurs were very good for the season; those staged by the trade about as bad as they could be in the present era of Rose culture. The crimson and scarlet hybrid perpetuals were brilliant in some instances, old General Jacqueminot, after nearly forty years' culture, shone out with astonishing brilliancy, and was actually selected from the flowers shown in the amateurs' classes, as the best hybrid perpetual, and awarded the Silver Medal of the Society! "Brave old General"—so useful in many ways, that the next Rose-loving Dean of Rochester may perchance see it in the Horticultural Hall of the future in another forty years.

As is usual, the flowers were staged on tables placed along the eastern portion of the nave. Roses are not seen to the best advantage staged in green boxes placed on naked dull green tables, that show an abundance of boxes beneath; but it is the best system the wisdom of the National Rose Society has been able to devise, and we must not grumble; but somehow the thing is not as one would like to see it. Rose-cups and wire supports have improved the floral effect, but a sense of incongruity remains.

Nurserymen's Classes.—In the leading class for seventy-two varieties, distinct, there were three exhibitors, and Mr. B. R. Cant, nurseryman, Colchester, won the 1st prize and the Challenge Trophy, held by his nephew during the last two years. It was not a standard seventy-two, but it was good in such a trying season, and the Tea-scented

varieties greatly added to its value. We give the names of the Roses, many of which were repeated in other collections. Of H.P.'s, Mr. Cant had *A. K. Williams*, *Abel Carrière*, *Mons. E. Y. Teas*, *Mrs. J. Laing*, *Ulrich Brunner*, *Victor Verdier*, *Duke of Edinburgh*, *Madame Gabriel Luizet*, *General Jacqueminot*, *Baroness Rothschild*, *La France*, *Annie Laxton*, *Jean Liabaud*, *Madame Victor Verdier*, *Xavier Olibo*, *Exposition de Brie*, *Paul Neyron*, *Victor Verdier*, *Prince Camille de Rohan*, *Marie Baumann*, *Victor Hugo*, *Alfred Colomb*, *Countess of Rosebery*, and *Alphonse Soupert*. Tea-scented:—*Souvenir de Paul Neyron*, *Maréchal Niel*, *Caroline Kuster*, *Comtesse de Nadaillac*, *Cleopatra*, *Catherine Mermet*, *Princess of Wales*, *Madame Hippolyte Jamain*, *Madame Lambard*, *Jean Ducher*, *La Boule d'Or*, *Madame Bravy*, *Madame de Watteville*, *Madame Hoste*, *Madame Willernuez*, *Souvenir d'Elise Vardon*, *Francisca Kruger*, and *Innocente Pirola*. 2nd, Messrs. Paul & Sons, Old Nurseries, Cheshunt, in whose collection the H.P.'s were the strongest, and some of them brilliantly coloured. There was not very much to choose between these two stands. Messrs. Prior & Son, Myland Nurseries, Colchester, were 3rd.

In the class for forty-eight varieties, three trusses of each, there were but two exhibitors, and Mr. B. R. Cant was again 1st.

In the class for forty-eight distinct, single trusses, there were seven competitors, and Mr. Charles Turner, Royal Nursery, Slough, attained 1st honours; 2nd, Messrs. G. & W. Barch, nurserymen, Peterborough; 3rd, Mr. George Prince, nurseryman, Oxford.

There were four collections in the class for twenty-four varieties, single blooms, and here Mr. George Mount, nurseryman, Canterbury, was 1st, with a very bright and clean lot of flowers; 2nd, Mr. J. Mattock, nurseryman, New Headington, Oxford; 3rd, Mr. E. F. Such, Maidenhead.

There were eight exhibitors of twenty-four varieties, three trusses of each, and Mr. Geo. Prince took the 1st prize; 2nd, Mr. G. Mount; 3rd, Mr. C. Turner.

Garden Roses (Nurserymen).—The 1st prize for the best thirty-six bunches of garden Roses, distinct varieties, was won by Messrs. Paul & Son, Old Nurseries, Cheshunt. These Roses attracted considerable attention, and it would be hard to find any flowers much prettier. The following are a few of the most striking varieties:—*Miss Blanche Moreau*, *Reine Olga de Wurtemberg*, *L'Idéal*, *Reine Marie Henriette*, *Polyantha var. Simplex*, *P. Perle d'Or*, *P. Mignonette*, *P. grandiflora*, *Madame Plantier*, *Macrantha*, *Crested Moss*, and *Little Gem*. Messrs. G. Cooling & Son, Bath, was 2nd; and Mr. E. F. Such, Maidenhead, 3rd.

Amateurs' Classes.—The principal class was for forty-eight varieties, single trusses, and there were five competitors; an additional interest was lent to this particular class, because the Challenge Trophy won last year by Mr. E. B. Lindsell, of Hitchin, who captured it again on this occasion with some very good blooms indeed, the season considered. He had of H.P.'s *Heinrich Schultheiss*, *Mons. E. Y. Teas*, *Grand Mogul*, *Maurice Bernardin*, *Duke of Albany*, *Mrs. J. Laing*, *Marquis de Castellane*, *Duke of Teck*, *Duke of Edinburgh*, *Rosieriste Jacobs*, *A. K. Williams*, *Victor Verdier*, *Comtesse d'Oxford*, *Dupuy Jamain*, *Marie Verdier*, *Comte Raimbaud*, *Prince Arthur*, *Abel Carrière*, *Xavier Olibo*, *Charles Lefebvre*, *Pride of Waltham*, *Dr. Sewell* and *Lady Mary Fitzwilliam*. Tea Scented, *Cornelia Koch*, *Boule d'Or*, *Catherine Mermet*, *Innocente Pirola*, *Comtesse de Nadaillac*, *Marie van Houtte*, *Souvenir d'Elise*, *Anna Olivier*, and *Etoile de Lyon*. 2nd, Dr. S. G. Budd, Bath, who ran Mr. Lindsell very close indeed for 1st place. 3rd, the Rev. J. H. Pemberton, Havering Atte, Romford.

In the next class for eighteen distinct varieties, three trusses of each, Dr. Budd was 1st with *Marie Baumann*, *Abel Carrière*, *Marquise de Castellane*, *Mons. E. Y. Teas*, *Louis van Houtte*, *Mrs. J. Laing*, *Duchesse de Vallombrosa*, *Prince Arthur*, *A. K. Williams*, *François Michelon*, *Alfred Colomb*, *La France*, *Etiénne Levet*, *Her Majesty*, *Madame Gabriel Luizet*; and Tea-scented—*The Bride*. 2nd, Mr. E. B. Lindsell. 3rd, the Rev. H. A. Berners, Harkstead Rectory, Ipswich.

In the class for thirty-six varieties, single trusses a piece of plate, value 5 guineas, being given by R. G. N. Baker, Esq., in addition to the 1st prize, Mr. C. J. Salter, gr. to T. B. Haywood, Esq., Wood-

hatch, Reigate, was 1st, having good blooms of *Countess of Rosebery*, *Charles Lefebvre*, *Auguste Rigotard*, *Marie Baumann*, *Madame Victor Verdier*, *Duchess of Bedford*, *Duke of Teck*, *Comtesse de Serenye*, *Madame Gabriel le Luizet*, *Duchesse de Vallombrosa*, *Mrs. John Laing*, *Exposition de Brie*, *Marie Verdier*, *Dupuy Jamain*, *Dr. Andry*, *Mrs. Laxton*, *Comtesse d'Oxford*, *Mrs. Baker*, *Bride of Reigate*, the striped form of *Countess of Oxford*, very well shown on this occasion; *A. K. Williams*, *François Michelon*, *Etiénne Levé*, *Madame Thérèse Levé*, *Her Majesty*; and Tea-scented *Alba Rosea* and *Viscountess Folkestone*. 2nd, Colonel J. H. Pitt, Turkey Court, Maidstone. 3rd, the Rev. W. H. Jackson, Stagden Vicarage, Bedford.

For twelve triplets, T. E. Haywood, Esq., Woodhatch Lodge, Reigate (gr., G. J. Salter), was 1st, with blooms of *Captain Christy*, *Marquise de Castellane*, *A. K. Williams*, *Madame Gabriel Luizet*, *La France*, *Duke of Teck*, *Mrs. J. Laing*, *Auguste Rigotard*, *Violette Bouyer*, *Etiénne Levé*, *E. Y. Teas*. Col. J. H. Pitt, Turkey Court, Maidstone, 2nd; and the Rev. J. W. Jackson, Stagden Vicarage, Bedford, 3rd. For twenty-four distinct, single, Mr. A. Tait, Downside, Leatherhead, was 1st; also winning the Silver Medal of the *Gardeners' Magazine*. Among the blooms in this box, were fine specimens of *Marie Baumann*, *Duchess of Bedford*, *Xavier Olibo*, *La Rosière*, and *Eugène Verdier*. Mr. J. Brown, gr. to Mrs. Waterlow, Great Doods, Reigate, was 2nd; and Mr. Ed. Mawley, Rose Bank, Berkhamsted, 3rd.

For eight triplets, Mr. R. E. West, Reigate, was 1st; Mr. A. Tait, 2nd; and Mr. J. Brown, 3rd. For eighteen distinct single trusses, Mr. T. Budgen, gr. to Mrs. F. P. Baker, Hoiwells, Reigate, was 1st; Mr. Romaine, Old Windsor, 2nd; and Mr. W. Narrows, Haddington Quarry, Oxford, 3rd. For twelve distinct single trusses, Mr. R. L. Knight, Bobbing, Sittingbourne, was 1st; *Captain Christy*, *Hill Green House*, *Stockbury*, *Kent*, 2nd; and Mr. C. J. Grahame, *Coombe Road*, *Croydon*, 3rd. For nine distinct single trusses, The Rev. F. S. Taylor, *Littleton Vicarage*, *Evesham*, was 1st; Mr. E. Williams, *Lyndhurst*, *Sutton*, 2nd; and the Rev. H. B. Biron, *Lympe Vicarage*, *Hythe*, 3rd. For six distinct, Mr. E. Horne, *Park House*, *Reigate*, was 1st; *M. Hodson*, *Esq.*, *Shirley Cottage*, *Croydon*, 2nd; and Mr. S. E. Crofts, gr. to W. D. Freshfield, *Esq.*, *Reigate*, 3rd. For six triplets, Mr. O. P. Orpen, *Colchester*, was 1st, with a box containing nice blooms of *Camille Bernardin*, *Climbing Capt. Christy*, *Niphetos*, and others. Mr. E. Wilkins, *Sutton*, 2nd; and Mr. P. G. C. Barraud, *Reigate*, 3rd.

For six, distinct, Mr. G. Rutter, *Shepperton-on-Thames*, was awarded 1st prize.

For twenty-four distinct single trusses, Mr. A. Tait, *Leatherhead*, was awarded the National Rose Society's Silver Cup, for a very fine lot; among them were *Duchess of Albany*, *Catherine Mermet*, *Mrs. J. Laing*, *Innocente Pirola*, *Violette Bouyer*, *Her Majesty*, *Madame Eugène Verdier*, *A. K. Williams*, *La Rosière*, *Madame Cusin*.

Tea and Noisette Roses; Amateurs.—In class 30, for six distinct varieties, single trusses, the Rev. F. S. Taylor, *Littleton Vicarage*, *Evesham*, was 1st, with *Marie van Houtte*, *Maréchal Niel*, *The Bride*, *Anna Olivier*, *Hon. Edith Gifford*, and *Niphetos*; 2nd, Mr. E. Mawley, *Rosemount*, *Berkhamsted*; 3rd, the Rev. H. B. Biron, *Lympe Vicarage*, *Hythe*.

Class 31 was for twelve Teas and Noisettes, three trusses of each. In addition to the 1st prize was a piece of plate, value five guineas, given in memory of the late Hon. and Rev. J. T. Boscawen. This was won by A. H. Gray, Esq., *Newbridge Hill*, *Bath*, with some admirable flowers; 3rd, the Rev. W. H. Jackson.

The best six distinct varieties, three trusses of each, came from the Rev. A. H. Foster Melliar, *Sprunston Rectory*, *Ipswich*, who had *Princess of Wales*, *Etoile de Lyon*, *Francisca Kruger*, *Madame de Watteville*, *Marie van Houtte*, and *Madame Hoste*; 2nd, Mr. E. B. Lindsell; 3rd, Col. J. H. Pitt.

The best six trusses of any Tea or Noisette came from Mr. A. H. Gray, who had finely-coloured *Maréchal Niel*; Mr. C. J. Graham, *Coombe Road*, *Croydon*, was 2nd; and the Rev. H. A. Berners 3rd, with *Comtesse de Nadaillac*.

In the amateur classes, the varieties shown were, with a few exceptions, the same as those shown in the nurseryman's classes. A. H. Gray, Esq., *New Bridge Hill*, *Bath*, won the 1st prize for eighteen distinct Tea or Noisette, which included

the holding of the Challenge Trophy for one year. The Rev. H. Berners, Harkstead Rectory, Ipswich, came 2nd; and the Rev. A. Foster Melliar, Sprouton Rectory, Ipswich, 3rd.

For twelve distinct single trusses, Mr. E. B. Lindsell, Bearton, Hitchin, was 1st in a good competition, and was awarded the *Gardeners' Magazine* Silver Medal for excellent culture. Mr. A. H. Gray, Bath, 2nd; and Mr. T. B. Haywood, Woodhatch Lodge, Reigate, 3rd.

Mr. F. G. Orpen, Hillside, West Birgholt, Colchester, was 1st for nine distinct trusses; Mr. G. A. Tait, 2nd; and Mr. S. Crofts, The Wilderness, Reigate, 3rd.

In the Tea and Noisette division, some very fine blooms were staged, and good competition showed itself throughout. In the nurserymen's classes, Mr. G. Prince, Market Street, Oxford, was the only exhibitor, twenty-four, distinct, with a splendid box, including the following varieties, *Souvenir d'un Ami*, *Souvenir de S. A. Prince*, *Belle-Fleur d'Ajon*, *Maréchal Niel*, *Madame Cusin*, *The Bride*, *Comtesse d'Nadaillac*, *Innocente Pirola*, *Mrs. J. Wilson*, *Jules Frager*, *Marquise de Sanina*, *Alba Rosen*, *Princess of Wales*, *Catherine Mernet*, *Etoile de Lyon*, *Madame de Watteville*, *Rubens*, *Hon. Edith Gifford*, *Jean Ducher*, *Marie van Houtte*, *Cornelia Koch*, *Niphotos*, *Marie Armand*, *Madame C. Kuster*.

For eighteen, distinct, Mr. J. Mattock, New Headington, Oxford, was 1st; Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, were 2nd; and Messrs. W. Paul & Son, Cheshunt, 3rd.

Mr. B. R. Cant, Colchester, was 1st for twelve single trusses of any Tea or Noisette, with a fine box of *Madame de Watteville*; Mr. G. Prince, 2nd, with *The Bride*; and Mr. J. Mattock, Oxford, 3rd, with *Hon. Edith Gifford*.

For six triplets, Mr. G. Prince was 1st; Mr. J. Mattock, New Headington, Oxford, 2nd; and Mr. G. W. Piper, Uckfield, Sussex, 3rd.

Garden Roses (Amateurs).—In this class, the 1st prize was awarded to Mr. Charles E. Cuthell, Chapel Croft, Dorking, for an excellent collection, nicely arranged in bunches, of the following:—*Austrian Yellow*, *Macrantha*, *Red Damask*, *Polyantha Pasquette*, *Perle d'Or*, *Austrian Copper*, *Miss Blanche Moreau*, *Gloire de Polyantha*, *L'Idéelle*, *Ellet Flamand*, *Rugosa*, *Madame Georges Bruant* (double white), *H.P. Bardon Job* (large single crimson), *Moscata alba*, and *Lucida plena*, as the leading flowers; 2nd, the Rev. J. H. Pemberton, with the red and striped *Provence*, *Rugosa rubra*, common *Moss*, *Aimée Vibert*, *China Maiden's Blush*, *White Rugosa*, *Damask*, &c.; 3rd, Mr. Alfred Tate, Leatherhead.

Open Classes.—The best twelve trusses of any yellow Rose, except *Maréchal Niel*, came from Mr. George Prince, Oxford, who had *Comtesse de Nadaillac*, with that rich Apricot glow Mr. Prince imparts to it. He was the only exhibitor staging, in addition, a box of *Marie van Houtte*.

There were ten exhibitors in the class for any white Rose, except *Niphotos*, and Mr. George Dickson, nurseryman, Newtownards, co. Down, Ireland, staged a dozen exquisite specimens of *Margaret Dickson*, which was awarded the Gold Medal of the National Rose Society last year. It had something of the build of *La France*, and it is nearly white, having a slight tint of blush in the centre. It promises to be a very fine addition to our white hybrid perpetuals. Mr. A. H. Gray was 2nd, with *Alba Rosea*, &c.; and Mr. B. R. Cant, with the same.

The best twelve blooms of any crimson Rose, other than *Marie Baumann* and *A. K. Williams*, came from Mr. B. R. Cant, who had *Duke of Edinburgh*; Messrs. Paul & Son were 2nd, with *Prince Arthur*; and Mr. J. Parker, Old Headington, Oxford, 3rd, with *Duke of Teck*.

The best twelve blooms of any dark crimson Rose were those of *Prince Camille de Rohan*, shown by Messrs. H. Low & Co., Beech Hill Nursery, Enfield; Mr. Geo. Mount was 2nd, with *Fisher Holmes*; and Mr. Geo. Prince, 3rd, with *Prince Arthur*.

Mr. A. H. Gray had the best twelve blooms of *Maréchal Niel*, which were finely coloured; Mr. B. R. Cant was 2nd; and Mr. George Prince, 3rd.

Dr. S. P. Budd, Gay Street, Bath, was 1st for twelve blooms of *Marie Baumann*, a well-chosen, even lot of blooms, without a weak one; 2nd, Mr. C. Turner, Slough, with good but smaller blooms. Four competed in the above class.

Dr. Budd was also 1st for twelve Mrs. John Laing, showing a good box of this fine, bright, pink-coloured novelty, showing the good points of the flower; Mr. C. Turner was 2nd here likewise, Messrs. G. Cooling & Son being considered equal

with him. The flower was shown excellently in every instance. Competitors, six.

Twelve blooms of Miss A. K. Williams.—1st, Messrs. Paul & Son, Old Nurseries, Waltham; 2nd, Messrs. H. Low & Co., Clapton, and Bush Hill, Enfield, with perfect, if somewhat smaller blooms. Some beholders preferred this stand to Messrs. Paul's. Five competed.

Twelve blooms of *Niphotos*.—Here Mr. B. R. Cant, Colchester, was 1st, with blooms caught at the nick of time. Between these and Mr. G. W. Pipers', who was 2nd, was a wide difference, the latter's, being quite small buds by comparison.

Any H.P. Rose, twelve blooms.—In this class Mr. C. Turner took the highest honours with *La France*, very nice medium-sized blooms; 2nd, Dr. Budd, with the same variety; 3rd, Messrs. A. Dickson & Son, Newtownards, with their *Marchioness of Dufferin*. In this class the competition was very strong, but the competing varieties were few, viz., *Lady Fitzwilliam*, *Harich Schultheiss*, *Madame Gabrielle Luizette*, and *La France*.

New Roses.—The 1st place was taken by the Rev. F. R. Burnside with *Souvenir de Sarah A. Prince*, a perfect bloom of this novelty not always easy to show in good condition. 2nd, Messrs. Paul & Son, Old Nurseries, Cheshunt, with Mrs. Paul (Bourbon), a blush Rose with full centre; *White Lady* was also shown by them, but the warmth of the building had caused the not too numerous petals to expand fully. In the nurserymen's division of the class for new Roses, Messrs. A. Dickson took the 1st prize for *Margaret Dickson*, a lovely Tea of filbert-shape, the central cluster of petals showing blush, although single they appear white. Most of these were disappointing; though including those offered for the first time in English nurserymen's list in the spring of 1890. Messrs. Paul & Son were awarded the 1st prize, the varieties being H.P.'s *Comtesse de Blacas*, soft deep pink, of globular shape; *Marie Magat*, bright rosy-carmine, very like *Alfred Colomb*; *Madame Chabal*, bright pale rosy-scarlet; *Marchioness of Lorne*, deep rose; *Bruce Findlay*, very bright crimson; *J. D. Pawle*, shaded crimson; *Auguste Guinoisseau*, an almost white sport from *La France*; *Bourbon Mr. Paul*, and *Tea-scented Ernest Metz* and *Souvenir de S. A. Prince*. Messrs. G. Cooling & Son also exhibited.

There was no competition in the class for nine blooms of any new Tea or Noisette Rose, though a piece of plate was offered as a prize. The Society's Gold Medal was offered for three blooms of any new seedling Rose or distinct sport not yet in commerce, and, though several were staged, no Medal was awarded. *Lord Penzance*, *Easing Park*, *Godalming*, had H.P. *Rob Roy*, a seedling from General Jacqueminot crossed with *Village Maid*; in the bud like a large pale pink *Her Majesty* and *Roger Wildrake*, from *La Ville de Burgundy* and *Richard Laxton*, of the shape and colour of *Paul Neyron*, but somewhat coarse. Messrs. Paul & Son had H.P. *Charles Gater*, bright scarlet, but small in size. Messrs. William Paul & Son had H.P. *Spencer*, a beautiful soft pink flower, of the type of *Baroness Rothschild*; *Tea Corinna*, a variety that will yet win its way in the public estimation; *Zenobia* (Moss), pink, flushed with rose, and shaded with purple; and *Mango Park* (Moss), pale pinkish-rose, large and full. Mr. George Dickson, Newtownards, had *Marchioness of Dufferin* (H.P.), soft pink, flushed with a deeper tint—very pleasing in colour, large and full.

Premier Roses.—Four of the Society's Silver Medals were awarded for the best H.P. Tea-scented, exhibited by amateurs and also by nurserymen. In the amateurs' division, the *Premier H.P.* was *General Jacqueminot*, exhibited by Mr. R. L. Knight; and the *Premier Tea* a richly coloured *Madame Cusin*, shown by Mr. A. Tate. In the nurserymen's division, H.P. *Gustave Pigareau*, new, of 1889-90, a large and showy carmine-red variety, shown by Messrs. Paul & Son; and *Tea Souvenir de S. A. Prince*, shown by Messrs. Prior & Son, Colchester.

Miscellaneous.—Under this heading come the varied and interesting collection of hardy flowers shown by Mr. T. Ware, Hale Farm, Tottenham. Of novelties of merit in this group may be mentioned two yellow-coloured Carnations, *Pride of Great Britain* and *Miss Saunders*; and *Carnation*, *Scarlet Duke*, a fine thing, and one in which it is alleged the calyx seldom splits; a *Chrysanthemum leucanthemum*, named *Semi-duplex*; and *Spiraea japonica compacta*. *Iris susiana William I.* is a soft yellow-coloured flower, very telling in the mass;

white *Pink Her Majesty*, *Achillea serrata flore-pleno*, a pretty white flower, were also observed.

Messrs. P. Barr, King Street, Covent Garden, had a stand rich in herbaceous Peonies, in variety. *Nimrod*, a rich purple; *Lord Salisbury*, crimson; *Comte de Paris*, with thread-like and guard petals—white; *Couronne d'Or*, white; and *Helen Leslie*, double, also white; were amongst the more pleasing flowers. *Chrysanthemum maximum* was observed in good condition. A large plant of *Senecio microphyllum*, a plant with thick, fleshy, much-branched stems, bearing small yellow flowers of no great beauty.

Messrs. J. Laing & Sons, Forest Hill, S.E., put up a large pyramidal group of *Begonias*, of the tuberous-rooted section, including amongst the component plants some of their finest novelties. To cap the whole, was a large plant of *B. alba rosea*, a first-rate basket plant with good blooms. New were *Alice Mann*, yellow, a good hanging plant, equalling *B. t. peodula*; *Mrs. Joseph Chamberlain*, very large, white; *Avalanche*, white; *Leviathan*, an immense flower, dark rose; *Viscount Wolseley*, salmon rose, double; *Mrs. F. Nettlefold*, a very fine blush; *Lady Cloncurry*, bronze yellow, a single-flowered variety; and *Baron Schroder*, double, an orange scarlet.

Messrs. Carter & Co., High Holborn, showed a number of *Cactus*, *Mammillaria*, *Euphorbia*, *Cereus*, and other quaint-looking succulents, a taste for growing which, they say, is springing up. A very lovely display of all sorts of *Roses* in profusion was set up by Messrs. W. Paul & Son, not in competition, in front of the grand organ. Here were flowers old and new, garden favourites of fifty or more years ago, jostled by the novelties of the day. It was noted that varieties of *Moss Roses* and the lovely *Souvenir de la Malmaison* are in good condition this year, and particularly so on this stand.

WINCHESTER.

JUNE 30.—The Guildhall was, as usual, the site chosen for the annual summer exhibition in this old city, and which partook more of the character of a Rose show than aught else, as this flower was in the ascendant. A few other classes were provided. The *Roses* on the whole, for such an early date, were of fair size, very fresh and rich in colour.

The principal class was that for forty-eight blooms, distinct varieties. Mr. B. R. Cant, Colchester, was a good 1st, the blooms possessing much merit. Mr. C. Turner, Slough, 2nd. For twenty-four trebles, distinct, Mr. B. Cant was again the winner, having a capital lot; Mr. C. Turner 2nd.

Dr. S. P. Budd, Bath, was the most successful with twenty-four blooms, distinct sorts, with perhaps the best flowers in the show; Messrs. Keyoes, Williams & Co., Salisbury, 2nd. Dr. Budd followed up his success by taking 1st honours for twelve trebles, distinct sorts; Messrs. Keynes 2nd.

Some capital blooms were staged in the classes for twelve of one colour. Dr. Budd had the best H.P. dark variety, showing *Marie Baumann*, extremely neat, and rich in colour. Mr. C. Turner, with *La France*, won for any light variety. Mr. B. Cant, with *Niphotos*, occupied premier position for twelve Tea or Noisette.

The following classes were not open to nurserymen:—With a clean even lot, Dr. Budd was the most successful for twenty-four varieties, single trusses; the Rev. J. Pemberton, Havering, Romford, 2nd. In the class for twelve varieties, trebles, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was given 1st honours for a neat lot; Rev. J. Pemberton 2nd.

For six Teas or Noisettes, Dr. Budd was again 1st. The Rev. J. Pemberton won for twelve Teas or Noisettes with a good lot, Dr. Budd a close 2nd.

Stands of flowers arranged for table-decoration are always a feature at Winchester. For the best dressed stand, Miss Flight was an easy 1st; Mr. J. L. Trask a good 2nd.

Mr. Thomas Sowns, gr. to F. C. Birch, Esq., Clovelly, Winchester, had the best group of miscellaneous plants among three exhibitors, and also the best Ferns.

Mr. J. Gosney, gr. to Captain Mitchell, Winchester, won the 1st of Messrs. Suttons' prizes for a collection of vegetables with good produce.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

The above Society held their summer exhibition on the 2nd inst., in the beautiful grounds belonging to Lord Iveagh, near St. Stephen's Green. Notwith-

standing the backwardness of the season, and the late unfavourable weather, there was no lack of exhibits in every department. The Roses, especially those from Alexander Dickson & Sons, Newtownards and Belfast, were the chief centre of attraction. This well-known firm carried off all the leading prizes in the nurserymen's class, the judges awarding them the Society's Cup for the best forty-eight Roses, dissimilar; 1st prize for the best forty-eight Roses in twelve varieties; 1st prize for the best twelve Tea Roses; special 1st prize for a collection of a hundred Roses; 1st prize for the best thirty-six trusses of Pelargoniums. The Society's Cup for thirty-six Roses went to Lord Ashtown. Fruit was not well shown.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

[From our Special Reporter.]

THE 52nd Anniversary Festival of this Institution took place at the *Hôtel Métropole* on Wednesday evening under the presidency of the RIGHT HON. JOSEPH CHAMBERLAIN, M.P. A large number of gentlemen sat down to dinner, among them being Lord Stanley of Alderley, Sir John T. Dillwyn Llewelyn, Bart., Mr. Harry J. Veitch (Treasurer), Mr. N. Sherwood, Mr. Herbert J. Adams, and the Rev. W. Wilks.

The Chairman, who on rising to propose the toast of the evening, was loudly cheered, said:—My Lord and Gentlemen, I have now the pleasure of proposing "Continued success and prosperity to the Gardeners' Royal Benevolent Institution," now in its 52nd year, coupled with the name of Harry J. Veitch, Treasurer. Three years ago I was honoured with an invitation to be present at a similar gathering, but to my very great regret and at the last moment I was prevented by indisposition from putting in an appearance, and I confess I am thankful to the Committee for having given me another opportunity of performing what I regard as at once a privilege and a duty. I suppose that we may differ greatly upon many questions, but I think, at least I may assume, that we are all united in our interest and our love of horticulture, and under these circumstances I do not need to make any defence of our favourite pursuit. It has provided rest and brought happiness to many of the greatest and wisest in the land. Statesmen have found recreation in it; philosophers have commended it; doctors have prescribed it; lawyers have advocated it; and poets have sung its praises. The great Lord Bacon, who devoted one of his essays to the subject, said that the cultivation of flowers was the purest of human pleasures and the greatest refreshment to the spirit of man, and he did not think it at all beneath his dignity to leave behind most careful instructions as to the formation and planting of a perfect garden. But I venture to say that one of the greatest recommendations of our hobby in this democratic age, is that it is capable of affording delight to rich and poor alike, and that it can with the greatest ease be accommodated to the income of the millionaire or to the scanty pittance of the humblest labourer.

Another statesman—Sir William Temple—has written very truly that gardening is at once the pleasure of the greatest and the care of the meanest, and the cottage garden is capable of affording as much delight to its owner as the finest conservatory attached to the lordliest mansion. A new variety of *Auricula*, reared by the careful skill and the tender care of the village amateur is to him probably a source of as much pride and self-glorification as could be to another the most costly exotic or scarce orchid that ever was imported.

I claim, then, that the cultivation of flowers satisfies our love of natural beauty which is inherent in almost every human breast; that it cultivates intelligence and the powers of observation, and at the same time that it provides variety and excitement by the constant novelty which results from our attention. And while it does all these good things it is, I believe, the most unselfish of pleasures, for it is enjoyed most in the largest company, and unlike some other amusements to which the human race is prone, ours inspires no evil passions, inflicts no pain, and causes injury to no man, either in his health or in his estate.

Under these circumstances it seems to me a matter for congratulation to all of us that gardening in all its branches is daily increasing in popular favour and

attention. Never, I should think, before has the use of flowers as decorations been so lavishly and extensively employed. They may be said to accompany us from the cradle to the grave. They adorn our houses, they grace our banquets—and I may be allowed in passing to thank those who have provided so generously for the delectation of our eyes and for the gratification of our palates in the fruits and flowers which have been shown upon these tables. I say they adorn our houses, they grace our tables, they add a new charm to female loveliness, and they do something to relieve the repulsive ugliness of masculine apparel.

The interest which is felt in this pursuit is shown by the crowds which attend our great horticultural shows, and we see that thereby our principal growers are stimulated to new efforts; each favourite flower in turn is taken in hand, improved and perfected, while the uttermost corners of the globe are ransacked to find new beauties and new varieties. And in connection with all this enterprise there is a romantic side to horticulture which perhaps has hardly received the attention which it deserves.

Last year you all remember how the whole world felt a common interest in the recital of the difficulties which had been undergone and of the adventurous progress of the little band which penetrated through the darkest parts of Africa in search and in relief of Emin Pacha; but I venture to say that there are scores of modest explorers whose names are only known to the few, who undergo difficulties as great and encounter dangers as serious as those which were overcome by Stanley and his explorers, animated only by a love of science and a spirit of enterprise. The history of many flowers is a record of persistent and courageous achievement, carried out in face of extraordinary difficulty and labour. Unfortunately, this record has been made memorable by great sacrifices, by loss of health, and in some cases by loss of life. Horticulture has its heroes and its victims as well as war, and it behoves us to bear their names in respectful and admiring remembrance. But it is not only these adventurers who are always seeking fresh fields and pastures new who are deserving of our sympathy and gratitude. I have already quoted Sir William Temple. In another place he says, very truly, that in the growth of flowers success is almost wholly with the gardener, and I think it will be admitted that, without the constant care, intelligence, and industry of those who are primarily responsible, the most lavish expenditure and most perfect apparatus would be of little avail to secure satisfactory results.

How then shall we repay our debt to those who have in this respect, ministered to the pleasure and the interest of our lives? The profession of the gardener is a very interesting one, but at the same time I think we must allow that it is not too highly paid. The prizes are few, and the conditions of life are such that it is hardly possible even for those who are most thrifty and most industrious in the profession to make adequate provision for all the eventualities of life. I have thought that perhaps the most pathetic position in which a man could be placed was when one who has spent a long life in honest industry finds himself, as age approaches, with diminished capacities and with ever-declining resources, face to face with a future which has no bright spot, and to a future which offers to him only the prospect of the poor-house as a refuge for his old age. Recent enquiries have convinced me that this, unfortunately, is the condition of a much too large proportion of our working class population, and I have thought that the time has come when it is urgent that the State should intervene to remove what I think to be a blot and a scandal upon our civilisation. But in the meantime the worn-out veterans of our industrial warfare have their only hope in the operations of such societies as that for which I plead to-night. I commend to your generous support the principles of this Institution. Its object is the relief of the aged and the distressed. The subject of its bounty must have passed the age of sixty years, and must have spent twenty years of their life at least in a responsible position. Preference is given, as it ought to be, to those who have endeavoured to help themselves, to those who have been for a considerable time contributors to this institution, and relief is given in the best form in which it can be offered. The funds of the institution are not wasted in buildings and costly administration, but the whole of them are paid away, and the recipients are enabled, without breaking up their homes, to pass the remaining years of their life in comparative comfort amongst their

own relatives and friends. The institution has now lasted for more than half a century, and has had a career of continued and increasing usefulness and prosperity. At the present time, I learn, there are on the books 156 pensioners, male and female, and they are receiving the bounty of the society at a cost of something like £3000 a year. It only remains for me to appeal to you, and to appeal to all who have derived profit or pleasure from the gardener's skill, to assist this institution to meet the claims that may be made upon it, so that no deserving applicant shall be turned away, and so that all shall find relief in their time of need; and I feel sure that we shall all take a greater delight in our pursuit if we know that those who have grown grey in its service will not suffer want or dishonour in their declining years. My Lord and gentlemen, I propose this toast, and I couple with it the name of Mr. Harry Veitch—a name which, as well for his own merits, as for the services which have been rendered by members of his family through a long course of years, will ever be honoured in horticulture.

Mr. Harry Veitch, in response to the toast, at the outset, thanked the chairman for the admirable way in which he had advocated the interests of the institution, and remarked that what they heard would find, not only an echo, but a resting place in the hearts of every one present. He did not, he went on to say, propose to go into figures that evening, but he would like to say that since their last meeting their oldest pensioner had passed away at the age of 103 years. That pensioner had subscribed to the funds 15 guineas, and since the time he became a pensioner he had received from the Institution no less than £520. That, he thought, would show the advantage of any gardener becoming a subscriber to the Institution, and if, in God's providence, he never needed such assistance, he would always feel glad that he had been able to help others who had been less successful than himself.

Mr. Veitch next touchingly alluded to the losses they had sustained in the death of Mr. B. S. Williams, one of the best supporters of the Institution; Mr. Shirley Hibberd, who was always ready to do all he could in the good cause; Mr. Richards, who was a member of the committee; Mr. Deal, Mr. Backhouse, of York, and many others; and he paid a high tribute to the memory of Mr. Roger Cutler, who had been their Secretary for fifty years, and who had worked so long and nobly for the Institution.

Mr. N. Sherwood proposed "The President and the Vice Presidents," to which Mr. Herbert J. Adams responded.

Sir John T. Dillwyn Llewelyn, Bart., proposed "The Royal Horticultural and Botanic Societies of London and the United Kingdom." He said he trusted that the effect of that gathering would do a great deal in the interest of thrift, and bring together all classes of gardeners throughout the kingdom, because their old servants were men whom whom they ought never to overlook. He held that all should join the Society—both employed and employers—for the general good.

The Rev. W. Wilks, in responding, after alluding to the eloquent speech from Mr. Chamberlain went on to allude to the change that had come over the society during the past few years. He said, up to 1887 the society was certainly drifting in a direction of which they, as horticulturists, did not exactly approve. It was drifting into the direction of a mere pleasure garden for the inhabitants of South Kensington and its neighbourhood, and that was not a direction which a great scientific society like theirs ought to occupy. Since that time a great change had come over the Society, principally through the action of the Fellows of the Society itself. The Council felt that the Society's work was not being done in a proper way, and they wished for a reform—and a reform was brought about in the year he had mentioned. The Society had to struggle with considerable difficulties—with debt which was left upon them, with the burden of obsolete but still binding laws and rules. They had to struggle with a still greater burden—and here he did not want to be misunderstood—they had to struggle on with a burden, financially speaking, and only financially speaking, because burdens in many cases were great pleasures—but expensive pleasures. They had to bear the burden, a very pleasurable one, but a very costly one, of a number of life fellows subscribing nothing to the funds of the society. They were gentlemen whom the society welcomed most heartily, most cordially, but yet they entailed upon the society a very considerable expense, as with the

exception of a few generous members the Society received absolutely no subscriptions whatever from them since South Kensington was given up. For his own part he did not in the least mind any comparison being made between the state of the Society in 1887 and 1891. He could not say much about the Royal Botanic Society as he was one of those who minded their own business. He was glad the kindred Societies were doing good work in the towns and villages of England, and that many of them were becoming affiliated to the Royal Horticultural Society.

Lord Stanley, of Alderley, proposed the health of the Chairman.

The Chairman in reply said:—"It has been, as I said in my former remarks, a pleasure and a duty to be present amongst you. I claim to be one of you, because I have taken great interest in gardening now for thirty years, and during that time I have grown—or I have attempted to grow—everything, from Dandelions to Orchids, and I chiefly pride myself upon Dandelions. But I can assure you that in my devotion to this pursuit I have had my reward. I believe that it is impossible for anyone to find more healthful, delightful recreation or a greater change from care and anxiety than is to be found in the pursuit of gardening. During all this time—or at least during my later years—my business has been the business of the politician and my pleasure has been the pleasure of the gardener. I sometimes think that a parallel and an analogy might be drawn between the two pursuits. The progress of idea, and the growth of flowers, have something in common—they both require ventilation. I do not think the parallel ends there, for it is certain that they very often succeed best in heat. Then, as you know, we gardeners are troubled greatly by destructive proceedings on the part of obnoxious insects, that we know by the names of thrip, red-spider, mealy-bug, and orchid-devil. Well, gentlemen, if you have read your newspapers, you must be aware that we politicians are also troubled by insects, although I should be sorry to mention their names. I don't doubt that you will be able to supply them. Well, gentlemen, you will readily understand that, having derived so much advantage and pleasure from this pursuit, I am delighted to have an opportunity, however humble, of providing in some measure for those who are also engaged in it, but under less fortunate circumstances. I thank you very much for the compliment you have paid me.

During the evening the Secretary (Mr. Ingram) announced subscriptions to the amount of £1,450, including 50 gs. from the Chairman and 10 gs. from Mrs. Chamberlain; 10 gs. from Lord Stanley of Alderley; £20 from the Duke of Westminster; £100 from Messrs. Rothschild & Son; £50 from Mr. W. H. Salt; £30 from Baron Schroder, and £20 from Messrs. Veitch & Sons. The music was under the direction of Mr. Herbert Schartau, who was assisted by Miss Ethel Bevans, and the Meister Glee Singers, Mr. W. Sexton, Mr. Gregory Hast, Mr. W. G. Forington, and Mr. Webster Norcross.

TRADE NOTICE.

MR. J. BAILEY, for the past five years gardener to Sir John E. Dorington, Bart., M.P., Lypiatt Park, Stroud, will resign the charge of these gardens on August 8, he having taken over a florist business at Brighton on his own account.

AMERICAN FRUIT EVAPORATOR.

THE growing and storing of fruit in a convenient form has advanced in America, and on the continent, to a stage beyond the jams, jellies, and syrups of our own country; and various fruits are tinned, or dried for future use, which we, in our old wasteful style, dispose of at ruinously low prices, owing to a glutted market, or allow to go to waste. Fig. 8 shows an apparatus that will dry for future use, sliced Apples, good windfalls, or slightly unsound fruit; Plums, Cherries, Apricots, &c. There is an iron stove, lined with fireclay, and resting on this is a long (10 feet) box, divided longitudinally into an upper and a lower story.

The fruit to be dried is placed in a single layer, on wire trays with a wooden frame, about 2 feet

square. These trays are placed in the drying boxes, and in the lower division first; and after a tray has remained, just within the opening, so long as it would take to get another tray of fruit ready, it is pushed further on by inserting a tray in front of it, and so on, and by the time the tray has reached the

FIG. 8.—FRUIT EVAPORATOR.

upper end, the fruit in it is sufficiently dried for removal. If it is not done enough, it is put in at the lower end again, this time in the upper division, and pushed on as before. It is a very simple affair, and requires only a little practice to enable anyone to turn out perfectly good dried fruit that will keep for years in an ordinary room.

The apparatus was to be seen at the recent Strawberry Conference, at Chiswick, at work, under the direction of Mr. E. Badger, and a competent practical operator.

THE STRAWBERRY LEAF-DISEASE.

IN some gardens the Strawberry leaves are annually infested more or less by a fungus *Sphaerella Fragariae*, a kind of leaf-blight. This blight first appears on the leaves about the time of the setting of the fruit; and if the weather be dry and warm, it makes rapid progress.

FIG. 9.—DISEASE OF STRAWBERRY LEAVES.

A full description of the fungus, and its mode of existence will be found in the *Gardeners' Chronicle*, p. 798, June 28, 1890.

The remedy for this fungus is twofold, (1) to use in summer 3 oz. carbonate of copper dissolved in 1 quart of water, which should be diluted to 20 gallons; and (2), the destruction of the old leaves by burning in spring.

GARDENERS' ORPHAN FUND ROSE FETE.—Messrs. JAMES CARTER & Co. are granting a half-holiday to all members of their staff who take tickets on Wednesday next, and no doubt other London houses will not be slow to imitate their example.

THE LARGE VINE AT CUMBERLAND LODGE.—Cumberland Lodge, which has formed so large a feature in the ceremonials of the past week, is horticulturally considered, of most interest on account of the large Vine, of which we give an illustration at fig. 5, p. 41, and concerning the history of which interesting details will be found in our volume for 1874 (*Windsor Supplement*), p. 688.

PORTSMOUTH HORTICULTURAL SOCIETY.

JULY 1.—One of the best shows yet held by the Portsmouth Society was that of the above date, in Victoria Park. The competition in most of the classes was exceedingly keen.

Plants formed the most important part of the show, good prizes being offered. The principal class was that for twelve stove or greenhouse, not less than six to be in flower; Mr. Cypher, Cheltenham, gained the leading prize by the superior quality of his flowering plants; Mr. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, Sussex, was a good 2nd.

In a corresponding class for four plants, no less than seven competed, Mr. Cypher again led, Mr. F. Mould, Pewsey, Wilts, 2nd.

Specimen Palms were well shown by Mr. Offer, who took premier award for three, and for one, with healthy plants of choice kinds. Mr. Offer was the most successful with Exotic Ferns.

In the class for one specimen flowering plant, Mr. Mould won, staging a very fine *Erica retorta* major. Mr. Cypher had *Dracophyllum gracile*, in good condition, for 2nd prize. Mr. Offer, with *Croton interruptum*, in superb condition, easily won 1st for specimen foliage plants; Mr. Currey, gr. to Colonel Pepper, Milford Hall, Salisbury, 2nd, showing a healthy *Cycas revoluta*.

The best dinner-table plants were sent by Mr. Wills, florist, Shirley. Such plants as Begonias, Fuchsias, Coleus, Geraniums, &c., were staged in large numbers, the principal prizetakers being Mr. Hatch, Superintendent, Victoria Park, Portsmouth; Mr. Burridge, North End Nursery, Portsmouth; and Mr. Penford, gr. to Sir F. Fitzwygram, Bart., Leigh Park, Havant.

Groups arranged for effect were extremely good, showing much taste. The 1st prize went to Mr. Wills, for a very pretty arrangement, showing none of the overcrowding so often seen; Mr. Currey, 2nd. In a smaller class there was even stronger competition, Mr. Burridge and Mr. Hatch taking the awards in the order here given.

Cut flowers were extensively staged. Mr. Penford had the best stove and greenhouse kinds, Mr. Ladhams the best hardy varieties—both good, were contributed by the Rev. W. Shirley, Southwick Parsonage, of good quality. Messrs. Perkins & Son, Coventry, were the prizetakers for bouquets.

Fruit, although not extensively exhibited, was good in quality. For six dishes, Pines excluded, Mr. Inglefield, gr. to Sir J. Kelk, Bart., Ledworth, Marlborough, was an easy 1st, he having really good Black Hamburg Grapes, Royal George Peaches, Seedling Melon, and very fine Sir J. Paxton Strawberries. For three bunches Black Grapes, Mr. Tavener, gr. to Sir A. K. Macdonald, Liphook, easily secured leading honours with Black Hamburg, Mr. Penford won easily in the white class, staging Golden Hamburg, better than it is generally seen—in fact, seldom is this variety found in such a bright condition.

Mr. Penford won in both Melon classes, showing good fruits. Peaches were best staged by Mr. Inglefield, Nectarines by Mr. Penford, and Strawberries—a fine dish of Sir J. Paxton—by Mr. T. Hall, gr. to S. Montagu, Esq., M.P., South Stoneham House, Southampton.

Vegetables were well shown. For nine varieties, Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Henstridge, easily won, with produce good in every respect. Mr. G. B. Woodward, Liphook, Hants, had the best Cucumbers and Tomatos in the classes set apart for them.

Mr. Ladhams staged a fine lot of herbaceous cut flowers, not for competition; as also did Mr. M. Prichard, Southbourne Nursery, Christchurch, which, along with the Roses sent by Messrs. Keynes, Williams & Co., Salisbury, and Messrs. Ewing, Havant, considerably attracted the general public.

Obituary.

H. J. BUCHAN, ESQ., J.P.—By the death of this esteemed horticulturist, which took place at Southampton on July 1, the south of England has been deprived of one of its best garden patrons. Whilst devoted to gardening generally, the deceased gentleman was an enthusiastic orchidist, and his collection of Orchids before its dispersal had become, under the care of his late gardener, Mr. Osborne, one of the best in the district. Perhaps it is not saying very much, after all, because it unfortunately happens that Orchids do not form a very prominent element in horticulture in the neighbourhood of Southampton. Mr. Buchan had, perhaps, the best, and its dispersal recently was an undoubted loss to the local horticultural exhibitions. The late Dr. Ward, of Southampton, also had a collection which long since went the usual way; and perhaps just now the best collection is to be found at Moor Hill, Bitterne, under the care of an enthusiastic orchidist, Mr. N. Blandford. Mr. Buchan was in life a warm and active supporter of the Southampton Horticultural Society, was also a Fellow of the Royal Horticultural Society, and very frequently came to London on purpose to see its shows, and look up the various Orchid collections about the metropolis. He was a justice of the peace for the town, had often held high office, including that of mayor in 1872, also in the corporation, and was in every sense an estimable gentleman. Braving popular prejudice, he ordered that his body should be cremated, which was duly performed at Woking on Tuesday last, after which the urn enclosing the ashes was taken back to Southampton, where the following day it was deposited in the family tomb in the cemetery with full funeral honours.

MARKETS.

COVENT GARDEN, July 9.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day but often several times in one day. Ed.]

Good business doing. Supply equal to demand. Outdoor Strawberries in heavy supply. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON, July 9. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that to-day's market thinly attended, and presented no feature of interest or importance. Quotations, consequently, in the absence alike of either any speculative or consumptive demand, exhibited no alteration. Clover seeds are altogether neglected. Full prices are asked for both Mustard and Rapeseed. For bird seeds the sale is slow at former rates. Large blue Peas are exhausted. Feeding Linseed keeps steady.

FRUIT AND VEGETABLES.

SPITALFIELDS: July 7.—Quotations:—New Zealand Apples, 5s. to 7s. 6d. per box; English Tomatos, 6s. to 8s. per 12 lb.; foreign do., 1s. 3d. to 1s. 6d. per box; natural Rhubarb, 1s. to 2s. per doz. bundles; Gooseberries, 3s. to 3s. 6d. per half-sieve; white Cherries, 7s. 6d. to 9s. do.; Strawberries, 1s. 6d. to 2s. 6d. per peck; Seakale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. 6d. to 3s. 6d. per tally; Greens, 1s. 2d. to 1s. 6d. per dozen bunches; Spinach, 6d. to 1s. 6d. per bushel; Turnips, 3s. to 4s. 6d. per dozen bunches; Cauliflowers, 3s. 6d. to 5s. per dozen; Peas, 3s. to 3s. 9d. per bushel; do., in sacks, 3s. to 5s. 6d. per sack; Carrots, 2s. to 3s. 6d. per dozen bunches; Endive, 1s. to 2s. 6d. per bundle; Cos Lettuce, 8d. to 1s. 2d. per score; Cabbage do., 6d. to 9d. per dozen; Onions, 3s. to 1s. 6d. per dozen bunches; Egyptian do., 7s. 9d. to 8s. per cwt.; Parsley, 1s. to 1s. 9d. per dozen bunches; Horseradish, 1s. to 1s. 2d. per bundle; frame Cucumbers, 2s. to 3s. per dozen; natural do., 1s. to 1s. 6d. do.; Mint, 2s. to 2s. 6d. dozen bundles.

STRATFORD: July 7.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 1s. to 3s. per tally; Greens, 6d. to 8d. per bag; do., 6d. to 1s. per dozen bunches; Carrots, household, 2s. 6d. to 3s. 6d. per dozen bunches; Mangels, 30s. to 35s. per ton; Onions, Egyptians, 120s. to 150s. do.; Green Peas, 3s. 9d. to 5s. 6d. per bag; Strawberries, English, 2s. 3d. to 2s. 9d. per peck.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending July 4, and for the corresponding period last year:—1891, Wheat, 38s. 9d.; Barley, 26s. 9d.; Oats, 21s. 1d. 1890, Wheat, 32s. 8d.; Barley, 22s. 6d.; Oats, 19s. 10d. Difference, Wheat, +6s. 1d.; Barley, +4s. 3d.; Oats, +1s. 3d.

POTATOS.

SPITALFIELDS: July 7.—Quotations:—New Jersey rounds, 7s. 6d. to 8s. per cwt.; do. kidneys, 9s. to 10s.; do. flukes, 9s. to 10s. 6d.; Cherbourg rounds, 7s. to 7s. 6d.; do. kidneys, 8s. 6d. to 9s.; do. flukes, 9s. to 9s. 6d.; St. Malo rounds, 6s. 6d. to 7s.; do. kidneys, 8s. to 8s. 6d. per cwt. Old: Magnums, 100s. to 110s.; Imperators, 100s. to 110s.; Bruce Magnums, 100s. to 110s. per ton.

BOROUGH: July 7.—Quotations:—New: Jerseys, 10s. to 11s.; Cherbourg flukes, 9s. to 10s.; do. rounds, 7s. to 8s.; St. Malo rounds, 7s. to 9s. per cwt. Old: Magnums, 100s. to 140s. per ton.

STRATFORD: July 8.—Quotations:—Old: Magnums, 110s. to 130s. per ton. New: Jersey flukes, 9s. 6d. to 10s. 6d.; Cherbourg, 8s. 6d. to 9s. 6d.; do. rounds, 8s. to 8s. 6d.; Bordeaux, 7s. 3d. to 7s. 9d.; St. Malo flukes, 8s. 6d. to 9s.; do. rounds, 7s. 6d. to 8s. per cwt.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 102s. 6d.; inferior do., 40s. to 75s.; hay, best, 60s. to 87s.; do., inferior, 26s. to 50s.; and straw, 29s. to 32s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 32° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N. 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 4, is furnished from the Meteorological Office:—

"The weather has been in an unsettled condition very generally, with frequent falls of rain and occasional thunderstorms. In most parts of the kingdom, however, and especially over the east and south of England, there were considerable intervals of fine bright weather.

"The temperature has continued a little above the mean over the greater part of England and Scotland, as well as in 'Ireland, N.,' and the 'Channel Islands.' In the 'Midland Counties,' 'England, N.W.,' 'Scotland, W.,' and 'Ireland, S.,' it has just equalled the normal, while in 'England, S.W.,' it has been 1° below. The highest of the maxima, which were recorded either on June 28 or 29, ranged from 77° in 'England, S.' (in London), and 76° in 'England, E.,' and the 'Channel Islands,' to 68° in 'Scotland, N.' The lowest of the minima were generally registered on July 4, and ranged from 40° in 'Scotland, N.,' and 42° in 'Scotland, W.,' and 'Ireland, S.,' to 47° in 'England, N.W.,' and to 54° in the 'Channel Islands.'

"The rainfall has been more than the mean over Ireland, the south-west of England, the 'Channel Islands,' and the north and east of Scotland, and equal to the mean in 'England, N.W.' In all other districts, however, there has been a slight deficit, although at some isolated stations the fall has been rather large.

"The bright sunshine shows a considerable decrease, and has been below the mean in the north and west of Scotland, as well as in the south-west of England and the greater part of Ireland. In most of the English districts it has exceeded the mean. The percentage of the possible amount of duration ranged from 55 in the 'Channel Islands,' and 50 in 'England, S.' to 27 in 'Scotland, W.,' and to 13 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

BEECH AND LIME: S. The leaves are swarming with insects allied to the greenfly and to the American blight—*Psylla fagi*. The Limes are attacked by the larvæ of the Brindled Beauty Moth. See *Gardeners' Chronicle*, August 2, 1890, p. 143.

BOOKS: *W. P. Composition, Price, and Mode of Application of various Manures*. Published by the Agricultural and Horticultural Association, Ltd., 3, Agar Street, Strand, and Creek Road, Deptford. — *Young Beginner. The Kitchen and Market Garden*. (London, Macmillan & Co.) — *The Forcing Garden*, by Samuel Wood. (London, Crosby Lockwood & Co.) — *J. W. C. Select Ferns and Lycopods*, by B. S. Williams, published and sold by his son, Victoria and Paradise Nurseries, Upper Holloway, London, N. — *Wildflower, British Flora*. Bentham and Hooker. (L. Reeve & Co., Henrietta Street, W.C.) — *Handy Book of the Flower Garden*. D. Thomson. (Blackwood & Sons.) — *A. G. Bower & Vine's Practical Botany* (Macmillan). — *Oliver Lessons. Masters' Botany for Beginners*. (Bradbury, & Agnew Co.),

BOUQUET-HOLDER: K. O. B. Any horticultural sundriesman. They do not cost much, price varying according to size, materials, and workmanship.

CINERARIA: J. F. L. Injured by a leaf-miner. Search for the burrowed leaves, squeeze or prick the grub, if the injury has only just commenced; but cut off and burn them if they are much traversed by the grub.

CUCUMBERS DYING OFF: W. G. The plants are doubtless suffering from eel-worms at the roots. Kindly send specimens.

CUCUMBERS: S. W. L. Eel-worms probably—there is no known cure. Rout them out and the soil as well, and commence with plants and soil from a clean source. We shall probably illustrate the eel-worm disease next week.

FUNGUS ON LILIA: W. White. *Uredo Lynchii*, B., figured in *Gardeners' Chronicle*, May 30, 1885.

FUNGUS IN MUSHROOM-BED: R. C. H. An immature state of a fungus called *Xylaria vaporaria*, often described in the *Chronicle*.

MOSS: K. O. B. If you mean *Selaginella denticulata* or *S. apoda*, peg down little bits on a thin layer of manure, loam, and sand, and keep close for ten days. Common moss may be taken up in thick layers, soil and all; but it must not be kept as a tender plant.

NAMES OF PLANTS: *Adolescens*. 1, *Sidalcea malviflora*; 2, *Lychnis viscaria*; 3, *Helenium grandiflorum*; 4, *Pentstemon ovatus*; 5, *Verbascum pbniceum*; 6, *Aquilegia vulgaris*, form of; 7, *Iris*—cannot name without flowers.—*Homestead*. *Aristolochia Siph.*—R. H. B. 1, *Ceanothus azureus*; 2, *Chenopodium album*; 3, *Veronica Buxbaumii*.—R. H. S. One of the many varieties of evergreen Oak, *Quercus Ilex*.—J. W. C. 1, Indeterminable—too young; 2 and 3, *Lastrea filix-mas*; 4, *Aspidium spinulosum*, probably, but too young; 5, *Aspidium spinulosum*; 6, *Polypodium*

vulgare var.; 7, probably *spinulosum*, but specimen too young.—L. S. *Aralia (Dimorphanthus) spinosa*. This plant is sometimes killed in very severe winters, if the root be not protected with bracken, leaf-mould, or the like.—G. H. P. *Alchemilla alpina*.—G. S. *Bupleurum rotundifolium*, an Umbellifer not an Euphorbiad.—J. S. 1, *Staphylea pinnata*; 2, *Alchemilla vulgaris*; 3, *Spiræa filipendula*, double; 4, *Polygonum persicaria*; 5, *Valeriana* sp.; 6, *Digitalis lutea*; 7, *Thalictrum flavum*; 8, *Carex*; 9, *Cratægus Crusgalli*; 10, *Centranthus ruber*.—W. T. *Galeopsis versicolor*.—C. K. G.—1, *Allium Moly*; 2, *Epilobium angustifolium*; 3, not found; 4, *Tradescantia virginica*; 5, *Iibiscus syriacus (Althæa frutex)*; 6, *Spiræa aruncus*.—A. C. H. 1, *Viburnum opulus*; 7, *Staphylea pinnata (Bladder-nut)*.—G. W. 1, *Ballota nigra*; 2, *Vicia sylvatica*; 3, *Funkia ovata*.—O. W. G. *Rose Maréchal Niel*, apparently.—W. N. *Hierangea paniculata grandiflora*. 1, *Caesia occidentalis*; 2, *Brassia verrucosa*; 3, *Gongora galeata*.—Miss F. *Cestrum aurantiacum*. X. Y. Z. 1, *Polemonium cœruleum*; 3, *Sedum Fosterianum*; 4, *Dianthus deltoides*; 5, *D. glaucus*; 6, *Sedum oppositifolium*; 7, *Gypsophila prostrata*; 8, *Lomaria alpina*.—E. W. *Saxifraga hypnoides*.—H. P. F. *Adiantum fragrans*; *Cyrtotium Fortunei*, probably.—T. B. 1, *Geranium lancastriense*; 2, *Geranium sanguineum*; 3, *Lamium maculatum*; 4, *Hieracium aurantiacum*; 5, *Asperula odorata*.—N. J. H. 1, *Scirpus silvatica*; 2, *Bromus mollis*; 3, *Festuca ovina*; 4 and 5, varieties of *Agrostis vulgaris*.

PANSIES: K. O. B. Grow the plants on a north border. It should be well manured and deeply dug. They may be seedlings or cutting-raised plants. August is rather late to have good blooms. For exhibition, the following may be employed:—Abdul, Blue Stocking, Boreas, Bon, Catulus, Hebe, Hyperbolus, Janus, Juno, Mars, Orpheus, Proteus.

POPPY: J. H. Withered when we received it; but apparently it is a seedling from the common field Poppy, *Papaver Rheas*. It would be worth fixing, if you could have patience to do so.

STRAWBERRIES: N. There is a great difference between the composition of wild and cultivated Strawberries. The amount of water is about the same in both, say about 87 per cent. of water, but while in the wild form there is 3 to 4 per cent. of sugar, in the cultivated varieties the sugar runs up to 7.5 per cent. The free acid is about the same in both, 1 per cent., or a little over. The nitrogenous substances are greater in proportion in the wild than in the cultivated forms. Hence, looked at as food, Strawberries take very low rank.

MARK SMITH, MANUFACTURING CHEMIST, LOUTH, LINCOLNSHIRE.

THE STOTT PATENT DISTRIBUTOR, PATENT SPRAYER, PATENT SYRINGE. KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillars and all Insect Pests, and Prevention of Mildew.

Crosswood Park, Aberystwith, S. Wales.

Sirs,
July 7, 1890.
Thanks to your "Stott" Distributor, our Wall trees and Roses were never cleaner than at the present time. We have a long border of Roses, about 150 yards long, and one filling of the Distributor with "Killmright" will cleanse them thoroughly. I have been asked by many how the Roses are so clean, and I at once told them to get one of the "Stott" Insecticide Distributors, and join to their hose, and they will soon find the benefit. I have used it all round the walls, and it has cleansed everything. I think it a very useful invention, and shall recommend it to all my friends.—I remain, yours truly,
R. C. WILLIAMS.
Gardener to The Earl of Lisburne.

Retail from Ironmongers and Seedsmen, Wholesale and Retail from the Stott Distributor Co. Ltd., Barton House, Manchester.

TRADE MARK.

FOR PLANTS.

QUICK. LASTING. ECONOMICAL.

The Gardens, Seacroft Heath, Hawkhurst, Kent, March 11, 1891.
DEAR SIR.—Having used your "Clay's Invigorator" for some time, I am exceedingly pleased with the results obtained from it. As an Exhibitor I have used it upon many sorts of Vegetables with great advantage; also upon many sorts of Stove and Greenhouse Plants, Melons, Cucumbers, Tomatoes, Pot Strawberries, Chrysanthemums, &c. For Lawns it has a quick and beneficial effect. For Amateurs and those with small gardens, where there is a difficulty in obtaining stable or farmyard manure, your "Invigorator" ought to be of special value, as it is clean in use, easy of application, and reasonable in price.—Yours respectfully,
J. GILMOUR, Gardener to the Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the Works, in 6d. and 1s. Packets, and SEALED BAGS:—

7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs.
2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of ONE SHILLING by the MANUFACTURER—

"ADIES" LAWN EDGER
OR
AUTOMATIC SHEARS,

AWARDED (after trial) Hanksian Medal and Certificate of Merit of the Royal Horticultural Society.

THIS INVENTION consists of a pair of Shears, attached to a small roller, which work automatically, and will cut the grass edges as fast as it is possible to push the machine along.

"We know not which to admire most, its simplicity or efficiency. It is as great an advance on the old Shears as the Lawn Mower was over the Scythe."

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to **A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.**

N.B.—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER.**

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 35s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to **A. G. MARTIN.**

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

HILL & SMITH'S
BLACK VARNISH

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

BREAKFAST OR SUPPER.

GARDENING APPOINTMENTS.

MR. E. FRANCIS, as Head Gardener to J. L. NEWALL, Esq., Forest Hall, Ongar, Essex.

MR. HENRY PAGE, until lately Foreman under Mr. McLEWICK, for eight years at New Lodge, Windsor Forest, as Head Gardener to HOWARD VISE, Esq., Stoke Place, Slough, Bucks.

MR. A. FRENCH, formerly Foreman for nine and a half years at Halton Gardens, Tring, Herts, has been appointed Gardener to B. V. MELVILLE, Esq., Ford Manor, Lingfield, Surrey.

WANTED, IMMEDIATELY, a really good and competent all-round Man as WORKING PROPAGATOR, GROWER, and HEAD GARDENER in a Private Place, where the produce is sold. Must be well up in Growing and packing for Sale, and able to produce a good quantity of Cut Blooms, Cucumbers, Tomatos, Mushrooms, &c. Private Gardeners need not apply unless they have previously held similar appointments. Preference given to a married man without encumbrance. Applicant must be a good disciplinarian with undermen, and character to bear the strictest investigation as to industry, honesty, sobriety, and regularity. Wages 30s. per week, and house.—Apply, by letter only, to HORTICULTURE, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD-WORKING GARDENER, a good practical all-round man, inside and Out.—Middle-aged; married; no family preferred. Must have good testimonials. Two others kept. There is a good lot.—Send full particulars, wages expected, &c., to R. M. T., Elmfield, Hertford, Herts.

WANTED, about August 1, a GARDENER.—Young, unmarried, well trained. Must be able to Milk, and at end to Cows, &c.; handy, and willing to be generally useful. Wages from 21s.—Write fully to RECTOR, Tendring, Colchester.

WANTED, a HEAD GARDENER.—Age 40 to 45, married, no family. Strong in all branches of Gardening. Three men under him. Cottage, partially furnished. Address, stating full particulars, A. B. C., Langham Hotel, London. If in person, before 11 a.m.

WANTED, a SINGLE-HANDED GARDENER, for Kitchen Garden, Stove-house, &c.—No Vines. Also to look after pony.—Write stating wages, to A., Larchwood, Horley, Surrey.

WANTED, a steady GARDENER, must thoroughly understand Kitchen Garden routine and Pleasure Grounds. Wages 17s. Good House and Garden.—Colonel BENVENUE, Stakeley Hall, Huntingdon.

WANTED, for a Gentleman's small place, 10 miles from London, a SINGLE-HANDED GARDENER, not under 30; married.—One who is accustomed to grow Tomatos, Strawberries, and Cut-blooms for market: all Surplus Stock to be sold with commission. A good character from last place indispensable.—Apply, C. S. C., Queenwood, Black Fen, near Eltham, Kent.

WANTED, a GARDENER and his WIFE, without family. Gardener must be a good, all-round man; wife to take entire charge of Dairy and Poultry. Will be required to take charge of House in absence of family.—Address, stating experience and wages required, to R., Mrs. Wade, 98, High Street, Kensington, London, W.

WANTED, MAN and WIFE without encumbrance, as GARDENER and COOK for Gentleman's Country Cottage in Surrey. Man must thoroughly understand Kitchen and Flower Gardens, and have some knowledge of Orchids.—Write stating ages, wages, and full particulars to VEVEY, 40, Seething Lane, London, E.C.

Gardener and Baker.

WANTED IMMEDIATELY, for a Reformatory Farm School near Warrington, a married MAN, without family, to act as GARDENER and BAKER; Wife to act as LAUNDRESS. Wages, 30s. per week, with house and other allowances. A total abstainer, with good references, essential.—Address GARDENER, Messrs. Lee & Nightingale, Advertising Agents, Liverpool.

STOKER, or General Work in Nursery.—Age 22, married. Good character.—A. CANFIELD, 16, Abbey Road, Bexley Heath, Kent.

HOLLOWAY'S PILLS and OINTMENT.—The most effectual Cure for Gout and Rheumatism.—A frequent cause of these complaints is the inflammatory state of the blood, attended with bad digestion, lassitude, and great debility, showing the want of a proper circulation of the fluid, and that impurity of the blood greatly aggravates these disorders. Holloway's Pills are of so purifying a nature that a few doses taken in time are an effectual preventive against gout and rheumatism, but any one that has an attack of either should use Holloway's Ointment also, the powerful properties of which, combined with the effect of the Pills, ensure a certain cure. The Ointment should be thoroughly rubbed into the parts affected at least twice a day, after they have been sufficiently fomented with warm water to open the pores to facilitate the introduction of the Ointment to the glands.

ORCHID HOUSES—AS THEY SHOULD BE.

J. WEEKS & CO. give their special attention to the proper construction of Houses, in which to produce these beautiful flowers, and use only the latest improvements in Ventilation, Heating, and Forms of Stages. The drip of condensation from the roof-bars is successfully provided against.

SALES BY AUCTION.

Friday Next.
CATTLEYA AUREA.
LELIA PRÆSTANS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and 213, Park Road, Clapham, S.W., to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, July 24, at half-past 12 o'clock, a remarkable good lot of Cattleya aurea, brought home personally by the collector; the plants were collected in the same locality, whence came the plants we had the two previous years, and which turned out such an exceedingly fine lot, amongst which flowered C. aurea marmorata, C. Massiana, C. Harlyana, and other magnificent varieties. Many good things may be expected out of this importation. We can assure intending buyers the plants are well-leaved, and without doubt the finest ever offered.

Also a very healthy lot of LELIA PRÆSTANS, CATTLEYA WALKERIANA, C. SCHOPFELDIANA, ODONTOGLOSSUM POLYXANTHUM, well-grown plants, in spike; out of the same batch we have flowered some of the most beautiful varieties ever seen. ODONTOGLOSSUM RAMOSISSIMUM, a pretty winter-blooming Orchid; there are a grand lot, ONCIDIUM ROGERSI, fine plants, in unusually good condition; CATTLEYA LODDIGESII, newly imported, just received in first-class condition. HOPELLEIA Species, new, in bud, discovered recently by one of our collectors, and said to be of great beauty, the erect spike carrying eight to twelve large, well-coloured flowers. ZYGOPETALUM GRAMMIFOLIUM, a pretty dwarf species, growing on a stem of a Lomaria, flowers deep green, with chestnut and white; figured in the *Botanical Magazine*, t. 5045. COLAX JUGOSUS, well-grown plants; CATTLEYA LOBATA, ONCIDIUM WELTONI, established plants; ODONTOGLOSSUM HARRYANUM, in bud; CATTLEYA LEOPOLDI, in bud or flower; MASDEVALLIA POLYTRICHA, in flower; ONCIDIUM PHYMATOCILLIUM, O. MICROPOGON, ODONTOGLOSSUM ROEZLI, O. VEXILLARIUM, &c.

On view morning of Sale, and Catalogues had.

Friday Next.
BRASSAVOLA DIGBYANA.
CHYSIS BRACTEOSENS.

A Grand Lot. By order of Messrs. F. Horsman & Co.
MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on FRIDAY NEXT, July 24.

On view Morning of Sale, and Catalogues had.

Tuesday, July 28.

400 PHALENOPSIS GRANDIFLORA.
Best Java variety.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, July 28, at half-past 12 o'clock, an importation of 400 Plants of the best Java variety of PHALENOPSIS GRANDIFLORA, just received in excellent condition.

On view the morning of Sale, and Catalogues had.

Tuesday, July 28.—Orchids in Flower.

MESSRS. PROTHEROE AND MORRIS beg to announce that their next SPECIAL SALE of ORCHIDS in FLOWER will take place as above, and they will be glad to RECEIVE NOTICE of ENTRIES as EARLY AS POSSIBLE.

200 EASTER BERMUDE LILIES.
LILUM HARKINSI, in magnificent Bulbs.
Just to hand from Bermuda.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, July 28, at half-past 12 o'clock, a special importation of splendid Bulbs of the true EASTER LILY of BERMUDE. To those desirous of having this beautiful Lily in flower early in the season, this importation is of special importance, the bulbs being the finest ever imported; all very heavy and plump, and sure to bloom magnificently. Also 1000 Bulbs of the bright SCARLET LILY, LILUM POMONIUM.

On view morning of Sale, and Catalogues had.

Friday, July 31.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY, July 31, at half-past 12 o'clock, by order of Messrs. Seeger & Tropp, a large selection of well-established, clean, and healthy ORCHIDS, embracing

FIVE NEW ORCHIDS,
EIGHTEEN EXTREMELY RARE ORCHIDS,
and a great number of other
CHOICE SELECTED ORCHIDS.

Also

An Importation of BRAZILIAN ORCHIDS, ex s.s. "La Plata," just arrived in superb condition; together with other importations of EAST INDIAN ORCHIDS of value, the whole of which will be offered, with few exceptions, WITHOUT THE LEAST RESERVE.

On view morning of Sale, and Catalogues had.

Rare and Valuable Orchids.

MR. RICHARD PFAU has entrusted me with the sale of the following rare and valuable ORCHIDS, collected by him in Costa Rica, all of which are now offered in perfectly established plants, viz.:

BARKERIA ELEGANS, nice plants, 5s. each.
ODONTOGLOSSUM KRAMERI.—According to Collector, this very distinct and beautiful species will always remain scarce, being very rare in its native country. Nice plants, of flowering size, 30s. each; fine strong plants, 105s. each.
ODONTOGLOSSUM OERSTEDI MAJUS.—This very distinct and fine variety has larger flowers, and several flowers on each spike, much superior to type. Fine plants, 5s. and 7s. 6d. each; 42s. per dozen.
TRICHOPILIA COCCINEA ATRO-RUBENS.—The entire lip of a deep blood-red colour, very fine variety, 7s. 6d. and 10s. 6d. each.
TRICHOPILIA TURIALBE, Rehb. f.—Very rare and most distinct species, with citron-yellow flowers; only one single plant found by Collector, 25s.
TRICHOCENTRUM PFAU, Rehb. f.—A pretty winter flowerer; flowers of long duration. Small established plants, 7s. 6d. each.
The stock being very limited, early orders respectfully solicited.

Orders will be executed in strict rotation, and forwarded Post and package free to any part of Great Britain or Continent. Terms, payment within 30 days after receipt of plants, either by Post-office Order or crossed Cheque, made payable to EDWARD ORTIGUES, Inspector of Botanic Gardens, Zurich, Switzerland.

- " TRIANTE, Popayan varieties, 5s. each; fine, strong, 10s. 6d. each.
- ODONTOGLOSSUM CRISPUM LEHMANNI, 3s. 6d. and 5s. each.
- " EDWARDI, most distinct and beautiful species, very slow and difficult to establish. Small, but perfectly established plants, 10s. 6d. each.
- " HALLI LEUCOGLOSSUM, fine plants, 15s. and 21s. each.
- " XANTHOGLOSSUM, fine plants, 10s. 6d. and 15s. each.
- ONCIDIUM KRAMERI, quite distinct and superior to O. Papilio, several plants on each block, 5s. and 7s. 6d. per block.
- " PYRAMIDALE, rare and very pretty, with dense upright panicles of golden-yellow flowers, with conspicuous clear-white centre, 7s. 6d. and 10s. 6d. each.
- " UNDIATUM, most beautiful species, belonging to the Macranthum section, 15s. and 21s. each.
- PESCATOREI DAYANA, very rare and beautiful, figured in Bot. Mag., t. 6211. Recently-imported plants, showing new growth, 7s. 6d. and 10s. each, 60s. per doz.
- TRICHOPILOIA FRAGRANS ALBA (PILUMNA NOBILIS?), all segments clear white, with orange-yellow eye; very sweet scented. 3s. 6d., 5s., and 7s. 6d. each.

Orders will be executed in strict rotation, and forwarded, Post and Package free, to any part of Great Britain or Continent. The Stock, being very limited, early Orders respectfully solicited. Terms, payment within thirty days after receipt of Plants, either by Post Office Order or Crossed Cheque, made payable to—

EDWARD ORTIGIES, Inspector of Botanic Gardens, Zurich, Switzerland.

TWO GRAND NOVELTIES.

A PURE WHITE BEDDING CLEMATIS, and the FERN which has lately received so many of the highest awards and proofs of admiration.

CLEMATIS, SMITH'S SNOW-WHITE JACKMANII.

The flowers are paper-white, about the same size as those of the old purple Jackmanii, but produced in even greater profusion. It is unrivalled for beds, and also for climbing. Ready in August. 7s. 6d. each.

PTERIS TREMULA SMITHIANA.

This is a very valuable and distinct Fern. No Collection should be without it. Illustration and description free. 5s. to 10s. 6d. each.

We now have a very fine lot of the best varieties of CLEMATIS ready for planting out, also BEDDING PLANTS, and shall be pleased to send particulars.

RICHARD SMITH & Co., Nurserymen and Seed Merchants, WORCESTER.

ORCHIDS,

Clean, healthy Plants, at Low Prices. Thousands in stock. Please write for LIST.

FERNS A SPECIALITY.

The finest, most varied, choice and interesting collection in the Trade. 1400 species and varieties of stove, greenhouse, and hardy Ferns. Partially Descriptive Catalogue, including comprehensive List of useful Gardening Books, free on application.
ILLUSTRATED CATALOGUE (No. 21), containing 120 Illustrations and much valuable information on the cultivation of Ferns, ONE SHILLING and SIXPENCE, post-free.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

STANDEN'S
Established 30 Years. MANURE.

Exceeds all others in general fertilising properties and staying powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry Powder, with very little smell.

It is consequently particularly adaptable for Ladies interested in Plant Culture.

The highly fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

Sold in Tins, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each.

And in Kegs (free), at Reduced Prices:—
28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

LETHORION (VAPOUR CONE),
(PATENT).

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure.

PRICES—For Frames, &c., of 50 cubic feet, 6d.; 100 feet, 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each.

Owing to the enormous demand, intending users should give their Seedsmen Early Orders to secure a supply.

By permission of the Hon. Board of Customs
DUTY FREE.

TOBACCO PREPARATIONS
FOR
HORTICULTURAL USE.

THE "LONDON" TOBACCO JUICE.
(FREE OF DUTY.)

Manufactured from strong American Leaf Tobacco, and highly concentrated. Sold in bottles:—Pints, 1s.; quarts, 1s. 9d.; half gall., 2s. 6d.; gall., 4s. Or, in casks of 10 gallons, and upwards, at 2s. 6d. per gallon.

EXTRA STRONG TOBACCO JUICE.

Specially manufactured for Evaporating in Greenhouses. Pints, 1s. 6d.; quarts, 2s. 9d.; half-gall., 6s.; gall., 11s. And in kegs of 5 gallons, 10s. 6d. per gall.; 10 gallons, 10s. per gallon.

THE "LONDON" TOBACCO POWDER.

This preparation consists of best Virginian Tobacco, finely ground and mixed with other ingredients of an essential character. Price, in tins, 1s., 2s. 6d., and 4s. Or, in bulk, £3 per cwt.

NICOTINE SOAP.

An effectual and speedy Eradicator of Scale, Thrip, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting plants, without injury to foliage. In jars, 1s. 6d. and 3s. each, and in tins, 5s. 6d., 15s. 6d., and 25s. each.

The above articles are manufactured only at our Bonded Stores, SHAD THAMES, S.E., and are the only reliable Horticultural Tobacco Preparations produced. We caution the public against spurious articles offered by several firms.

SATURDAY, JULY 18, 1891.

DULWICH PARK.

THIS acquisition, opened by Lord Rosebery a year ago, has rapidly become attractive and popular. It will be remembered that the 72 acres which formed the site of the Park were the property of the Governors of Dulwich College, and were handed over by them to the Metropolitan Board of Works, and that it was laid out and is kept up at the expense of the successors of that body, the London County Council. An advantage of the site was, that it lay in meadows well planted with great Oaks, which seem indigenous to the stiff strong soil, and which now impart to this new site a noble aspect, such as only old parks, as a rule, can boast of. Another feature is, that the loafing population which lolls upon the grass in St. James's Park, thick as windfalls in an orchard, is here conspicuous by its absence. Dulwich Park, though open to all, is specially frequented by a superior class of visitors from the immediate neighbourhood, and their conduct, it is said, has always been, in the words of my informant, "first-rate."

In shape and outline, this new park bears some resemblance to the old one I have just mentioned, and it shares with it the ornament of water which sparkles in the bosom of some well-devised shrubberies, with winding walks, seats, and a bridge amongst them. The area of the lakelet would hardly admit of boating for a pastime, but it quite suffices for the dignity of several swans which ride proudly upon its surface, and during last winter hundreds of skaters found room for daily amusement on the ice for weeks together. Summer has come, and the lake is still the centre of attraction to hundreds who sit, or saunter, on its margin in the soft hours of evening. Most persons will allow, whether they have seen Niagara, or not, that there is something exceedingly attractive in a waterfall, and I must not omit to mention that the water quits this lake, as the St. Lawrence does Lake Erie, by a fall, below which the little stream winds through a well-kept lawn to its exit from the Park. The margins of the lake and stream are neatly set with large flints, and they will presently be made even more ornamental than they are already, by the planting, close to the water, of appropriate subjects such as Bamboos, Arundo Donax, Pampas grass, Acorus calamus, and perhaps, if it be not too big, that noble plant, denizen of Dove-side and many a mountain stream, the great Water Dock, Rumex hydrolapathum.

To give the exact position of the Park, it fills the shallow valley which stretches from Dulwich village towards Lordship Lane station. In shape the grounds are four times longer than their breadth, a fortunate disposition of the surface which adds considerably to its picturesque appearance. Standing by the handsome gateway

and the ornamental house of the superintendent, which forms a lodge at the entrance, hard by the old church in the village street, and near the picture gallery, the graceful spire of Lordship Lane church is seen as a pleasing boundary mark, a little distance beyond the long stretch of park. The Crystal Palace is within sight, a mile distant; Dulwich College is nearer at hand, and great houses, occupied by successful magnates in every branch of industry, are plentiful in the neighbourhood; and all around are handsome streets and "roads," innocent of shops, with hundreds, nay, thousands of big houses standing in their own well-kept grounds. Of all the suburbs of London this seems to me by far the pleasantest, by virtue of its position on the southern side of the Metropolis, its uneven contour, so superior to a dead level, its meadows well planted with timber, and its beautiful gardens and shrubberies, where song birds are allowed to build their nests, and never cease to show their gratitude by making delightful music. There is hardly a day in the year when the thrush does not sing, either from some sheltered nook near the door of the friend who feeds him in hard weather, or from the tree tops. To resume my special theme, the finishing touch was given to this pleasing spot by the Park, which provided for the public exactly what was wanted—wide lawns, old Oaks, cricket grounds, ample spaces for lawn tennis and football, a delightful smooth road for cyclists, and a lounge with seats for young couples who have negotiations to carry on.

I must now endeavour to describe the excellent gardening, for which this new park enjoys a fast-growing fame. As to the landscape gardening, not even St. James's Park was more skilfully laid out by J. C. Loudon than was this one under the supervision of Mr. Sexby. Flower borders, shrubberies and grass, water, and winding walks are all nicely intermixed, so as to secure the utmost variety that the space can afford, and by-and-by, when the freshly-planted clumps of shrubs and trees are further advanced in growth, the concealment of boundaries and the other arts of landscape gardening will greatly add to the apparent size of the enclosure. Rhododendrons were largely planted here last February, and although dreadful weather followed, some gorgeous masses of blossom were displayed even in the first season. A second brilliant display has been secured by a great variety of Poppies sown among the shrubs, and by masses of flowers, including many of those herbaceous plants which all who attended the Rose show at the Crystal Palace on July 4 must have very much admired—Pinks, Pyrethrums, especially *P. roseum*, a flower which has been wonderfully transformed by florists within the last few years; Gaillardias, and other perennials now very much in fashion. I should like to mention *Eryngium giganteum*, one of the Sea Hollies, growing here 6 feet and 8 feet high, and rejoicing in the deep strong soil; it is an emperor among plants, elegant in spite of its rigid aspect, and too noble to be passed without exciting admiration. Among other notable specimens in their season are the Peacock Anemone, *A. stellata fulgens*, with dazzling flowers; *Acanthus candelabrum* (?), with pink flowers, one of a stately group remarkable for beautiful foliage and numerous spikes of flowers; and many kinds of Campanula, including *C. latifolia macrantha*, a pyramidal bush 4 feet high, bearing large blue flowers, and well suited to back places in herbaceous borders. Mr. Melville is the presiding genius here, and he is backed by a good staff of intelligent men, who all share the general regret that the excellent superintendent is about to leave, having been promoted to the management of

Finsbury Park. Mr. Melville, a born gardener, as was his father before him, has enjoyed a wide experience in gardening. I found him, however, a most unassuming man, possessed of the characteristic modesty which belongs to merit. He is fond of assembling together several species of some of the more striking groups of plants, so that their contrasts and character may be displayed side by side.

There are several examples of rockwork, planted with alpinists in the Park, but the most extensive gardening of this kind is on either side by the carriage-road after passing through the Snakes' Lane entrance. The arrangement here was well conceived. The broad strip on each side of the road was laid out in the semi-wild style of gardening. In the background, under the fences on either side, might have been seen, two years ago, a bare rootery—if such a word may be used—consisting of snags and scraggs of roots, butts of trees, and many a contorted piece of timber, with rockwork in front. All these uneven surfaces are now covered with Ivies and other creepers such as gardeners employ to render ruins and rockwork ornamental—Honeysuckles, Clematis, climbing Roses, which delight in the soil, and blossom profusely; Virginia Creepers, Hops, Brambles, of the new and handsome species; and several other plants. Here and there, among the rocks, are Laburnums, Acacias, Pyruses, and Maples, trees or bushes, which are also sprinkled over the whole park in great variety, from the common and corky British Maple with small leaves, to some of the large-leaved foreign sorts. The home of the alpinists here is of course among the rocks. The Saxifrages are largely represented, and the common London Pride, which was at first freely used to cover an extensive space with economy, is now giving way to more valuable varieties. The alpinists are a ceaseless source of interest, and I therefore noted down a few names, familiar enough, no doubt, but still pleasing to the lovers of these plants, as are the names of friends whose virtues we like to hear of. *Saxifraga pyramidalis*, one of the most remarkable of the flowering type, has rosettes of leaves 6 inches in diameter, and from these spring pyramidal plumes of white flowers to a height of 18 inches to 24 inches, forming a beautiful object not to be forgotten. *S. Wallacei* is a fine large-flowered variety. *S. longifolia* is another tall one, having long silvery leaves; and contrasting with these are *S. cœsia* and *S. squarrosa*, which form lichen-like tufts, scarcely rising above the soil. I must not omit that gem of the alpine world, *S. oppositifolia*, producing sheets of showy rose-coloured flowers in spring; nor that fine, good, old-fashioned sort, *S. cordifolia*. There are others of the several sections, kidney-leaved or mossy, the latter covering their border, or rock, with wide cushions of lovely green, summer and winter. There are Sedums, Stonecrops, to which are allotted the driest and sunniest places, and *Sempervivum*, House-leeks, in several forms. A little like *Sempervivum arachnoideum*, Cobweb House-leek, is *Androsace sarmentosa*, from the Himalayas, which prefers that its downy foliage should be kept dry by resting on stones. Its larger, bright rose flowers, with white centre, are produced in umbels. It is propagated by runners, like the Strawberry, and Mr. Melville, like other growers, has found it liable to damp-off in winter, as described in a recent correspondence in the *Gardeners' Chronicle*. It does best here in the recesses and crevices of the rockwork, where it receives partial protection from the weather. *Epimedium* (Barren Wort) is a beautiful genus of dwarf-growing plants, well described

in Mr. Ware's excellent catalogue of hardy perennials, grown by him at Tottenham, as "forming neat clumps about a foot high, of long-stalked leathery leaves, and graceful panicles of lovely flowers—white, yellow, lilac, crimson, purple, and lavender." The foliage is tender and delicate in appearance, though tough; the leaves are heart-shaped, and green in colour, tinged with coppery-bronze. I must be content with merely naming such lovely but well-known things as Thrift, Heaths, *Iberis corifolia*, an evergreen Candytuft, Thymes, such as *T. coccinea* and *T. montana*; *Erodium*, several species; and scarlet, pink, white and yellow *Cistus*—true alpinists, much at home here in the rockery. *Geum montanum* is another capital rock or border perennial, with compact tufts of foliage, and showy golden-yellow flowers on stems a foot high or less. The *Drabas*, little spring flowering plants, with compact cushions of foliage covered with white and yellow flowers, are much admired here. So, of course, are the *Hepaticas*, common as air and water, but not the less excellent and ornamental on that account. Among the *Aubrietias*, which are usually blue or purple, the only pink one, *A. Leichtlinii*, attracts great attention here. The gardening world owes it, I believe, to the art which has conferred upon us so many novelties, the raiser having selected and perpetuated plants bearing flowers nearest to pink in their hue, till he succeeded in producing a pure pink strain. *A. Campbelli* is another improvement, famous for a vigorous constitution, and for large flowers of deep violet-blue colour. There are some fine varieties of *Funkias* putting up their broad Palm-like leaves, of sub-tropical aspect—though they are as hardy as common Plantains. *Stachys lanata* is here, that common white-leaved plant; and the *Mimulus*, another good old sort not yet surpassed for beauty, seems to revel in the damp soil. *Gaultheria procumbens*, with white flowers and red berries, is a cheerful little thing, easily detected in the crevices of the rocks.

The strips of border in the foreground of the rockeries, right and left of the entrance in Snakes' Lane, was bright with Daisies, the *Polyanthus*, *Crocus* and *Snowdrop* in spring, and are now fitted with the plants that follow in succession, such as Pansies, *Phlox Drummondii*, *Dianthus chinensis*, and the beautiful Spanish Iris, with specimens of a narcotic "weed" much cultivated in America, and known by the name of *Nicotiana tabacum*, a plant with fragrant flowers, and, as most people seem to think, with still more fragrant leaves. Last among the plants that must be named are the Campanulas, which are here in great force, in numerous varieties, from *C. macrantha*, one of the largest, to the small Hairbells growing in crevices like *C. pumila alba*, or *C. nitida alba*, a pure white Hairbell, about 13 inches high. The rest must be omitted. They were in great perfection at the Crystal Palace Rose show, as were *Delphiniums*, also well represented in Dulwich Park. I may add that the Pyrethrums, so much admired this summer, were all seedlings sown at the end of March last year. It should be mentioned, too, that houses for propagating and for wintering bedding plants, have just been erected. *H. E.*

NEW OR NOTEWORTHY PLANTS.

LILIUM LONGIFLORUM VAR. *CHLORASTER*,
Baker.

THE *Lilium longiflorum*, of which bulbs were brought by Dr. Henry along with *Lilium Henryi* from Western China, has now flowered at Kew for

the first time, and proves to be a well-marked variety. The stem is about 3 feet long, and very glaucous. The leaves are bright green, lanceolate, usually three-nerved, rarely five-nerved. The connivent funnel of the perianth is more open than in typical longiflorum, resembling that of *L. Brownii*, measuring about 4 inches in length by 2 inches in diameter at the throat before the segments begin to reflex, and down the back of each segment there runs a distinct green keel. The anthers are shorter than in typical longiflorum, linear-oblong, not more than a third to half an inch long, and the pollen (here again as in *Brownii*) is red-brown. *J. G. Baker, Herbarium, Kew.*

KNIPHOFIA NORTHLE, *Baker.*

This has just been flowered for the first time in this country, so far as I am aware, by Mr. W. E. Gumbleton, at his seat in county Cork, where he finds it to be perfectly hardy. It is nearly allied to *K. caulescens*, and was first introduced into notice by the late Miss North, from whose painting in the Cape ante-room in her gallery at Kew it has become well known, and who brought home a living plant and presented it to the Kew collection. I am informed by Mr. Tidmarsh, of the Botanic Garden at Grahamstown, that it was originally discovered in a wild state in that part of the colony by Mr. W. Dugmore. We, however, knew nothing about it in Europe till Miss North painted it, and introduced it. The following description is made mainly from the living plant, which Mr. Gumbleton has just kindly forwarded. It was originally named and described in Britten's *Journal of Botany*, 1889, p. 43.

Stem shortly produced, 2 to 3 inches in diameter. Leaves thirty to forty, in a dense rosette, lanceolate acuminate, glaucous, broadly channelled down the face, not acutely keeled on the back, 4 to 5 feet long, 5 to 6 inches broad low down, tapering gradually to a long point, the margin distinctly serrulate, the inner leaves of the rosette growing gradually narrower and shorter. Peduncle shorter than the leaves, an inch in diameter at the base. Raceme very dense, $\frac{1}{2}$ to 1 foot long, 3 inches in diameter; pedicels very short; bracts ovate, brown, membranous, $\frac{1}{4}$ inch long; upper flowers tinged with bright red; lower entirely yellow. Perianth cylindrical, an inch long; lobes small, ovate. Stamens and style finally half as long again as the perianth. *J. G. Baker, Herbarium, Kew.*

WADDON HOUSE, CROYDON.

PHILIP CROWLEY, Esq., the Treasurer of the Royal Horticultural Society, is well known to most plant lovers, and his priceless collection of butterflies and bird's eggs renders him equally well-known to entomologists and ornithologists. His pretty residence has on the one side, gardens, of which the main feature is an immense bed of subtropical plants, and on the other side, the house is furnished with a verandah and pillars, over which the summer climbers twine. Facing this side of the mansion is a pretty lawn-tennis ground, the corners brightened with Pelargoniums and the flower beds, and enclosed with a broad bank of herbaceous perennials in which Lilies, Campanulas, &c., make a fine show, and in which an occasional plant of the Edelweiss proves the situation not too warm or dry. Continuing the walk from the flower gardens, some rockeries planted with hardy Ferns are reached, in which, despite the rigours of the past winter, the plants are in fine health. Here, the many forms of *Lastrea*, *Polystichum* and *Athyrium* exhibit much beauty, and the large patches of *Onoclea sensibilis*, *Adiantum pedatum*, *Polypodium Dryopteris*, and *P. Phegopteris* bespeak great age. Here, too, were noted several specimens which may be deemed of more than average—indeed, of historical—interest; the one is a large tuft of *Cystopteris montana*, which was brought from southern Europe by Mrs. Crowley's father some forty-five years ago, and which has increased in bulk despite the many offsets which it has furnished from time to time. In these rockeries the

Adder's Tongue Fern and other reputedly difficult species luxuriate, and among them the tall sprays of *Campanula persicifolia alba* make a pleasing effect, and so also the graceful Foxgloves.

From the Fern Dell a noble walk runs beneath lofty Beeches, and in a sheltered angle the kitchen garden is placed, well cropped and tended by Mr. W. King. In the kitchen gardens, and in the newly-extended fruit gardens, there was a more than average crop of fruit. About 350 trees have been planted in recent years, and with very satisfactory results. The fashion of planting many sorts, fallen into by many persons, was avoided here, and judging by present appearances, Mr. Crowley would be entitled to give valuable advice to intending planters.

Everywhere in the Waddon gardens advantage is taken of sheltering corners, kitchen garden walks, and nooks, to sow quantities of showy annuals.

THE PLANT-HOUSES.

Mr. Walter King, who has for many years been gardener at Waddon, has enhanced his reputation by the excellence of his plants, which are to be found at most of the important exhibitions. The secret of success may with perfect fairness be told, for it is an open one, viz., the knowledge of the exact time when the feeding a plant, be it a specimen *Allamanda*, *Bougainvillea*, a *Caladium*, or *Anthurium*, or a Cherry, Plum, or Peach, may be begun; and what is of equal importance, a keen perception of the proper time to discontinue the feeding, and arrange for the ripening of the wood. These may at a glance seem but simple matters, but in reality they are those on which success in plant or fruit culture depends.

Starting from the mansion, the conservatory is the first structure, with its fine but not too crowded furnishing of Palms, Ferns, and flowering plants. Among these the many examples of *Spiraea palmata alba* were very effective, and the various species of *Gladiolus* showy. In the next house was an effective Fern rockery, with *Begonias* planted among the Maidenhair and other species of Ferns, and all looking very natural and very effective, in that the floor and the sides of the house consist of natural rock.

THE ORCHIDS.

These plants command fair attention, and many extraordinary specimens were observed, viz., a noble specimen of *Dendrobium moschatum*, which is trained over the roof of one of the houses, and which carried annually from eighty to a hundred spikes. The show house contained a brilliant display of *Cattleyas*, *Laelias*, *Odontoglossums*, two varieties of *Laelia purpurata*, one with pure white flower and violet lip, and the other with almost wholly crimson flowers being especially effective. Here, too, were *Odontoglossum citrosimum armeniacum*, a beautiful species with apricot-sepals and petals; also *O. c. album*, the pure white variety, and many of the ordinary form. *O. crispum* here is well represented by a score or so of plants of more than average merit, the *O. c. lilacinum* being very near to the *O. c. "Purple Emperor,"* of Burford Lodge. In this show-house were observed many very good plants of *Cattleya Mossie*, *C. Mendeli*, some grand *Miltonia vexillaria*, the noble old *Maxillaria tenuifolia*; a *Sophranitis grandiflora* which had borne over forty flowers; and some good masses of *Epidendrum vitellinum*, *Lycaste aromatica*, and showy *Masdevallias*.

In another house set apart for plants were noted grand specimen *Clerodendrons*, *Allamandas*, *Ixoras*, *Anthuriums*, *Alocasias*, and many others; the specimens of *Davallia fijiensis*, *D. f. plumosa*, *D. Moorei*, *D. hirta cristata*, Killarney Fern (*Trichomanes radicans*), and others, more than 5 feet across, were very fine. In some of the houses *Bougainvilleas*, *Stephanotis*, and the old but rare *Hoya imperialis*, were rich with bloom. In one house the roof was entirely covered with Citron, with a profusion of large fruits and flowers. In another, *Aristolochia elegans* had hundreds of flowers and flower buds, and the *Dieffenbachias*, *Crotons*, and *Dracenas* are of

marvellous size and colour. In the greenhouses were noble specimens of *Dracophyllum gracile*, *Azaleas*, *Boronias*, and the specimen of *Lomatia propinqua*, which recently produced their flowers, and caused thereby so much interest. The fruit-houses have fine crops of Grapes, Plums, Peaches, &c.

MANURES FOR THE GARDEN.

IN continuation of this subject, we may mention that it was stated by a Grape-grower, that he applied a heavy dressing of dried blood, or other animal manure, to some Isabella Grapes, and they grew as large as Black Hamburgs, but none of them ripened. The reason for this is obvious. The organic nitrogen of the manure was not converted into available plant-food till the soil was warm and the season advanced, and this conversion was continued all through the summer and autumn. It was precisely as though nitrate of soda had been sown every day on the vineyard, and thus kept the Vines growing with excessive vigour without any chance to mature either the wood or the fruit.

What Vines want is a dressing of superphosphate or bone-meal in the autumn or early spring, dug or cultivated into the soil, so as to get the manure down to the roots, and then as early in the spring as the soil will admit, a dressing of from 200 to 300 lb. of nitrate of soda to each acre of ground, or we believe that Wood & Sons' *Le Fruitier*, applied at the rate of 1 ounce to each square yard of ground, would be equally efficacious.

In the form of these concentrated manures, nitrogen is immediately available, and will be promptly taken up by the roots, and furnish a sap rich in nitrogenous matters and phosphoric acid, and thus force a healthy, vigorous growth early in the season; and, in a few weeks, there will be no nitrate left in the soil to produce an excessive growth of wood, or to retard the ripening of the Grapes.

Nurserymen, as a rule, do not believe in commercial fertilisers, but they have great faith in stable-manure. This is not surprising. Ordinary fertilisers are often disappointing, and not what they want. They do not contain enough nitrogen. Professor Snyder, of Cornell University, has analysed a two-year-old Apple tree. Assuming that a block of Apple trees in the nursery would produce a growth each year of five tons of dry wood and leaves, they remove from the soil, according to the investigations of Professor Snyder, 12 lb. of phosphoric acid, 44 lb. of potash, and 89 lb. of nitrogen. The trees are thus shown to contain over seven times as much nitrogen as they do of phosphoric acid.

There is an old saying, "Letting land lie in grass impoverishes the father but enriches the son." When an old meadow or pasture is broken up, the old grass, roots and sod all decompose, and furnish a considerable quantity of nitrates and other plant food, and double or treble the amount of produce from succeeding crops is obtained than if it had remained in grass; but, of course, this is obtained at the expense of previous accumulations of organic matter in the sod and soil. The son thus gets the benefit of his father's saving.

Nurserymen generally understand this matter, and when they rent land they prefer that which has been in grass for some years. Nurserymen cultivate their land very thoroughly between rows, and this constant stirring of the soil facilitates the decomposition of the sod and other nitrogenous organic matter. But after it has been cultivated for some years the accumulated fertility is gone, and recourse must be had to manure from external sources.

Mr. Harris does not say that a nurseryman, after he has grown a crop of Apple trees on pasture-land for four or five years can, by the use of plenty of nitrates and other plant food, continue to grow luxuriant blocks of nursery trees, but he does not see why it should not be done. All the indications warrant us in assuming that the mineral elements of plant food, such as phosphoric acid and potash,

accumulate in the soil while it is occupied by nursery trees, but there is unquestionably a considerable loss of nitrogen. Messrs. Lawes & Gilbert's summer fallow experiments at Rothamsted clearly show this to be the case. The loss has been so great that it can be detected by analysis as well as by the decreasing crops.

Improved horticulture will not enable nurserymen to grow cheaper products—but better. The judicious use of fertilisers will not enable growers to sell Apples at one shilling a bushel, but they will, combined with careful selection of varieties and good management, enable them to raise Apples better worth four shillings per bushel, than the fruit from a starved and neglected orchard is worth one shilling.

Great advances have been made in the introduction of improved varieties of fruits and vegetables, and this necessitates cleaner and richer land. Thirty or forty years ago, it was thought that Tomatos must have poor soil or they would run all to bines. Now our improved varieties will stand a liberal dressing of superphosphate and nitrate of soda, and it is not easy to determine who exhibits the greatest folly, the man who fertilises his land and then plants poor varieties, or the man who plants the best and most improved sorts and then neglects to furnish them with a liberal supply of appropriate and available plant food.

Professor Bailey of Cornell University, has shown, not only that an improved variety of Tomato will stand heavy manuring, but that it doubled the crop of fruit, and gave Tomatos that were smoother. He put 6½ tons of good stable manure per acre, containing probably not less than 600 lb. of nitrogen. On an adjoining plot, on poorer land, he applied 200 lb. of nitrate of soda alone per acre, containing 32 lb. of nitrogen, and it increased the crop of fruit from 6½ lb. per Vine on the unmanured plot to over 9 lb. per Vine. On the plot receiving this small dressing of nitrogen, the Vines had very dark foliage, which shows that they would have been all the better for a dressing of superphosphate with the nitrate of soda.

Soils vary in respect to the plant-food they supply in available forms. Phosphoric acid and nitrogen are most often deficient; next comes potash; then lime and sulphuric acid, and rarely magnesia.

But the infertility of soils is due to other causes, perhaps nearly as often as to the lack of plant-food. Soils often do not possess the proper texture—they are too compact, or too loose; or they are too shallow; or they lack absorptive powers—they cannot retain the plant-food until plants use it, but suffer it to be washed away by drainage-water; or the moisture supply is bad—they are too wet or too dry. These defects are as fatal as lack of plant-food. Many soils need amendments first and then manure. *J. J. Willis, Harpenden.*

TREES AND SHRUBS.

DIMENSIONS OF CONIFERS, &c, AT HATTON PARK.

This was a famous house at Feltham, Middlesex, in days gone by, when it was the residence of the late Chief Baron Pollock, a great lover of trees. It has numerous fine Conifers dotted about its grounds. The estate is still in the possession of the family. The genera *Abies* and *Picea* are well represented; an example of *A. grandis* has attained a height of 52 feet, with a circumference of bole of 5½ feet at a height of 2 feet from the ground; *A. Pinsapo* and *A. nobilis* each 58 feet, and a circumference of 5 feet. There are two fine specimens of Cedar of Lebanon on the south-east side of the mansion, each measuring 48 feet in height; one with a girth of 10 feet 2 inches, and the other 9½ feet at 2 feet from the ground.

Araucaria imbricata, of very symmetrical growth and in fine health, measures 38 feet in height and 4½ feet in girth of stem. *Cupressus Lawsoniana*, a really grand example, is 29 feet high; and *Cryptomeria japonica*, 45 feet. *Taxus adpressa* has a

spread of branches of 28 feet, and a height of 4 feet; *T. a. aurea*, spread of branches, 36 feet; height, 8 feet. *Thuia gigantea* is 30 feet high, a noble well-shaped tree; *Thuopsis dolabrata variegata*, 10 feet; *Juniperus virginiana*, 16 feet; and *Pinus maritima*, 45 feet high. *Biota aurea*, 18 feet in circumference of the branches.

The place does not lay claim to attractions under glass, but the well-kept old-fashioned conservatory contained a wonderfully well-bloomed plant of *Rhododendron Countess of Iladdington*; a fine and vigorous example of *Cereus* sp. covers one of the greenhouse walls; this must be an object of great beauty when in bloom. Black Hamburg Grape vines are healthy and vigorous, and they will, doubtless, give a good account of themselves in the fruiting season. Mr. W. Brittain is the gardener in charge. *B.*

CYTISUS SCOPARIUS ANDREANUS.

This seedling from the common yellow Broom, is likely to prove useful as a forced plant—that is, if it be afforded greenhouse treatment during the winter, flowering from March onwards. It is, moreover, a pretty border or shrubby plant. It is propagated with great ease by grafting on stocks of the common Broom, and the best method to adopt is wedge-grafting, the union obtained being more satisfactory than side-grafting affords, and which is best when performed in the spring, the grafted plants being plunged in cocoa-nut fibre or tan, in cases where the temperature ranges from 50° to 60°, and in three weeks' or a month's time they can be taken out of the cases and stood on the side stages of the house, and in a few weeks time they will be fit for planting in the open air.

Plants that were treated as described above (with the exception of not being planted out) were kept growing in pots all last summer fully exposed to the sun, liberally supplied with water, and placed in cold frames in the autumn, and about Christmas time were put in an ordinary greenhouse, and on March 2 they commenced to open their flowers. It will be very interesting to know whether it will reproduce itself from seeds, or run back to the original form. Last year it produced seeds very freely, which were sown in light sandy soil, and the pots placed in a temperature of 55°; some germinated in three weeks' time, while others took three months to come up. These are now being grown on for the purpose of proving whether they will come true or not, but I am inclined to think that this mode of propagation will not be a success. *H.*

THE IRISH YEW.

The original Irish Yew, which was first discovered a century or so ago at Florence Court, near Fermagh, was a female plant. Its history is given in the *Gardeners' Chronicle* for 1873, p. 1336. Being propagated mostly by cuttings, it has preserved its character, though Messrs. Veitch say that seedlings from it nearly always revert to the common type, which may be the result of its flowers being fertilised by the pollen of the common Yew.

To Mr. Tillet, of Spowston, near Norwich, we were lately indebted for the receipt of sprays of the Irish Yew, bearing unequivocal male flowers. We trust Mr. Tillet may succeed in fertilising the berry-bearing plants of the Irish Yew with the pollen. It is very possible that under such circumstances the seedlings would "come true." It must be borne in mind that it is a frequent occurrence for dioecious trees to become monoecious. The Yew occasionally does so. We would also point out that the upright form and the arrangement of the leaves on all sides of the branches—peculiarities which characterise the "fastigate" form—are really the juvenile characters, which, contrary to custom, have become persistent. The adult arrangement, from some cause or another not known, has not been assumed, so that the plant is, so to speak, an overgrown baby. Examination of seedling plants, and of strong-growing leading shoots, will illustrate the truth of these statements. A dwarf form, known as *Taxus sempiterniformis*, has its leaves similarly arranged. *M. T. M.*

COLONIAL NOTES.

"PREUM-BESJES."

(See *Gardeners' Chronicle*, p. 408, vol. ix.)

Owing to the Cape Colony being a biggish place, with very varied and very localised vegetative forms, one name does duty for several different trees, shrubs, or berries, that have some sort of rough resemblance, but grow in far distant divisions; so that it is not always easy to give an accurate name for a vernacular one. But since Mrs. Church, in her chronicles of an ostrich farm, is describing a very well-known Karoo property, one can get at the solution of your correspondent's difficulty pretty certainly. "Preum-besjes," as the word ought to be written, *i.e.*, Plum-berries, are the fruit of *Pappea capensis*, E. & Z. (*Sapindus Pappea*, *Lond. in Fl. Cap. i.*, 24.) They are about the size of the top of one's little finger, at first capsular, the thin papery shell cracking evenly, and exposing the little cherry-red fruit, which is not very much unlike a red Currant in flavour. The tree is never large, seldom reaching 20 feet, and grows mostly on the rands or ridges of low trap hills that intersect the Karoo. The seed is brown, smooth, and very oily. The Boers, who have a medicine of their own when the huisapothek, or drug-box fails, boil the crushed seeds, and collect the oil that rises to the surface of the water as a substitute for castor-oil, if little Coos, or Saonie, has eaten too many green mealies, and begins to complain. It is mildly effective, and from this use the seeds get the name of "Olie-pitten." Elsewhere the children call the fruit of *Colpoon compressum*, Brg., preum-besjes. This low bush, the *Osyris compressa*, DC., bears a pyriform red drupe, ultimately becoming deep purple. It is just eatable, a sort of African Unedo—at least, I never eat two at a time. The whole shrub, stems, twigs, and leaves, is cut up or pulled up in large quantities for the use of the tanners, who value it greatly as a substitute for Sumach. I suppose they would use the bark only, were the stems large enough for that process, and this they signify by calling the plant by a vagary of naming, "Pruim-bast, *i.e.*, Plum-bark. Then there is "Kafir-Preume," the red acid Plum of *Harphephyllum caffrum*, a most beautiful forest tree of the eastern districts. None but school boys, whose *dura ilia* can stand anything that bears the name of fruit, could eat it. The skin is tough, the pulp scanty, and the stone disproportionately large. But your correspondent must not hope to naturalise the *Pappea*. It would take a weary long while to grow to bearing age, and a pint of Red Currants would be worth the whole crop of a tree 10 feet high. *P. MacOwan.*

SINGAPORE.

Coffee Leaf Fungus.—The *Agricultural Bulletin of the Malay Peninsula*, the first number of which is before us, contains a condensed abstract of Dr. Burck's articles on the treatment of the Coffee leaf disease (*Hemileia*) in Java. Dr. Burck finds that the spores germinate in darkness only, full light being very prejudicial to them. Water and air, and more or less complete darkness, are the requisites for germination [facts which suggest the possible use of the electric light in the future. *En.*]. For the cure of the disease, Dr. Burck employs sulphuric acid (vitriol). A drop of this caustic fluid is placed on the diseased spots on the leaf by means of a bamboo needle, and causes the destruction of the fungus. Another plan is to cut out with scissors the diseased patches, which are then destroyed. It would seem that neither of these practises, however good in theory, could possibly be adopted on a large scale, but we are told of two planters who have tried them on 220,000 and on 170,000 trees respectively, and who were well pleased with the results. Various preventive remedies were also tried, but tobacco water, used in the form of spray to the under-surface of the leaves, is most efficacious, killing the fungus without injuring the Coffee leaf. Hedges are recommended to break up the plantations, and check the progress of the spores.

ABURI, GOLD COAST.

At the botanical station here, preparation for the culture of Liberian Coffee, Cacao, Egyptian Cotton, and other economic products have made satisfactory progress under the direction of Mr. Crowther. Excessive heat with little range and a saturated atmosphere for a large part of the year, are not very wholesome conditions for Europeans, though many plants thrive under such circumstances. Dr. Easton contributes to the Report before us an interesting note on the use of *Newbouldia laevis*, a Bignoniaceous plant, in the treatment of dysentery.

"THE AGRICULTURAL GAZETTE OF NEW SOUTH WALES."

This is a Government publication, issued for the purpose of disseminating cultural information to farmers and fruit growers. Thus, in the number before us, we find notes on various economic plants, illustrated articles on the grasses of New South Wales, by Mr. Turner; notes on the diseases of plants and their treatment, and so large a number of useful hints that one envies the colonial farmers.

VEGETABLES.

At Glenhurst, Esher, the gardens of which are under Mr. C. J. Waite's charge, many of the best varieties of vegetables are grown as well as anywhere in the country.

FIG. 10.—MALFORMED FLOWER OF DIGITALIS.

The gardener is a successful exhibitor at metropolitan and other shows, but he does not grow anything especially for exhibition, all being treated alike. We may say that he is a firm believer in deep cultivation of the land, perfect cleanliness amongst his crops, and in the abundant use of liquid manure, of which he never lets a drop run to waste.

It was interesting to note the earliness of the Cauliflowers sown on January 27, and planted out March 22, in an open spot away from all protection. These were almost cleared off, whilst the autumn-sown ones were still being cut, and not very good either, the winter having punished them to a certain extent, and the heads were small. The first head from the winter-sown lot was cut on June 1. Another Cauliflower of considerable earliness is Sutton's First Crop, a variety with no visible stem, few leaves, and broad flattish head. Owing to want of leaves to shelter the latter from the sun, it is not good in colour, but the variety is a decided acquisition. It should be sown in January for early cutting.

Finer Lettuces could be found nowhere than here. The varieties principally grown are Webb's Monstrous White Cos, and Sutton's All Heart. These Lettuces had been planted at 1 foot apart in the lines, which stood in the wide spaces between rows of Peas and Runner Beans; and, when large enough for use, each alternate plant was cut, and the remainder left to grow to a very large size, which of

course they did, assisted by manurial aids of one kind and another.

The transplanting of Onions has, here, the preference over sowing in the open, and very fine they were, standing at about 10 inches apart, in long lines. For early fruiting, Glenhurst Favourite Tomato is grown, and a very fine lot of plants were found in fruit in a span-house. It is a variety that sets its blossoms in the bad weather better than others, and is not injured in the least if it stand under partial shade. The red-coloured fruit is globular, and not ribbed, and has been grown up to 18 oz. in weight. Mr. Waite fruits some of his Tomatos in boxes 15 inches by 7 inches by 24 inches, two or three plants in a box. These are stood out-of-doors all the summer after setting a crop of fruits, and may be taken to any dry warm glass-houses in September, if the weather be then not favourable to growth. Peaches, Nectarines, Vines, &c., are also well-grown and fruited.

CAMPANULATE FOXGLOVES.

EVERY season we receive numerous specimens similar to that illustrated at fig. 10, and this year the examples sent to us have been more numerous than ever, whence we infer that the condition is specially frequent. The explanation is, that several flowers have, as it were, run into one, producing an erect, apparently simple but really composite, bloom at the top of the stem. In the

and Mr. Cuming has lately sent it from Manilla to Messrs. Loddiges, with whom it flowered last July" (*Bot. Reg.*, 1838, t. 11). The Philippine plant thus introduced to cultivation was afterwards figured in the *Botanical Magazine*, t. 4237, and is still cultivated under this name. It is a matter of great interest to know that after the lapse of nearly seventy years a genuine Mauritian specimen has been introduced, and is now flowering in the Orchid-house at Kew. It was sent by C. W. Bewsher, Esq., of the Oriental Bank, Mauritius, together with other native Orchids collected by him. I am inclined to think Lindley has confused two or three closely-allied species, for the one now flowering at Kew seems sufficiently distinct from that so long known in gardens under the name. Its flowers are light yellow, without spots. A second specimen from the same source is said to have red flowers. There are no dried specimens at Kew of the Mascarene plant; but the plant now flowering agrees well with the figure given by Thouars. Its appearance in cultivation is very interesting. *R. A. Rolfe.*

LYCASTE SKINNERI, PITT'S VARIETY.

This very curious Lycaste comes from Horace Pitt, Esq., of Stamford Hill, and by some persons it might be regarded as being a distinct species; its sepals are narrower and longer than those of the ordinary form, and of a peculiar greenish-white tint, merging into buff. The petals are also narrower, and not so closely folded over the column as in the type; they are white, tinged with rose at the base. The lip is also narrow, whitish with rose spots. It is a very peculiar and distinct form. *J. O'B.*

CYCNOCHES CHLOROCHILON, Klotzsch, ♂ AND ♀.

There are probably few orchidists to whom the quaint and fragrant flowers of *Cycnoches chlorochilon* are not familiar, as the species has been in cultivation for a long period, and is now pretty common. The appearance of the second sex, however, has either not hitherto been recorded, or I have failed to find it, and therefore I have great pleasure in calling attention to the following incident, which fills a blank in our knowledge of this singularly dimorphic genus. M. Houzeau de Lehaie, Member of the Chamber of Representatives, Hlyon, near Mons, Belgium, has sent to Kew a flower of each sex, which appeared in his collection on distinct plants, received from Caracas, the native home of this species. The male is the form so long known in gardens, with slender column and pollinia normally developed; while the female, which had been expanded for six weeks when forwarded, and still in good condition, presents the following characters:—The flower is distinctly larger and more fleshy than the male, and with broader sepals and petals; the lip a little larger, with broader much more obtuse crest; the ovary more than twice as thick, and more strongly grooved, and the column scarcely half as long, at least four times as thick; no pollinia, but a well-developed stigma, with a pair of large fleshy incurved wings on either side. The colour is identical in the two sexes. To those who are familiar with the great diversity between the sexes in *C. ventricosum* (♂ described as *C. Egertonianum*), *C. Warszewiczii*, *C. pentadactylon*, or *C. Rossianum*, the close resemblance in the species now under notice will appear very remarkable, if not inexplicable. To me it is specially interesting, because it clears up what I have long been unable to understand. *C. ventricosum* is well known to be the female sex of a species, but the *C. chlorochilon* so long known in gardens, and which bears so close a resemblance to it, had the pollen uloué perfect, and appeared to be a male. Had it appeared to be a female, one would have looked out for a male somewhat like *C. Egertonianum*, but not being so I was completely baffled. Could it be hermaphrodite? Well, I tried to fertilise it, taking the pollen from another flower, but all in vain. And yet all goes on calmly in Nature—and now we have the key of the situation in the present example. It is clear that we have in *Cycnoches* two very dis-

very young condition the little tubercles that are to form the flowers are close together. Some arrest of growth takes place, the flowers that should be separate, not only remain in approximation but actually unite. Disorder has begun, and when growth is renewed — as it soon is — the disorder becomes intensified in various ways. The mystery at present is, as to what is the initial cause of the disturbance.

ORCHID NOTES AND GLEANINGS.

CIRRHOPETALUM THOUARSII, Lindl.

This elegant little species, the type of the genus *Cirrhopetalum*, was first made known to science in 1822, when it was figured by Thouars (*Orch. Isles Afr.*, t. 98) as *Bulbophyllum longidorum*, with the statement that it was a native of Mauritius and Madagascar. Upon this figure Lindley based his genus *Cirrhopetalum*, calling the species *C. Thouarsii* (*Bot. Reg.*, 1824, sub t. 832). Unlike most others, this species soon got the character of being very widely diffused. In 1838, Lindley observed:—"This very curious plant is one of the most extensively diffused of all epiphytal Orchidaceae. I have specimens gathered in the Society Islands by Mr. Matthews; Reinwardt found it in Java; Thouars, in the Isles of France and Madagascar;

tinct groups, one in which the two sexes are very dissimilar in the perianth, and especially in the lip, the other in which these differences are comparatively slight. Of the former we have *C. ventricosum*, *C. Warszewiczii*, *C. pentadactylon*, *C. Rossianum* (of which both sexes are known), *C. aureum*, *C. maculatum*, and a few imperfectly known ones (of which the males only have hitherto appeared). Of the latter group we have *C. chlorochilon* and *C. Loddigesii* (of which both sexes have appeared), *C. Haagei* and *C. versicolor* (of which the females have yet to be discovered). Our knowledge of the genus is still very imperfect, but the materials are gradually accumulating, thanks to those who have kindly sent materials: of whom Messrs. Gotto, of Hampstead; Ross, of Florence; Rand, of Para, Brazil; and Houzeau, of Belgium, must be mentioned, because each have forwarded the two sexes of a species. Others have assisted, but the lucky moment has not yet arrived when they have been able to dispatch a box containing both sexes. Several of the species mention above are, I fear, not in cultivation at present, but we may hope they will reappear in time.

Respecting *C. Loddigesii*, Lindley's very interesting note will bear repeating. "In August, 1836," he remarks (*Bot. Reg.*, sub t. 1951*), "Mr. Wilmer, of Oldfield, near Birmingham, sent me a specimen of a *Cynochos*, which had broad petals, a short column, hooded and dilated at the apex, and a broad rounded lip, gibbous at the base, and with its stalk much shorter than the column. It was, however, destitute of scent, while *C. Loddigesii* has, as is well known, a delicious odour of vanilla. I had no doubt of its being a distinct species, and called it *C. cucullata*. But in the autumn of 1836, in the garden of the Horticultural Society, a plant of *Cynochos* produced from opposite sides of the same stem two racemes, those of one raceme were the well-known fragrant flowers of *C. Loddigesii*, and of the other the scentless flowers of the new *C. cucullata*." It may be added that *C. cucullata* does not appear to have been described; probably the second example appeared in time for Lindley to suppress it. It is a parallel case to the one now recorded. The flowers are a little more dissimilar than in *C. chlorochilon*, but, like it, the shape of the lip is very similar in each sex, not totally different as in the other group. *R. A. Rolfe, Herbarium, Kew.*

THE SEED TRADE.

KEEPING ONIONS.—When the Onions were harvested on the seed trial grounds of Messrs. Hurst & Son, at Chelmsford, last autumn, a number of bulbs of each variety were laid out upon shelves in a barn to test their keeping qualities. At the middle of May the best keeper was found to be the Red Wethersfield, an American variety of the Blood Red, and larger in size than the ordinary stock of the latter, and quite of the shape of Danver's Yellow. Scarcely one of these had started into growth; the bulbs were still sound and plump. Next in point of keeping quality came the Globe types. James' Long Keeping, an old and popular variety, and Bedfordshire Champion, together with the Giant Zittau, an Onion of the Nuneham Park type, with a shape midway between the globe and the flat, and, being of a pale salmon-brown colour, may be said to form a connecting link between the yellow-skinned and the pale red-skinned Onions. It will be remembered that a trial was made of this Onion a few years ago by Mr. Barron at Chiswick, and strongly recommended by him as a keeper.

As there is something akin to a prejudice against the Blood Red Onions in the London markets, owing both to colour and to the fact that they are supposed to possess a particularly strong flavour, it may be remarked that both conceptions are not altogether true in fact. The red colour of the Blood Red Onion is largely superficial, and if a bulb be severed in two it will be found that one or two of the outer coatings of flesh are highly coloured, while it pales considerably towards the centre. The flavour, too, is mild—much milder than is generally

supposed, and it is found in the case of the Blood Red Italian Tripoli Onion, which is at times brilliant in colour, that it is as mild as the White Italian Tripoli. But it is an opinion held by many that the strongest flavoured Onions are the best keepers. *R. D.*

PLANT NOTES.

LAGERSTROEMIA REGINÆ, *Roxb.*

In colour the flowers of this Asiatic tree are similar to the bracts of *Bougainvillea glabra*. During May many dozens of these trees are to be seen flowering in various parts of Port of Spain, the capital of the colony. One of the two growing in the Botanic Garden is especially deserving of notice, both for its large size and symmetrical outline; and it is made the more conspicuous, as it occupies a very prominent position on a lawn facing the east side of the Palace, the residence of the Queen's representative here, the Governor of the island. At the time of flowering, the trees become covered with panicles of light purple flowers. For planting up to form avenues, and such-like purposes, in the tropics, there is no tree more suitable than this; in habit and density of appearance it very much resembles the Horse Chestnut (*Æsculus Hippocastanum*). Being deciduous, there are times when it becomes completely bare, but the contrary is the case after the large leathery leaves are developed. The centre of the flower is yellow, due to the presence of numerous yellow anthers poised on the tips of slender filaments. The tree appears to seldom or never mature good seeds here. During the past three years, we have been unable to prove it fertile, though we have made numerous sowings of fresh seeds. *W. E. Broadway, Trinidad.*

NORANTEA GUIANENSIS, *Aubl.*

The habit of this plant, as growing in the flower-garden, is that of a shrubby, pendulous character, where it is exposed to the sun throughout the day. That it is quite at home in this position, is proved by its strong growth and constant flowering. From a horticultural point of view, the small dull violet-coloured flowers are not worth noticing, but the saccate-scarlet bracts growing singly from the base of each flower constitute the chief beauty of this plant. These grow at right-angles to the erect-growing flowers, and in shape may be compared to a powder-flask, the opening situated at the narrowed base. The flowers stand three or four deep on the upper side, and the bracts also three and four deep, but on either side of the raceme. The numerous bracts and flowers are crowded together over a length of 1 or 2 feet. The species is a native of Trinidad and the mainland of South America, where it is quite a common plant in the woodland districts, climbing to the tops of trees 50 to 60 feet in height. At a superficial glance, the red-hot-poker *Kniphofia aloides* of English gardens suggests itself. *W. E. Broadway, Trinidad.*

RUBUS DELICIOSUS.

With the exception of the Raspberry, which, on account of its fruits, is to be found in almost every garden, comparatively few members of this genus find a place in gardens, notwithstanding that several are really distinctly ornamental plants—such as the rampant-growing *R. biflorus*, with its white-washed-like stems; *R. chamamorus*, the cloud-berry, only growing a few inches high, with large white flowers, which are followed by reddish-orange fruits, of large size, when compared with the plant. Even some double-flowered forms of *R. fruticosus*, the common Bramble, are not without merit when planted in appropriate positions. In the species we are noting, *R. deliciosus*, we have an ornamental deciduous shrubby plant, producing annually, in May, a profusion of its large white flowers, from the ripened wood of the previous year, just after the manner of the ordinary Raspberry. It succeeds best if planted towards the front of a mass of shrubs—

or better still, if it can get a position in front of a wall. It throws up suckers, by which it may be increased, as well as by cuttings, both green and ripened. *F. R.*

THE HARDINESS OF JAPANESE BAMBOOS.

THE Bamboos, the noblest of all the Grasses, have not only the merit of utility, but the growth of many varieties is characterized by such grace and distinction that they are among the handsomest ornaments of gardens and plantations. Lately much attention has been given to some of the Japanese varieties, among which may be found widely distinct habits, ranging in height from 3 to 40 feet, and with foliage varying both in breadth and colour. In a small state many of these varieties are useful, grown in jars for in-door decoration—a use to which they are much put by the Japanese. Florists will find these useful additions to their stock of decorative plants, as they are not only light and graceful in effect, but they will help to break the monotony of the Palms. But their beauty is better shown when grown in large masses in the open air; where rightly placed, they have capabilities of striking effects in the landscape. *Bambusa Metake* has been long known in gardens, and is of undoubted hardiness; but there are numerous Japanese varieties which are now obtainable, and many of them will be of great value if they prove entirely hardy. Most of these are said to come from the warmer parts of Japan, but I have been much encouraged, in testing a small selection of varieties last winter, to believe that many of them are hardy in this latitude, and require scarcely any protection. The varieties tested were planted early last spring, and, while apparently well established, they made no great vertical growth. They were in rather stiff loam, where no stagnant water could remain at the roots. They remained during the winter without any protection to the stems, and with no mulch over the roots. Six of the seven varieties exposed passed the ordeal safely, and are now making vigorous growth. There was, however, an apparent difference in their resistance to severe weather, but this may have been due to less-matured growths. The past winter was not extremely cold, the thermometer only once dropping to zero, but was a fairly average one as to temperature and moisture. They having lived through this without the slightest protection, there seems no reason to think that they will not pass safely through an exceptionally severe winter if the roots are well protected by mulching. It might also be well to provide wind-breaks, though the foliage of most of the varieties could not probably be preserved during an ordinary winter under any protection in this climate. Such varieties as *B. Ragamowski* may be an exception in this regard, since they have hard, firm leaves which would be retained if protected from scorching. *B. Simoni* also has persistent foliage. In detail, the varieties tested are given in the order of apparent hardiness.

B. Simoni, leaves quite persistent, and plant untouched. *B. viridi-glaucescens* and *B. aurea* lost their leaves, but the stems were untouched. *B. Ragamowski* had its leaves scorched. *B. (Arundinaria) quilloi* lost its leaves, and its stems were slightly touched. *B. (Phyllostachys) nigra* (Koro-chiko of Japan), top killed, but now pushing from the roots. This black-stemmed variety is said to attain a height of 30 feet, which would indicate more vigour than it has shown with me.

B. angulata (variety with knotty joints) was entirely broken up, root and branch, by the frost. *B. Castelloni* (Kimmeichiku of the Japanese) was grown in the house, but is apparently as vigorous as the hardiest ones. Bamboos do not often show their distinct characteristics before the second year, and should be planted in permanent quarters. They form thickets by pushing out horizontal short-jointed stems in every direction. These emit roots, and break at every joint, so that a well-established plant soon becomes the centre of a large clump.

Of course, as these plants grow tall, conditions may arise which would prevent their being hardy in this latitude. For instance, an exceptional winter might cut the top growth severely if not matured, but the root-action is so strong that there seems little doubt that the damage would be confined to the tops even in the worst seasons. *F. N. Gerard, in Garden and Forest.*

FLORISTS' FLOWERS.

CARNATION DISEASE.

We have received several specimens this week of Carnations completely dying off from below upwards.

and attention bestowed upon them, by the pleasure to be derived from a daily survey of a rich harvest of imposing blossoms, which not only please the eye by their massive size and delicate colours, but have also that necessary addition which flowers require to make them perfect, viz., a delightful perfume. It is not often that a flower which becomes the rage of the season, and lays such hold upon the popular fancy, has the drawback of being so difficult to manage successfully, as do the various varieties of Malmaison Carnations; this fact alone seems likely to prevent the possibility of their becoming too common, for some time at least, till their cultural requirements are more generally understood. I trust, therefore,

atrive to obtain, but unfortunately do not always succeed in doing. The two-year-old plants carry from six to eight flower-stems, surmounted by one large bloom with four or five smaller side-blossoms. Standing on an elevated position near the large house in which these plants stand, a fine view is obtained of the huge pink flowers and opening buds, which present to the enthusiast a sight to be envied as well as admired.

As soon as the flowering period is over, the large plants are placed in the open air in the soil, which is naturally light and in good working order; here the plants are layered in the usual way, by first "wringing" the young shoots, and pegging them to the ground, taking care to place a little leaf-soil and sand around the layers to enable them to root quickly. This operation is performed at various times, from the end of July to the end of August, as the plants go out of flower. Some of the young plants are potted into 8-inch pots, and prove the most profitable the second year. When well rooted, which is generally about the beginning of October, the strongest layers are potted into their blooming pots, which varies from 5 to 6 inches in diameter, the weaker plants being placed in large 60's, and repotted in the spring. As the plants are potted up from the open air they are placed in their winter quarters, in light span-roofed houses, where they remain till the flowering period is over.

At all stages of their growth, Mr. Kitley considers careful watering has much to do with success, and he allows his plants to get much drier at the roots than many people would think beneficial, but that the practice suits the plants is clearly demonstrated by their robust health and their splendid blooms, a cultural achievement of which any cultivator may well be proud. Should anyone interested in the culture of these beautiful flowers happen to visit the neighbourhood of Warwick, during the next few weeks, I have no doubt Mr. Kitley will willingly show them his treasures, with his usual courtesy, and, having once seen, I am certain they will retain a vivid impression of so fine a show, an impression that will linger in the memory long after the flowers have faded. *H. Dunkin.*

FIG. 11.—DISEASE OF CARNATIONS, CAUSED BY EEL-WORMS.

On examination, we found the stems and leaves swarming with eel-worms (see fig. 11). As these creatures find entrance by the soil, we can only counsel burning the plants, and turning out the mould. There is no application that we know of that will cure the disease, or kill the animals without also killing the plant. High manuring might enable the plants to withstand the attacks better, but of this we are very doubtful.

MALMAISON CARNATION.

Those who have been fortunate enough to secure a good stock of Malmaison Carnations will, during the next few weeks, be amply repaid for the care

that a few cultural details, gathered from a highly successful grower of these popular flowers, will prove useful to the readers of the *Gardeners' Chronicle*.

Mr. J. Kitley, whose houses are near the grounds of the Castle gardens at Warwick, cultivates 2000 plants, and devotes three large span-roofed houses to their culture; one is filled with large plants in 7 and 8-inch pots, which were potted on last season, while the other two are occupied by splendid young plants in 6-inch pots, which were layered in July and August last, and are now carrying wonderfully fine blooms. The plants themselves are strong and sturdy, and the picture of health and cleanliness, just the type of plants which all Carnation growers

FORESTRY.

SEASONABLE WORK FOR JULY.

I HAVE just been inspecting a number of plantations formed at different times within the past thirty years on marsh ground and Irish peat bog, and such is their progress that I am warranted in recommending this class of ground to be planted as a source of profit and utility to the owners. Keeping in view the vast tracts of waste land of this class to be found in Great Britain and Ireland, this forms a subject of no mean importance to all who have the welfare of the country at heart. We shall, however, not dwell upon that in the meantime; my object being rather to point out that this is the best season of the year for draining bog and marsh land, as the work can be executed in a superior manner and at a cheaper rate during the heat of summer than at any other time during the year. The size and quantity of drains required must always be settled on the spot, and in accordance as the circumstances of the case may direct, but as a general rule it is best to have the work done by contract. The larger size of leader drains should be cut as near the margins of the plantations as the circumstances of the case will admit, and in many cases they can be utilised as the boundary fence. When large drains are cut in the interior of bog plantations, they prove a source of annoyance at the time of removing timber, and in many cases bridges require to be built to facilitate the operation, and as the erection and maintenance of such are expensive, the fewer the better. These hints should all be kept in view by the planter at the time of the formation.

This is likewise a proper time to fence, drain, and otherwise prepare hilly ground for planting, and in

all cases where stones and turf can be had convenient, they should be utilised for the erection of dykes around the margins, as they not only protect the plants from the inroads of deer, sheep, and cattle, but likewise afford considerable shelter to the plants at the start, and until they become inured to the climate of the locality. Wire fencing has been used of late for this purpose in many parts of the country, but practical experience and observation forbid us to recommend its use, as it affords no shelter, and is a source of danger to deer and game. In places where the soil is of a hard impervious nature, the spots where the plants are to be placed should be loosened or broken up with a tramp-pick to admit air, rainwater, and heat, by which means the cold dormant particles of the soil will be converted into an active fertile condition as food for the roots.

In the formation of mixed plantations, capacious pits had better be dug for the hardwood trees, and the stuff excavated left on the edge of the pit, exposed to the influence of the weather till planting time. In the formation of ornamental plantations, the ground had better be trenched at once; of course this will entail a little extra expense at the outset, but the superior growth of the trees in after years will amply compensate for this. It is best to have this sort of work done by contract; the average cost of trenching ground 20 inches deep is from £8 to £10 per acre. The price, of course, varies a little according to the state of the labour market, and the texture of the soil. Prepare ground for planting that has already produced a crop of timber, and in cases where the ground is not to be trenched, pits should be dug for the reception of the plants; these should be of such a size that the roots of the trees to be planted can be spread out to their full length without crossing each other; and as the work proceeds, pick out all chips, roots, and fragments of wood that may be in the soil, as a means of preventing the growth of fungus, which is inimical to the healthy growth of the trees, and sometimes causes their premature death.

If not already done, the stumps of Pine trees left in the ground that had been felled during winter and spring should be examined, and in cases where the Pine beetle and Pine weevil are found to be using them for breeding purposes, the bark should be removed at once, as it is always between the bark and wood that these pests deposit their eggs. Gather the bark, chips, and fragments of roots into heaps here and there, and burn them; spread the ashes over the surface of the ground, as it is very valuable as a manure. *J. B. Webster.*

THE HERBACEOUS BORDER.

SHIRLEY POPPIES.

To enjoy the full beauty of these flowers, seed should be sown in the autumn for early flowering, and in succession at intervals during the spring and early summer; they are perfectly hardy if not sown too early in the autumn. We find the second and third weeks in September the best time for this locality, as those sown before this period get too large and succulent, and are killed by the first hard frost. It is best to sow them where they are to flower, as they are rather impatient of removal, and never do well after. A row we have here, in full flower at the present time, is much admired; the seed was sown on September 27, and the plants are now nearly 4 feet high, the same in diameter, the row being 25 yards long, and full of flowers of various beautiful shades of colour. We find short branching sticks on each side necessary to support them; and if they are sown in large square patches, they are not much trouble in this way, but the flowers are then not so easily gathered. It is best to cut the flowers early in the morning, before they are fully open, and they will then last several days for room decoration. The most effective way of putting them up, is to mix some unopened buds and foliage with the expanded flowers, and some grasses with good foliage, such as the wild Oat, Couch grass

in flower, Wheat, Barley, or some similar kind; they should be cut at different lengths, and must on no account be crowded, or the effect will be spoiled; neither is it well to mix any other flowers with them. The flowers look, when in the bud, better than *P. somniferum* and *P. orientale*, and last in beauty longer, as the plants give a succession of flowers. *W. H. Divers, Ketton Hall Gardens, Stamford.*

NURSERY NOTES.

LILIES AT TWICKENHAM.

A GLANCE into the nurseries of Mr. H. A. Tracy, at Amyand Park Road, proves that the specialties of Orchids and Liliums have not suffered by his taking over the establishment. The large conservatory and an adjoining house contain a very fine show of *Lilium auratum rubro-vittatum*; the varieties of *Lilium speciosum*, among which *L. s. Melpomene* seems better than *L. s. cruentum*, which is also a good variety. Among the white forms, *L. s. album novum*, which is grown in quantity, proves a better flower than *L. s. Krätzeri*; and, in addition, the light yellow anthers of the former look better with the pure white flower than the chocolate ones of *Krätzeri*.

Lilium longiflorum and *L. l. Wilsoni*, true, are here for comparison, the latter having larger flowers than the common *L. longiflorum*, and often eight or ten on a stem.

Outdoors, are large beds of *L. Leichtlinii*, *L. Batemanni*, *L. Zovitzianum*, *L. auratum rubro-vittatum*, *L. a. virginale*; the various forms of *L. speciosum*, and most of the other showy Lilies.

Among the Orchids in bloom are some fine *Cypripediums*, *Cattleya Gaskelliana*, *C. Mendeli*, and *C. gigas* of great merit; and various *Odontoglossums*, *Acerides*, *Masdevallias*, *Saccolabium cœleste*, &c.

SCOTLAND.

CALCEOLARIAS AND CINERARIAS AT BEECHHILL NURSERY, EDINBURGH.

THE strains of Calceolarias and Cinerarias so carefully selected and improved by Mr. John Downie year after year, have been exceedingly fine this season. For brilliancy and purity of colours, the uniform compactness of their habit, the size and perfect form of their flowers, and the abundance of their inflorescence, they leave nothing to be desired. They average from 18 to 24 inches high, including inflorescence, with ample leaves, in 7-inch pots, the plants in many cases being as wide as they are high. Such perfect strains can only result from the most careful selection of the seed-bearing plants. *W. S.*

TEA AND COFFEE SUBSTITUTES.

(Continued from vol. 17., p. 768.)

COMPOSITEÆ.

82. *Silybum marianum*, Gaert.—In the Kew Museum is a sample of these seeds, or rather fruits, from Asia Minor, where they are known under the name of Kenguel, or Dene Kikeni. The plant is said to grow in all parts of Asia Minor, and the so-called seeds are roasted and used as coffee. A medicinal value is also imputed to them by the Turks.

URTICACEÆ.

83. *Humulus lupulus*, L.—The application of the Hop for the production of a non-intoxicating beverage is a novelty that has attracted some attention of late. It is stated that an Assam tea planter, at the close of the last Hop season, settled down on the Medway, near Maidstone, and with drying-machines and tea-rollers, as used in Assam, succeeded in making a kind of tea, which, though it cost twice the price of excellent Indian or Chinese tea, is likely to become an important

article for mixing with the better-known beverage of that name. The infusion is said to contain all the tonic, soothing, and nutritive properties of the Hop, and when mixed with tea proper, counteracts its astringent and tanning properties. A company has been formed in London for the sale of this tea, and it is now to be obtained from any grocer. A sample is shown in the Kew Museum. *John R. Jackson, Museum, Kew.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

BEDDING PLANTS.—These have generally made satisfactory progress, and from this date, the plants from which we have hitherto kept the blooms picked off will be allowed to flower. The only attention necessary, until the time for taking cuttings arrives, is to remove all faded flowers and leaves, and weeds, and affording water at the roots, when this is considered to be necessary. Pinch the points out of extra strong growths, and peg down the shoots of trailing plants as occasion may arise, so as to promote and maintain a symmetrical surface in the floral display made by beds filled with Pelargoniums, Calceolarias, Ageratums, Verbenas, Heliotropes, &c. In the matter of mixed beds, in which standard, bushy, and trailing plants are used in variety, care must be taken not to allow the stronger growers to smother the weaker ones, but let each have ample space to develop and appear to advantage. Large beds of mixed plants of irregular heights, with the colours somewhat regularly distributed, are certainly very effective, and contrast well when viewed in proximity to masses of scarlet, pink, yellow, mauve, blue, white, &c. Geometrical or carpet-pattern beds must have the dividing lines of the design, and the filling of the panels strictly confined each to its proper space, otherwise the effect as a whole will not be good.

BUDDING ROSES.—The bark of Briars and Roses is now in capital condition for operating on. The process of budding is well understood by gardeners and amateurs generally, but, nevertheless, there are many among the numerous readers of the *Gardeners' Chronicle* who would be glad to be initiated into the way of doing it, so I will briefly detail it. Select shoots containing plump buds of the desired varieties of the Rose to be budded, cut off the leaves and half the leaf-stalk, label and stand them on their butt-ends in a can containing water, so that they may be kept fresh until used. Then make a transverse incision about 1½ inch from the main stem, on the upper side of a stout shoot, and from the middle of this a longitudinal one extending to about 1 inch in the direction of the stem. Next remove a bud from one of the shoots referred to by taking it in the left hand, and inserting the knife about half an inch below the bud, and, with a clean sloping cut, pass the knife inwards well under the bud, and then slope outwards so that the eye shall be in the centre of the shield thus removed. In doing this, the knife will necessarily cut off a thin slice of wood with the bud; this should be removed by turning the cut surface upwards, holding the piece between the forefinger and the thumb of the left hand; enter the point of the knife between the inner bark and upper extremity of the wood, which raise a little to enable it to be laid hold of between the point of the knife and the nail of the thumb, and then, with a sort of twitch, remove the wood, being careful not to remove or injure the base of the bud. This done, with the thin handle of the budding-knife raise the bark on each side of the incision, commencing at the corners immediately below the cross cut. In raising the bark sufficiently to admit of the bud (held by the petiole) being gently pushed into position, be careful not to injure the cambium with the handle of the knife. Should the bark on either side of the bud be longer than the incision in the stock, cut a piece off the top end, so that the bark and cambium of bud and stock may fit closely together; binding the bud in position with bands of soft matting or worsted, in such a manner as to exclude air, and keep the bud on the alburnum, beginning at the end of the incision, and binding round and round to the top, allowing

the bud ample room between the turns and passing the end of the tying material under the last turn so as to secure it. An expert budder would pass a large quantity through his hands in one day. *H. W. Ward, Longford Castle, Salisbury.*

THE KITCHEN GARDEN.

ONIONS.—In late districts and cold soils, it is advisable to sow the Tripoli varieties for standing the winter about this date; but in warm soils and aspects, the second week in August is soon enough to sow. To make sure of a good crop, it is wise to sow twice where conditions are not favourable. These sowings usually prove very useful ones, the bulbs ripening in the height of summer. The seed bed should be deeply dug, and, if it be poor, a good dressing of well-rotted manure afforded. Avoid the use of very rich stimulating manures, which would result in a crop of bulbs with thick necks, difficult to get ripened. Fowls' dung, pigeons' dung, or night-soil, may be used—failing well-rotted farmyard manure. These should have been mixed with fresh soil, and thrown into a heap for some few weeks before being dug in. Do not use this compost in excessive quantities. There are two substances which I find of especial value for Onions, preventing the ravages of maggots and canker—these are soot and salt, which I sow on the land when it is being prepared for sowing, in quantity only just sufficient to colour the ground. Tread the soil moderately firm, and rake it to a fine tilth. The drills should be drawn very shallow, at 9 to 12 inches apart, and the seed sown evenly and thinly if it be new seed, or the plants will soon become drawn. The following are the varieties to sow at this season, viz., Mammoth, Silver King, White Elephant, White Leviathan, all of which grow to a large size, and are of mild flavour, but not long keepers. Daniels' Golden Rocca is the best hardy keeping Onion that I have grown, which will, when well grown, reach 2½ lb. in weight, and keep sound till January.

TOMATOS.—Keep the leading shoots secured to stout sticks, or to the wall, pinching off all side-shoots not required—the plants being neatly trained from the first, and allow the leading shoots to extend until fruits in numbers likely to get ripe during the season have formed. When this point is reached, stop the shoots, and mulch the ground with mild manure or leaf-mould. Tomato plants in pots put at the foot of south walls or other warm spots should be supplied with sufficient water, and occasionally with diluted liquid manure. Give them a mulch, if sufficient space can be found for it.

LETTUCES.—Seed may be sown in drills, if possible, in a part of the garden shaded by other taller-growing crops. Sow very thinly, and thin out the seedlings early to 9 or 12 inches apart, according to the size of the variety. Supply Lettuce with water in abundance in dry weather, and occasionally with manure-water.

Take up Shallots and Garlic as soon as the tops turn yellow, and properly dry the bulbs before storing them. Bend down the tops of winter-sown Onions to induce size in the bulbs. *C. J. Waite, Glenhurst Gardens, Esher.*

THE HARDY FRUIT GARDEN.

PEACHES AND NECTARINES.—The crop generally speaking is a good one, but it will be later than usual. Leave no more fruit than one to every 9 inches square, or if the tree has borne heavily before, or is weak from any cause, one to a square foot will be advisable; and the same may be remarked of Sea Eagle, Bellegarde [This variety rarely sets too many. Ed.], Stirling Castle, &c. Growers must be guided in a great measure more by the strength, vigour, and size of the trees; and all thinning of the fruits should be done forthwith. Continue to lay in the shoots intended to carry fruit next year; and to keep the trees well furnished with shoots of this kind, repeatedly pinch the small laterals; and trim off part of or remove leaves where they shade the fruits, thereby assisting them in acquiring good colour and fine flavour. Although of late much rain has fallen in this part, the borders where coverings are used will get dry near the wall, and should have attention in the matter of watering, especially if the soil is well drained and light; manure-water is of great assistance to trees bearing well, and this should be applied in moist weather before the borders become dry and hard. Keep the engine in frequent use—every day, if there is time. Should mildew appear, dust the affected parts with flowers-of-sulphur, and

syringe the trees over every part thoroughly in a week afterwards.

NUTS.—If the summer prove favourable, the crop of Nuts will be a very heavy one in most parts of Kent. The work amongst the bushes for the present will consist of the removal of suckers, and keeping weeds in check by hoeing in sunny weather.

With regard to suckers from Nut bushes, I would remark that while the bushes should, as a general rule, be kept clear of them, many growers of Nuts reserve a good quantity for the rods for fastening down of fruit-baskets when sent to market, a purpose for which they are very useful.

STRAWBERRIES.—As soon as the fruits have been gathered from the early varieties, trim off some of the lower leaves of the plants, and clear out the weeds and strawy mulching; and if the soil be poor, another and richer mulching may be applied. Keep the beds moist and the runners in check, giving each plant the best opportunity to make fine crowns by the autumn. Oxonian and other late sorts should be secured from the blackbirds, &c., and the fruit exposed on a mulch of clean straw. Remove every alternate plant, whatever the variety, where they have been planted thickly for the first year, so soon as the fruits have been picked. *H. Markham, Mere-worth Castle, Maidstone.*

PLANTS UNDER GLASS.

THE GREENHOUSE.—Cinerarias raised from seed sown this spring, and pricked off as previously directed, will now be ready for potting in 60's. It is of great importance that the plants should gain the requisite strength and sturdiness before the short days set in; and should they not possess both, it is useless to expect fine flowers, or to have these plants in flower by the beginning of the year—therefore all necessary attention should be given them. A compost that will grow the Cineraria well may consist of two parts loam, one of leaf-soil, and one of decayed manure, with plenty of silver-sand mixed with these other ingredients. After potting, place the plants in a cold frame, so far filled with sifted coal-ashes that the plants are brought up nearly close to the glass. After the roots have taken to the fresh soil, tilt the lights at the back during the day-time, and shade with some light material in bright weather; but at night the lights may be taken off altogether, the plants being much benefited by the dew. Another small sowing of Cineraria seed may now be made, the plants from which will bloom in the spring.

CHRYSANTHEMUMS.—These, now growing fast, will require regular attention in regard to watering, the tying in of the young growth, so as to prevent their being broken by high winds, and syringing over-head every evening when the weather is bright; and should any of the young shoots be infested with aphid, dust them forthwith with tobacco-powder.

COLEUS, FUCHSIAS, BALSAMS, ETC.—If another batch of Coleus cuttings be now put in, the plants will be found very useful for decorative purposes during the autumn. Fuchsias, &c., which have filled their pots with roots may be assisted about twice each week with applications of weak and clear manure-water.

STOVE PLANTS, SPRING STRUCK.—Young plants of Dracæna, Pandanus Veitchii, Crotons, Ixora, Bougainvillea, &c., if not already done, should be potted at once, so as to give them time to make as much growth as possible before the end of the season. These plants make good progress in a very short time, if proper treatment be afforded them—that is, not stinting them of pot-room, but repotting those whose roots have reached the outside of the ball, thus avoiding any chance of a check. Nothing is worse than allowing them to remain long in the cutting-pots after they are rooted, as they soon become stunted and weakly. One great point in the successful cultivation of plants is, to give to each kind the soil it is known to succeed best in. Those who will study the requirements of the different kinds of plants in the matter of soils, will find that the progress of the plants will be much more satisfactory than if the potting be done in a haphazard manner. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—Of all the Saccolabiums there is none that surpasses *S. celeste* when seen in its best form. I have had plants with as many as eleven spikes of flowers; but it should be borne in mind that the flower-spikes, if numerous,

should not be allowed to remain for a long period of time on the plants, or the latter will surely suffer. The plants succeed when grown either on a raft covered with living sphagnum moss, or in baskets hung up to the roof; for although it is a plant that suffers if it be not shaded during the hottest part of the day, yet it seems to enjoy a considerable amount of light and air; and during the warm weather the plant should have overhead syringings two or three times a day, which helps to keep the growths firm.

VANDA SANDERIANA is now sending up spikes of flowers. It is a plant which likes strong heat always, and I question if it be good practice to remove it when once a position is found to suit it. In such a position the roots will ramble apace and become attached to stages, walls, or any hard substances. It is supposed to be one of those plants which will always remain dear, and I would advise every amateur who can afford to buy it, to do so. Its varieties are variable, and out of about a dozen and a half of them, we have scarcely two that are quite alike in flower. I grow the plants in pots filled with crocks and sphagnum moss, and some coarse silver sand. I have grown the plant very well in a basket, but in watering it, many of the young roots got broken when immersing it. While the plant is growing it likes plenty of atmospheric moisture; our plants are stood in a group together, and roots and pots are syringed three or four times a day.

CALANTHE VEITCHII AND C. REGNIERI.—These plants, which are very strong growers, should now be stood wide apart, otherwise the growths will become spindly, and the foliage go yellow from want of air. From the present time, soot and guano water may be afforded them occasionally if previous calendarial notes have been followed, but it will not be advisable to give stimulants often if the plants have not been gradually brought to it. The syringing of these plants should be very carefully done, and only in the morning; on dull mornings it is better to thoroughly damp the pots and stages only, for if water run down in the hearts of the young growth at this part of the season, they may go off quickly. The maximum night temperatures may remain unaltered. *A. G. Catt, Parkfield, Hallow, Worcester.*

FRUITS UNDER GLASS.

PINE-APPLES.—The Queens, now ripening in quantity, will need less water, and no manurial aids. The bottom-heat should be kept up till the fruits are finished, for if checked in any way, the flavour will suffer deterioration, and the fruits have a shrivelled appearance; and as I advised in a previous Calendar, much may be done to prolong the fruiting period by admitting air rather freely, which will greatly increase flavour. This may be more easily done by transferring the plants at this stage to another house, where a less moist air is maintained, but where the bottom-heat is kept at a suitable pitch. The plants will not suffer in any way by this course of treatment. The night temperature for fruiting plants, at this stage, may stand at 70° to 75°. By removing fruiters, space is afforded the strong succession plants requiring it. Many of the earliest fruit will have been cut, and no delay should take place in potting up the strong suckers taken off for stock, putting them in 7-inch pots, or a size smaller for medium-sized suckers. Strong suckers are best obtained by pulling off all the small ones from the stools early—a proceeding that strengthens those which are left. Pot firmly in sound loam, and let the pots be well drained. Plunge in bottom-heat of 90°, using a pit or frame, and keeping a moist, growing atmosphere till rooted. I like frames if a good bottom-heat is obtainable to root suckers in at this season, as a short sturdy growth is made in them. The frame must be shaded at first, and water afforded with care, giving a good watering when potted, and again when the roots show at the sides of the ball. Lightly syringe the suckers on bright days, air freely, and shut up early in the afternoon. Any suckers potted early will now need a shift, which must be according to strength; in any case, do not cramp the roots in small pots. A check given to suckers at this date often causes small or badly-shaped Pines. In some gardens the strong suckers are planted out, but much will depend on the time at which fruit is wanted, pots being best if the plants are to fruit in a short space of time. Pines whilst growing should have liquid manure made from guano and soot, and this, if given in a weak state, is quite a safe stimulant. Late fruiters should be kept rather quiet for a time, so as to give them a rest. *Gro. Wythes, Syon House, Brentford.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

Fruit Culture.

THE extension of hardy fruit culture in this country should certainly receive a stimulus from the meeting held at the Mansion House on Tuesday last. The meeting was large—it was influential—the speeches were void of exaggeration, and generally to the point. There will not be much difference of opinion as to the merits of Bramley's Seedling, recommended in a letter from the Dean of ROCHESTER, as most people will endorse the commendation, but the Dean's statement that a cottager had paid his rent from the produce of two Apricot trees, suggests the question, "How often?" Those who peruse our yearly fruit reports, and those of our contemporaries, will have a vivid sense of the precarious nature of the fruit crop, and of the wisdom of the Minister of Agriculture in describing it as an adjunct to, rather than as a substitute for, other crops.

MR. CHAPLIN, whose speech we report in full in another column, had evidently greater hopes from butter and eggs than from fruit; nevertheless, he quoted some astonishing figures, which certainly show that very much more might be done in this country than hitherto has been done in the matter of supplying the tables of the lower classes with wholesome fruit. Lord EGERTON OF TATTON, who followed, pointed out the necessity for careful selection and packing, and adverted to the great extension of fruit-culture under glass round Manchester, the fruits grown being the Cucumber and the Tomato, both botanically fruits, but hardly so in a market sense.

SIR JAMES WHITEHEAD, who has done so much in this matter, alluded to the rejuvenescence of the Fruiterers' Company, and to the necessity for justifying its continued existence. He recalled the splendid show inaugurated under its auspices at the Guildhall last year, and advocated the restoration of neglected orchards, and the extension of fruit-culture in cottage gardens. How all this was to be done was detailed at length, but no new idea was thrown out, nor any proposal made that has not again and again been made public. The Baroness BURDETT COURTS made a true

womanly speech, full of sympathy for the labouring classes in the agricultural districts. She deplored the dullness of their lives, and the monotony and want of interest in their surroundings, as contrasted with the energy and variety manifest in town life. Anything that could brighten the home-life, and contribute to the welfare of the cottagers, was, in her opinion, a most desirable thing to encourage. In a low but clear voice, and with well-chosen words, the Baroness pressed her points home, and when she sat down those who heard her must have felt that, whatever difficulties and doubts there may be in the matter when looked at from a strictly commercial point of view, there could be no doubt as to the soundness and applicability of the views put forth by the Baroness from a "homely" aspect.

MR. H. R. WILLIAMS, in proposing a vote of thanks to the LORD MAYOR, alluded to the large consumption of jam in this country, and to its use as an ingredient in the penny dinners supplied at some of the Board schools. He, too, had his statistics, and though he could not tell his audience exactly how much sugar was used in the preparation of jam, it was certain that a large proportion of the imports was devoted to that purpose, the total quantity of sugar imported last year amounting to 1,247,977 tons! The extension of fruit culture, and the fabrication of jam, must therefore be a benefit at once to the home producer and to the Colonial cultivator.

The Medals and Certificates awarded at the Guildhall Show were then distributed, our correspondent, MR. WOODWARD, obtaining the premier prize of a gold medal.

So far well, we are all agreed as to the desirability of extending fruit culture. Speaking generally, we know what to do and how to do it. There is substantially no conflict of opinion as to the methods to be followed. We know what the broth should be, and how to make it and cook it. But we may ask if there is not some risk of the broth being spoiled by a multiplicity of cooks? This most laudable effort of the Fruiterers' Company is a new thing for it, and from anything that was said at the meeting on Tuesday, it might be assumed that it was new to other people as well, that the Royal Horticultural Society did not exist, that it had not organised conferences, or instituted trials and grown the best sorts for many a long year; that it had not published the most valuable reports in existence on the very subjects under discussion. Again, who would have guessed of the existence of the British Fruit Growers' Association, inaugurated for the very purposes, and pursuing identically the same methods as those which the Fruiterers' Company proposes to adopt? Who would have thought that the Society of Arts had taken part in the promotion of fruit culture? Who would have thought that the gardening press devoted many columns to the subject, and collected and published extended reports on the subject annually for many years past? Who would have thought, when the formidable list of lords, ladies, and gentlemen proposed to constitute the committee were mentioned, that there were, even at that meeting, not a few whose knowledge on the subject might be a little more extensive, and somewhat more trustworthy than that possessed by the distinguished individuals selected as representatives of the movement? The word "experts" was, indeed, casually mentioned, but no expert, so far as we noticed, was invited to contribute his experience. This, however, in itself, is not a matter of much moment. The Fruiterers' Company is worthy of

all commendation for the part it has taken. We can only recommend it not to ignore what has been done by others, but to combine its energies with those of some of the other societies, so that we may not have the waste of power engendered by half-a-dozen agencies simultaneously doing what one or two could do with greater effect.

MR. BULL'S WINTER GARDEN.—Visitors to Mr. BULL's annual exhibition of Orchids can hardly fail to note the winter garden, which forms the entrance to the brilliant show of Orchid treasures. To institute a comparison would be superfluous and irrelevant; suffice it to say, that the noble and stately Cycads and Palms, and the graceful tree Ferns give as much delight to the lovers of plants as the more highly-coloured Orchids. So majestic at all seasons are they, that it is a matter of wonder that public taste does not run more strongly in that direction. Of course, space is needed, but where that is forthcoming, no plants can be more imposing than these. Beyond strict attention to cleanliness, there is no special difficulty in the cultivation of these plants, which are far more in vogue on the continent than here. Mr. BULL's collections are very rich in interesting species, many of which have been figured from time to time in our columns, and we are glad to have the opportunity of giving a general view in our supplementary sheet, which may serve to suggest to those who scan it the stately grandeur of the plants. Intermixed as they were, when last we saw them, with Bermuda Lilies and Spiraea astilboides (one of Mr. BULL's specialties) the effect was particularly fine.

A MADEIRA GARDEN.—The Supplementary Illustration, taken from a photograph executed by one of our correspondents, MR. HARCOURT POWELL, shows the entrance to the garden of a Madeira Quinta. The tall, erect Cyresses, and the singular Dracenas, give a characteristic feature, which tells of a widely different climate from our own. To give anything like a complete list of the trees and flowering plants that adorn the gardens of Madeira would be a work of considerable labour. Let it suffice if we point out a few of the more conspicuous, such as the Camphor tree (*Laurus camphora*), the India-rubber tree (*Ficus elastica*), another *Ficus* (*F. comosa*), that grows to a large size, and puts forth handsome tressy foliage; the blue-flowered *Jacaranda mimosifolia*, the Tassel tree (*Astrapea Wallichii*), and a second *Astrapea* (*A. viscosa*), the spiny-stemmed Silk Cotton tree (*Bombax Ceiba*), the uncouth *Bella Sombra* (*Pircunia dioica*), common in Portugal; the so-called Pepper tree (*Schinus Molle*), with evergreen weeping foliage; the Coral tree (*Corallodendron Crista-galli*), and other species of the genus; two or three species of *Schotia*, many species of *Acacia*, the Papaw (*Carica papaya*), the Trumpetwood (*Cecropia peltata*), and the Screw Pine (*Pandanus odoratissimus*), the three last being strongly marked with a tropical aspect. The Papaw bears a Pear-shaped green fruit, of which no use is made. The juice has the property of making tough meat tender, and the same effect is produced by the leaves if the meat be wrapped in them. The Palms include the smooth-stemmed Cabbage Palm (*Areca oleracea*), the Date Palm, and two Fan Palms, the *Latania borbonica* and the *Chamærops humilis* of Portugal. The dwarf Cycas *revoluta*, though frequently called the Sago Palm, is not one of the true Palms. At the top of the stem, surrounded by a circle of leaves, there is often to be seen a number of red unfertilised fruit. Amongst the Coniferous trees will be seen the Norfolk Island Pine (*Araucaria excelsa*), the Brazilian Pine (*A. brasiliensis*), and two or three other species of the same genus, the graceful Canary Pine (*Pinus canariensis*), the gray Aleppo Pine (*P. halepensis*), and two New Zealand trees, the *Podocarpus nereifolia* and *Dacrydium cupressinum*. Amongst the Proteads are *Grevillea robusta*, with yellow flowers, *Banksia serrata*, and *Leucodendron argenteum*, with silvery leaves. The Myrtaceous trees include *Eucalyptus robusta*, and several other species of the genus, the

WINTER GARDEN AT MR. BULL'S, CHELSEA.

ENTRANCE TO THE QUINTA PALMEIRA, LIVADA, MADEIRA.

Gum trees and Stringy-bark trees of Australia; the Allspice (*Pimenta communis*) and the Rose Apple tree (*Jambosa vulgaris*), which bears an insipid fruit.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday next, the National Carnation and Picotee Society will hold its annual show in the Drill Hall of the Royal Horticultural Society, Westminster.

THE BRITISH FRUIT GROWERS' ASSOCIATION—**FRUIT PROSPECTS.**—At a meeting of the above Association, held in the Horticultural Club, Hotel Windsor, on Thursday, July 9, at 6 P.M., the ordinary routine business was transacted, and further arrangements were made for the various Conferences. It was announced that at Cardiff, on August 12, Mr. A. PETT-GREW would read a paper on "Hardy Fruit Culture in South Wales;" also that several other valuable papers had been promised. Two Vice-Presidents were added to the already long list of influential gentlemen—namely, CYRIL FLOWER, Esq., M.P., Aston Clinton, and H. L. STEPHENS, Esq., Finchley, both of whom are especially interested in horticulture. It was also stated that at the Beddington Park Conference, on August 3, Sir JAMES WHITEHEAD, Bart., would preside, and deliver the opening address, to be followed by short papers on different aspects of fruit culture. Reports on the condition and prospects of fruit culture had been received from numbers of members, some of which were read.

PROFESSOR PLOWRIGHT.—Dr. PLOWRIGHT, whose lectures on parasitic fungi at the Royal College of Surgeons we reported early in the year, has been reappointed Professor of Comparative Anatomy and Physiology at the College. His next course of lectures will be devoted to the diseases of the reproductive organs of plants caused by fungi.

JUBILEE OF "PUNCH."—Our Jubilee brother has followed our example, in giving a brief history of the men of light and leading who were among the earlier contributors to the renowned journal. *Punch* has deservedly won the suffrages of the community—long may it retain them.

FLOWERS IN SEASON.—We have received from Mr. G. SMITH, of 61, Penrose Street, Walworth, some flowers of a kind of Pink, with a perpetual flowering habit, and of bright, pleasing colours. The flowers (single) differ from *Dianthus diadematus*, or *fimbriatus*, in having a flatish, saucer-like form, and dentate instead of fringed edges to the petals; a dark eye adds to the attractiveness of the bloom.

EXTRAORDINARY STRAWBERRIES.—At the Crystal Palace National Rose Show on Saturday, the 4th inst., E. AMES, Esq., of Ashford Road, Maidstone, exhibited a dish of twenty Strawberries, weighing collectively 2 lb. 1 oz., and varying in size from 7½ to 8½ inches in circumference—very creditable for an amateur. The variety was James Veitch.

VIOLAS AND PANSIES AT CHISWICK.—A series of beds of these, planted with good varieties, contributed by Messrs. Donnie & Co., Rothesay, are just now charming features in the gardens of the Royal Horticultural Society. It is believed, by some persons, that these flowers do not succeed as bedding plants down south, but an inspection of these beds would demonstrate the fallacy of this notion.

BAILLON'S "HISTOIRE DES PLANTES."—The last issued part of this valuable publication contains the author's revision of the Labiatae, Verbenaceae, Ericaceae, and Illicaceae. Avicennias find a place in Verbenaceae, while under Ericaceae *Empetrum* is included as well as Epacridaceae and Diapensiaceae. *Cyrtillas* are grouped with Illicaceae. These examples show that M. BAILLON holds original views which are not likely to command universal assent. This, however, is a matter of little consequence compared to the clear descriptions, useful bibliographical references and excellent illustrations with which the book abounds.

DALSTON AND DE BEAUVOIR TOWN CHRYSANTHEMUM SOCIETY.—At a recent meeting,

called for the purpose of electing a President as successor to the late Mr. W. HOLMES, Mr. C. GIBSON, Morden Park Gardens, Mitcham, and Mr. J. UDALE, Caterham, were invited to lecture upon the present requirements of the Chrysanthemum. Excellent practical addresses were delivered by both cultivators; and numerous pertinent questions were asked and answered. Unanimous votes of thanks were accorded to the lecturers, and general satisfaction was expressed with a most agreeable and profitable evening. The credit of the success is due to the admirable arrangements made by Mr. A. HILL, Chairman; Mr. W. BUTLER, Hon. Sec.; and Mr. R. BALLANTINE, Chairman of the National Chrysanthemum Society.

THE "EARLY RIVERS" CHERRY.—Of this variety, Mr. T. F. RIVERS said lately:—"I venture to predict that this Cherry will some day be as popular as the Early Rivers Plum. I have now tested it for some years as a standard in the open air; for the last three or four years it has borne abundantly. It is now fully ripe enough for the market, and therefore some days earlier than the main orchard crops, which will not be ready for some days. This precocity will enable growers to compete with foreign Cherries, than which it is infinitely better in quality. It succeeds both on the Mahaleb and on the Cherry stock, and may be grown in rows 12 feet apart as semi-standards, which is probably the most profitable manner of growing fruit."

CARDINAL HAYNALD.—It is only a short time since we had occasion to speak of this eminent and erudite prelate, since deceased. He was an enthusiastic botanist and a man who won respect in all relations of life. He took part in the Botanical Congress at Florence in 1874, and one of the memorable incidents of that gathering was the meeting of VICTOR EMMANUEL and the Cardinal in the Pitti Palace. The Cardinal's tendencies were more botanical than horticultural, but many Orchid growers will recall his name by the *Cypripedium* which the late Professor REICHENBACH named in his honour.

HORTICULTURAL EXHIBITION AT BRUGES.—This is the second exhibition which the provincial Horticultural Society of Bruges has organised this year with complete success. T.R.H. the King, Queen, and Princess CLEMENTINE honoured the exhibition with a visit. After this, MM. COPPRETERS and WALLANT (the Vice-President of the Society, and G. VINCKE-DEJARDIN (a horticulturist), obtained the Cross of a Chevalier of the Order of Leopold. M. G. VINCKE-DEJARDIN showed about 600 tropical Orchids:—1, A group of great beauty, composed of about 400 specimens; 2, a fine group of *Odontoglossum Alexandrae*; 3, fifteen *Odontoglossums*; 4, twelve *Cattleyas*; 5, fifteen *Cypripediums*; 6, *Cattleya Mendeli*, with fifteen flowers, shown as an example of good cultivation; 7, *Vanda tricolor Vinckeaana*, as a novelty. Very noteworthy were the tall Palms from M. DUMON DE MENTERG, *Cocos Yatai*, *Jubaea spectabilis* (of unusual size), *Kentia Mooreana*, *Corypha australis*, and *Rhaphis flabelliformis*. Very fine also were the Palms sent by M. GUST. BAERT, and the hybrids of *Anthurium Andreanum*, from M. G. VINCKE-DEJARDIN. The floral decorations of Mlle. VINCKE, of Ostend; and M. J. VERHAEGHE-RYS, of Bruges, were above the average.

THE EXHIBITION OF THE "CERCLE HORTICOLE LOUIS VAN HOUTTE, OF LEDEBERG," which will be opened on August 23, promises well, and will be one of the events of the horticultural year.

THE ANTWERP INTERNATIONAL EXHIBITION (August 9 to September 23), promises to be a complete success. Very interesting and curious collections of vegetable products will be there shown, and also microscopical exhibits. The permanent horticultural show (Japanese, Chinese, Californian, Australian, and Cape flowers) bids fair to be excellent. The date for the opening of the temporary horticultural exhibition is fixed for Sep-

tember 13. Programmes of both exhibitions can be obtained from M. CH. DE BOSSCHÈRE, Lierre, Belgium.

THE DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—At a meeting held on June 13, the Floral Committee awarded the following First-class Certificates for new plants:—To Messrs. De Graaff Brothers, Leiden, for *Brodiaea Hendersonii*, Iris Gatesii, and I. Boissieri; to Messrs. E. H. Krelage & Son, Haarlem, for Iris Boissieri (new plant), and *Allium Kesselringii*; to Mr. G. C. Van Meeuwen, Haarlem, for *Dodecatheon elegans* var. *albidum*, D. e. var. *Gladstone*, D. e. var. *Novelty*, and *D. Jeffrayanum* var. *Celinda*; to Messrs. Ant. Roozen & Son, Overveen, for *Pasithea cœrulea* (insufficiently-known plant), *Pyrethrum roseum* var. *Camelot* (new plant), and P. r. var. *Carl Vogel* (new plant); to the Botanical Garden, Leiden, for *Vriesia insignis* (*Vriesia Barilleti* × *Vriesia splendens*); to Mr. C. G. Van Tubergen, jun., Haarlem, for *Crinum Moorei* album. Second Class Certificates were awarded to Messrs. E. H. Krelage & Son, Haarlem, for *Pæonia Moutan*, Linn., var. *Loudonia Burdin* (insufficiently-known plant); and Botanical Certificates to Messrs. E. H. Krelage & Son, Haarlem, for *Allium Kansuense*, Rgl. (new plant); *A. schoenoprasoides*, Rgl. (new plant); *Ranunculus asiaticus*, L., var. *La Singulière*, Hort. (insufficiently-known plant); *Tristagma nivalis*, Popp & Endl. (insufficiently-known plant). Awards of Merit were made to Messrs. De Graaff, Bros., Leiden, for *Allium acuminatum*, *A. orio-phyllum*, *A. Ostrowskianum*, and *Lachenalia quadricolor*.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of this Society was held on Monday evening last, at the Caledonian Hotel, Adelphi, Mr. E. BEARY in the chair. The principal business was the election of new members, no fewer than tw elve being elected and another nominated. The list of those who have been in receipt of sick-pay is rather a heavy one, but at the present date there are but two members on the fund. It may not be generally known to new members that a convalescent fund was established last year for the purpose of assisting members to get a change of air after illness. Ten shillings per week would be allowed for three weeks. The subscriptions are not less than one shilling per year, payable in July. The fund is voluntary.

HEMEROCALLIS FULVA.—Professor HARTOG writes, "I shall be grateful to any of your readers who will write and let me know their experience as to the variability of seedlings of *Hemerocallis fulva*, or who will raise it from seed in fair quantity, and kindly communicate to me their results, which shall be duly acknowledged. My reason is the following: there is in the formation of the pollen of this plant a peculiarity which, according to WEISMANN'S views, should lead to exceptional variability in the seedlings; but so far as I know, we have no evidence on the subject. MARCUS M. HARTOG, *Royal University, Dublin, July 9, 1891.*"

READING GARDENERS' SOCIETY.—On Friday last a large party, representing the above Society, about sixty in number, visited the seed trial grounds of Messrs. SUTTON & SONS, adjacent to the Great Western Railway at Reading. They inspected the large collection of Peas, and witnessed the operation of "rogueing" Peas in order to secure purity of stock; also a trial of Lettuces. They then partook of a tea at Messrs. SUTTON & SONS, afterwards inspecting a large plantation of Potatoes; and a collection of annuals and perennials now in full bloom. The members of the Society seemed much interested by what they saw, and before leaving passed a hearty vote of thanks to Messrs. SUTTON & SONS.

CUCUMBER DISEASE.—Several subscribers have this week sent young Cucumbers arrested in their growth, distorted, and exuding gum. Some of them also send roots with the nodules showing the source of the mischief. Unfortunately, although the malady is very common, we can indicate no sufficient cure.

NEW BOOKS.—A fifth edition of PIESSE'S *Art of Perfumery* has been published at 2, New Bond Street. Under the title of the *Making of Flowers* the Rev. Professor GEORGE HENSLAW has published a clear account of the conformation of flowers, and has advanced a theoretical "reason why," to which we must allude at further length on another occasion. The new edition of the *Book of the Farm* has been completed by the issue of the sixth division. (WILLIAM BLACKWOOD & SONS, Edinburgh.)

THE SILVA OF NORTH AMERICA.—It is not long since we had occasion to announce the publication of the first volume of this highly important publication. The second volume has now been published, and we shall take an early opportunity of bringing its contents under the notice of our readers.

TREE STRUCK BY LIGHTNING AT THE ROYAL BOTANIC SOCIETY'S GARDEN.—For the first time in its history, the Royal Botanic Society has had a tree struck by lightning. A Poplar was on the 9th ult., at 4.30 p.m., during the thunderstorm, stripped in places of large pieces of its bark and timber. Some workmen, who were busy preparing for the *fête*, were close to the tree, but, sheltered beneath the wet canvas of the adjacent tents, they suffered no hurt.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The Exhibition of the above will be held in the Drill Hall, James Street, Westminster, on Tuesday, July 21. A luncheon, at which MARTIN R. SMITH, Esq., Vice-President of the Society, has kindly consented to preside, will be given at the Hotel Windsor, Victoria Street, at 1.30 p.m., for members and their friends.

MARSHALL VON BIEBERSTEIN.—Among the suite of the German Emperor lately in this country, is the Foreign Minister of that name. How familiar it sounds to the botanical ear. The *Flora Taurico-Caucasica*, indeed, will be consulted long after the present Minister's despatches are forgotten!

FLOWER-BEDS ON THE EMBANKMENT.—Among the flower-beds to be seen in this garden is one bed of a different character which is very beautiful and noteworthy. It is composed of Verbenas of various shades of colour, intermingled among which are dwarf plants of white *Palox Drummondii* and double Stocks. Similar beds under the shade of trees are not successful. Another bed of a long oval shape is planted with the dwarf-growing *Zinnia flagellata* in variety, with double flowers; purple and scarlet flowered Verbenas, and *Convolvulus tricolor*, with an effect truly kaleidoscopic. The result is very beautiful, as seen in the beds in the full sun, and in marked contrast to the atrocious carpet beds. There are people who admire these triumphs of misplaced ingenuity, and, to a certain extent, it is right that their faucies should be catered for, but the County Council has done well to show a more excellent way, and thus gradually to improve the taste of the community.

PELARGONIUM GLOIRE DE PONTHEVIN.—The beauties of this large variety as a winter, or almost perpetual bloomer, are well exemplified in the greenhouses of P. G. WALTER, Esq., Byron Villa, Harrow. Taking the best truss, enumeration proves that it has already given seventy-eight flowers, nearly 2 inches across, of a soft shade of scarlet; and yet there are plenty to come. The pretty pink *Pelargonium Beauté de Ponthévin* has also proved a very showy plant, and a profuse bloomer.

MR. A. DEAN.—"Would you kindly allow me," says our old correspondent, MR. A. DEAN, "to make known to my numerous gardening friends, through the medium of these columns, that, after nearly twenty-one years' residence at Badfont, I am leaving on July 25, and shall be residing in the Richmond Road, Kingston. I am naturally somewhat loth to leave active gardening, as practised in seed-growing, &c., but my health demands that I should rest from mercurial work, as well as from the grave anxieties which attach to seed-growing. I hope none the

less to have many more opportunities than I have here to become familiar with gardening in other branches."

PEAS.—MR. CANNELL sends us a sample of his "English Wonder" Pea, an improvement on American Wonder, and one of the best early Peas. It was sown a month later than "Lightning," but comes into use at the same time.

MONSTROUS NYMPHÆA.—From Cherkley Court we receive flowers of this curious variety of *N. Lotus*, in which the petals are replaced by leaves, the stamens are abortive, and the place of the fruit, or seed vessel, occupied by a fleshy tuber.

BARON SCHRODER.—Among the German residents selected for honourable distinction by the German Emperor, is this renowned horticulturist. Those who have the pleasure of knowing him, will rejoice in the conferment of honours fairly won.

GLASGOW FAIR HOLIDAYS AND ROYAL BOTANIC GARDENS.—We learn from the *North British Daily Mail* that the Finance Committee of the Corporation have decided to open the gardens to the public, free of charge, during two weeks beginning on Monday first.

STRAWBERRIES.—On Friday week, 33,000 pecks of Strawberries left Swanley for the north of England, and 5000 for London on the same day.

TIBETAN PLANTS.—The last number of *Le Jardin* contains an account of the plants collected by M. BONVALOT and PRINCE HENRI, of Orleans, from Tibet. Among them, a species of *Meconopsis*, one *M. henrici*, with purple flowers, like those of *M. simplicifolia*; *Thermopsis barbata*, with racemes of purple flowers, figured in the *Botanical Magazine*, t. 4868, but almost, if not quite, lost to cultivation. *Leonopodium alpinum*, and *L. himalayense*, are not likely soon to be exterminated in Tibet. Among the Lilies is a Fritillary—*F. lophophora*—with yellow flowers speckled with brown; and many other interesting plants.

CHERRIES.—A Sittingbourne correspondent writes, that "So great was the havoc wrought by the frost about May 17 last, that many trees will be years before they can recover; and to give an idea of the loss to growers, I may mention some noted orchards, the produce of which, this year, only realised £475, whereas I have known as much as £1200 obtained; and last year, 1890, £959 was paid. The prices returned to us on Tuesday last for Cherries sold at Covent Garden were—Blacks, 5s.; Ambers, finest, 8s. per half sieve, or at the rate of 2½d. and 4d. per lb. Out of this, the grower has to pay 6½d. per half sieve for expenses."

HOME CORRESPONDENCE.

CABBAGES "BOLTING."—Both "W. G. II." and "A. D." appear to have missed the drift of my note on this subject in your issue of the 13th ult., p. 740. If they care to look over that note again, they will, I think, find I was anxious rather to elicit information than to dogmatise over local conclusions as to the causes of "bolting" of Cabbages this season in Scotland or elsewhere. The several causes stated by me were distinctly given as those assigned by individual sufferers by the disaster, and my own comments thereon were intended to evoke discussion on a point of deep interest to market gardeners and to the public. There is considerable diversity of opinion among practical men as to the cause of "bolting" of spring Cabbages; and it would be desirable to have the fullest possible expression of opinion upon the subject. "Bolting" is not an annual occurrence, fortunately; it does not occur every spring. It hardly ever happens, I venture to say, to any serious extent in ordinary seasons, except from too early sowing and the selection of unsuitable varieties for autumn planting. I think, however, that there is little reason to doubt but that a severe winter has something to do with the evil. "A. D.'s" opinion to the contrary notwith-

standing. If accounts which reached us of the weather experienced in the south last winter are to be trusted, we in the Lothians escaped lightly both in respect of actual frost and snow; but it was less cold and snow—indeed, of the latter, we had unusually little—the winter was prolonged, and extremely trying to green stuffs in a peculiar way. I stated in my former note that we had a severe winter up till February, when we experienced four weeks of genial growing weather, followed by a second winter, which continued to the end of May. It would be interesting to know if your correspondents' experience was similar to ours in February in their several localities. It would, then, at least be possible to arrive at a conclusion regarding the value of my contention that much, if not all of the "bolting" which occurred in the Lothians was due to the interregnum of the Ice King's reign in February, followed as it was by extreme severity of cold in March, April, and May. The general "bolting" that took place in this district last spring is not to be satisfactorily accounted for by "A. D.'s" assumption that the "stock was at fault." The growers, as a rule, can rely on the stocks they sow being right; the seed is, indeed, in many cases saved by the growers themselves. I must correct "A. D." in the conclusion he draws from my remarks respecting the relative hardiness of Scotch stocks and English stocks of Cabbage. I did not "claim" for the former that they were harder than the latter, but stated for what it was worth, that such an opinion was entertained by practical men in these parts. The only point requiring to be noticed in "W. G. II.'s" contribution to the discussion is, that *Etampes* is a variety that succeeds with him, though further north than the Lothians. It is interesting to know this, but it does not alter the fact that the variety is not approved of by the Lothian growers, who have tested it, and found that it is not so reliable as the *McEwan*. In my former note I said, while speaking of this variety, that it was later than *Pringle's Imperial* and *Worcester Early*. This is an error; it is somewhat earlier. W. S.

WOOD-PIGEONS IN LONDON.—On June 11, I noticed to you the fact of having seen a wood-pigeon in St. James's Park, opposite Marlborough House. I was not aware till a few days ago, when I saw it in an evening paper, that there is a colony of them in the park. This morning, at 5 A.M., I was awakened by the cooing of a wood-pigeon, which was on a tree close to my window, and as there is good shelter for them in the large Plane trees in the garden, I suppose we may have them settle here in the garden between Clarendon and Lansdowne Roads, Notting Hill. Thrushes and blackbirds we have, and very welcome is their song in its season, except to one frequenter of the garden, whom I overheard complaining, "that it would be very nice living out here, but for a beastly bird which began singing so early in the morning." J. A. C.

THE PAST WINTER NEAR ABERYSTWITH.—I am now able to send you a few of the results of the late severe winter on plants which are not commonly grown, on account of the doubts which exist as to their hardiness and power of surviving such a winter as the one we have just experienced. I ought first to state that this garden lies on the slope of a steepish hill, facing south-west, and is about a mile and a half from the sea. The lowest temperature was 17° (15° of frost) at 4 feet from the ground. I will begin by enumerating the very few plants which have been killed outright:—*Cordylina australis*, all killed; *Phoenix dactylifera*, a very large plant of *Eryngium pandanifolium*, *Cytisus racemosus*, all the shrubby Veronicas, with the exception of *V. Traversi*, which was unharmed; and all the *Pentstemons*, which had stood out for some years. Those that were injured comprise the *Myrtles*, which were cut a good deal, but are rapidly being covered with new foliage, right to the tops; *Aloysia citrodora*, cut down to the ground; the largest plant, twelve years old, is now breaking at the side next the wall, where the stem, which is more than 2 inches in diameter, has a slight coating of bark left; a younger plant is breaking well; *Phormium tenax* had the centre leaf in each crown a little browned, but otherwise is unharmed; *Aralis Sieboldii* was a little blackened, but is now nearly covered with new foliage; *Ceanothus rigidus* was cut a good deal, but has now recovered; the scarlet and yellow Pomegranates were cut to the ground, but are now breaking well. At one time I was afraid that a fine plant of *Passiflora Constance Elliott*, which last year had hundreds of blooms, would not recover, but it is now nearly covered with

healthy foliage; and as it is planted in a rather exposed spot, it may be considered quite hardy. Among those that have been quite unharmed, I would first note the Bamboos, which actually seem to have enjoyed the cold; *Chamærops Fortunei*, *Ceanothus Gloire de Versailles*, which is now coming into bloom; *Bocconia cordata*, which grows 10 feet high here; *Solanum jasminoides*, *Cistus ladaniferus*, *Buddleia globosa*, now covered with golden balls; *Olearia Haastii*, *Escallonia macrantha*, *Euonymus* of sorts, *Prunus Pissardi*, *Garrya elliptica*, *Azalea amœna*, *Eulalia zebрина*, *Deutzia gracilis*, *Zauschneria californica*, the Indigo plant, *Physalis Alkekengi*, *Alstroemeria chilensis* and *braziliensis*, *Lilium speciosum* and *L. elegans*, and a clump of *Echeveria glauca*, on a rocky. Of Ferns, I see *Oncoclea sensibilis* coming up very strong; but, before finishing, I must mention a plant of *Ficus minima* repens, which four years ago was turned out of an Orchard-house, on account of small slugs harbouring under the leaves, and planted under a wall. I enclose a shoot of it, to show what an effect the change of residence has had upon the foliage, as when grown indoors the leaves were three times as large. In conclusion I would mention that none of the plants alluded to have had protection of any kind. *G. W. Cosens, Bronnpularn, Abergystwith.*

MOLES.—It is my experience this year that slugs were never before so few, and moles so abundant. I should imagine that of the latter pests there must be ten where before there had been only one. The ground seems to be literally honeycombed by the creatures, and as we walk over it the surface sinks in deeply beneath the tread. Why there should be such a number of moles this year, it is indeed difficult to understand. It is certain that hard weather had no terrors for them; but then, in spite of a long period of unusually hard frost last winter, because the ground was so long covered with snow, the frost did not penetrate so deeply as is often the case when winters are less severe. It was generally expected that the long hard winter would have destroyed both slugs and snails, and I anticipate in my district such was the case. Still, we may learn that others have not been so fortunate, and are terribly pestered with these creeping plagues. Perhaps the comparatively dry weather has something to do also with the scarcity of slugs, but at least I have never found them, even in the driest weather, at this time of the year, to be so scarce as now. As to the moles, they run so near the surface, especially in ground which has been recently moved, that it is almost impossible to trap them. Still further, when one is surrounded by extensive market gardens, now full of Peas, Beans, Potatoes, Cabbages, and similar crops, amongst which hundreds of moles run riot and undisturbed, it is obvious that any one's prospects of keeping down the moles is very poor indeed. We could do well with a good heavy rain, to assist in setting the soil, but when it is literally one vast mole burrow, there is needed some greater pressure to solidify it than the heaviest of rains can well give. *A. D.*

CAMPHOR AS AN INSECTICIDE.—To kill greenfly on *Lilium Harrisii*, I found a means worth trying in an old German gardening paper. The correspondent took a small piece of camphor, and put it between the top leaves of the affected plant, and in a short time none of the insects were to be seen. As the camphor evaporates, it has to be renewed when necessary. *A. B., Bewley Heath.*

EARLY TOMATOS.—With me Horsford's Prelude is by far the best Tomato that I have tried for early forcing; it is a remarkable free setter, of excellent flavour, and of medium size, and globular. Were I confined to three varieties, I should choose Prelude, Perfection, and Hackwood Park. *W. K., Blackmoor.*

PRUNING GOOSEBERRIES.—It is scarcely the time of year to speak about Gooseberry pruning, but I think Mr. Laxton's remarks at the Fruit Conference last week were not far wrong. How often may one notice in a cottager's garden, Gooseberry bushes loaded with fruit, whereas in the neighbouring highly-kept gardens at the mansion, where the trees are annually pruned in a scientific manner, hardly a Gooseberry is to be seen! I have these last few years simply thinned out the shoots a little where too crowded, and by scaring the bullfinches, &c., with the gun, and syringing the trees twice with unslacked lime-water, I have always secured good crops. No doubt the non-pruning system would not do for growing show fruit; but good fruit in quantity is grown on this plan. The washing with lime-water

kills moss and insects, and thus helps to keep the trees in a healthy state. A coating of rotten manure should annually be given, which will maintain bushes in vigour for a surprising number of years. *W. K., Blackmoor.*

THE WEATHER IN KENT.—Since July 7, much rain, and showers of rain and hail together, accompanied by thunder, have occurred. A storm which came up suddenly on the 8th, and lasted for an hour and a half, flooded the gardens, and it was followed by a hail-storm, the hail laying for more than an hour. Some of the hailstones measured three-quarters of an inch in diameter, but not being so icy as is usually the case. No glass was broken, but the crops were much riddled, and the flower-beds wrecked for several days; but these last are now fast recovering their beauty. The thermometer, which fell 4° on that occasion, has not been so high since. The beds of Noble and other varieties of Strawberries, covered with hexagon netting, afforded a curious contrast of large red fruits against the covering of hail which lay on the ground all around. *W. Divers, Weirton House, Maidstone.*

SOCIETIES.

ROYAL HORTICULTURAL.

STRAWBERRY CONFERENCE, JULY 8.

Silver Banksian Medals.

To Messrs. Paul & Son, for Collection of Strawberries.

To Messrs. G. Bunyard & Co., for Collection of Strawberries.

Certificates of Merit.

To Mr. T. Laxton, for Strawberry White Knight and Scarlet Queen.

To Mr. W. Allan, for Strawberry No. 2, No. 3, No. 4, Sir J. Paxton, President, and The Countess.

To Mr. Edwin Amies, for Strawberry Laxton's Latest of All.

To Messrs. Paul & Son, for Strawberry Vicomtesse Héricurt de Thury, Sir J. Paxton, Pauline, Anguste Nicaise, President, and King of the Earlies.

To Messrs. G. Bunyard & Co., for Strawberry Oxonian, Countess, Lucas, Latest of All, Elton Pine, Anguste Nicaise, British Queen, and Dr. Hogg.

To Mr. J. Watkins, for Strawberry Vicomtesse Héricurt de Thury and Sir J. Paxton.

List of Awards.

FLORAL COMMITTEE.

Awards of Merit.

To *Centaurea cyanus nanus compacta*, Mr. Herbst.

To *Godetia White Pearl*, Messrs. J. Carter.

To *Paeony Mme. Emile Galle*, Messrs. Paul & Sons.

To *Veronica anomala*, Messrs. Paul & Sons.

To *Prunella Webbiana*, Messrs. Paul & Sons.

To *Rose Reine-Blanche*, Mr. B. Ladhams.

To *Pink The Rector*, Mr. E. Turner.

To *Mimulus cupreus Prince Bismarck*, Messrs. J. Laing & Sons.

To *Escallonia lomensis*, Messrs. J. Veitch & Sons.

To *Delphinium Robin Adair*, Messrs. Kelway & Sons.

To *Double Begonia Mrs. Falkner*, Messrs. H. Cannell & Sons.

Botanical Certificates.

To *Lilium maritimum*, Mr. T. S. Ware.

Commended.

To *Gaillardias strain*, Messrs. Kelway & Sons.

Medals.

To Messrs. J. Laing & Sons, for Collection of Hardy Flowers, Silver Gilt Flora.

To Messrs. Paul & Son, for Collection of Hardy Flowers, Silver Flora.

To Mr. T. S. Ware, for Collection of Hardy Flowers, Silver Flora.

To Messrs. Kelway & Sons, for Collection of Hardy Flowers, Silver Flora.

To Messrs. J. Veitch & Sons, for Collection of Hardy Flowers, Silver Flora.

To Messrs. Barr & Sons, for Collection of Hardy Flowers, Silver Banksian.

FRUIT COMMITTEE.

To Mr. T. Coomber, for Queen Pines, Silver Medal.

To Mr. J. Watkins, for Apples, Bronze Medal.

To Mr. J. Fitt, for Banana Ladies Finger, First-class Certificate.

Scientific Committee.

JUNE 23.—Present: Mr. D. Morris, in the chair; Mr. McLachlan, Dr. Müller, Rev. W. Wilks, Sir J. D. Llewellyn, Rev. G. Haslow, Hon. Sec.; Mr. C. A. Barber, and Mr. R. A. Rolfe, visitors.

Erecrescences on Willows.—With reference to the specimens brought by Mr. Blandford to the last meeting, and referred to Professor H. Marshall Ward for an examination of the tissues, he reported that there was no evidence of any fungus growth, and Mr. McLachlan added that there was also none of insects having ever been present. Hence the true cause of the hypertrophy could not be ascertained.

Papaver pilosum (?).—This plant having been referred to Kew, was ascertained by Mr. Baker to be *Papaver rupifragum* var. *atlanticum*, and is figured in the *Bot. Mag.*, t. 7107. It is a native of Morocco, *P. rupifragum* being a native of Andalusia. Mr. Wilks observed upon the fact that there are a great number of Poppies now in cultivation which require a careful systematic treatment.

Iris, Petals Variegated.—Mr. McLachlan exhibited three petals, half white and half purple, which appeared on a single plant of *Iris florentina*. The question was raised whether the plant was a white variety of *Iris germanica* reverted. It was referred to Kew for further consideration.

Scotch Fir and Larch attacked by Chermes.—Mr. R. Maker, of Yattendale Court, Newbury, forwarded specimen branches of these trees infested with species of chermes. The only remedy is the free use of paraffin spray. At Kew, Mr. Morris observed, they were obliged to cut down some trees growing in the midst of others; as from their height and crowded condition the spray could not be used effectually, and the only alternative is to destroy the infested trees.

Ash Wood Disease.—He also sent specimens of branches having the common cankerous-like hollow places on them. They were from an old tree 18 inches in diameter and a foot from the ground. The trunk and all the branches presented a similar appearance. They were referred to Professor H. Marshall Ward for further investigation. Mr. McLachlan observed that the Weevil *Hylesius Fraxini*, or else the larva of a moth *Myelos pinguis*, which feeds beneath the bark, might possibly have been the primary cause of the injury.

Cynochos chlorochilon (Klotzsch).—Mr. Rolfe exhibited what is apparently the male flower, as the column is very slender, and the pollen normally developed. This is a well-known garden plant. In addition he showed another form, being a larger flower with a short stout column, which is believed to be hitherto unrecorded, and is supposed to be the female flower of the same species. These two flowers appeared upon separate individuals imported from Caracas as *C. chlorochilon*. They flowered in the collection of M. A. Houjean de Lehaie, Membre de la Chambre des Représentants, Hyon (Mons), Belgium. The special interest attached to the present examples is the great similarity between the two sexes, a character also observed in *C. Loddigesii*, while in *C. ventricosum*, *C. pentadactylon*, and *C. Rossianum*, the male and female flowers are very dissimilar. *C. Egertonianum*, the male of *C. ventricosum*, is a familiar example.

Elm, with Coloured Wood.—A branching specimen in full leaf was exhibited by Mr. Morris. It was received many years ago at Kew from Van Houtte, under the name of *Ulmus* sp. *libero-rubro*. This is believed to be only a form of the Scotch or Wych Elm, *Ulmus montana*. The peculiarity possessed by the specimen consists in its having the wood immediately beneath the bark of a bright pink colour, which easily distinguishes it from the type. The exact nature of the colouring substance in this instance does not appear to have been investigated.

WOODBIDGE FLOWER SHOW.

The fortieth annual flower show in connection with the Woodbridge Horticultural Society was held, in fine weather, on Thursday 9th inst., in the beautiful Abbey Grounds, which were again placed at the disposal of the Committee by Captain J. R. Carthew. In the open classes there were five collections of forty-eight distinct varieties, and the 1st prize was awarded to Mr. F. Cant, the 2nd to Mr. B. R. Cant, the 3rd to the Rev. H. Foster-Melliar, of Sproughton. The last-named gentleman beat both these strong competitors in the next class for twelve Tea-scented and Noisette Roses, and the three prizes for six varieties only were

taken respectively by Mr. O. G. Orpen, of West Bergholt; Rev. H. A. Berners, and Mr. John Woods, Woodbridge. The National Rose Society's Silver Medal, for the best Rose in the open classes, was won by Mr. F. Cant, with a well-grown bloom of Victor Hugo.

Seven classes were reserved for amateurs, and in the first of these, for eighteen distinct varieties, the Rev. A. Foster-Melliard gained the 1st award from the Rev. H. A. Berners and Mr. J. Gurney Fowler, The Glebelands, Woodford, who were 2nd and 3rd respectively. The honours for twelves and sixes were about equally divided between the same gentlemen, with a 3rd prize going to Mr. Orpen; and in Mr. Gurney Fowler's dozen was found the Rose, for which was given another Silver Medal offered by the Rose Society. This was an absolutely perfect bloom, the best in the tent, of the variety Duchesse de Morney, of a delicate rose colour, with the reverse of the petals silvery. A Bronze Medal for the best H.P.'s grown by an amateur was awarded to Miss Penrice, Whitton House, Norwich, for specimens of Prince Arthur and Ferdinand de Lesseps.

Pot Plants.—Specimen stove or greenhouse plant, 1st, Major Howey. Orchids, four, 1st, Lord Rendlesham; 2nd, Mr. C. Whitfield King, Ipswich. Specimen Orchid, Lord Rendlesham. Exotic Ferns (tree Ferns excluded), 1st, Duke of Hamilton (gr., Mr. J. Best). Specimen Fern, Mr. J. E. Burness, Melton. Hardy Ferns, six, 1st, Mrs. T. W. Grimwood. Group of stove, greenhouse, or other plants, 1st, Mr. J. A. Burness; 3rd, Major Howey.

Among the fruit, Grapes and Strawberries made the best display, and from the prize list we cull the following:—Collection for dessert, eight varieties, 1st, Hon. W. Lowther, M.P. Peaches, 1st, Mr. A. E. Studd. Nectarines, 1st, Mr. A. E. Studd. Grapes, two black and two white, 1st, Mr. C. Whitfield King; three black, 1st, Miss Walford; ditto, white, 1st, Mr. J. A. Burness. Heaviest two bunches, Lady North. Melons, 1st, Mr. W. Whitmore, Wickham Market (gr., W. Spall). Best Westley Hall Melon, Mr. R. Burrell. Strawberries, eight varieties, 1st, Mr. F. Garrett; 2nd, Hon. W. Lowther, M.P. Strawberries, thirty-six, one variety, for weight, 1st, Mr. R. Steel, Woodbridge. Strawberries, thirty-six, one variety, for flavour, 1st, Mr. James Rose, Woodbridge. The Cottagers' exhibits were numerous and good.

BOSTON HORTICULTURAL.

JUNE 30.—This was the twentieth anniversary of a Society that caters for the people in a purely agricultural district, by providing an exhibition which, in addition to horticultural produce, includes also horses, dogs, poultry, and, indeed, domestic pets of all kinds; it is not, therefore, to be wondered at that the attendance was large.

Cut Roses are always a leading feature, but owing to the lateness of the season, they were sparingly produced. Messrs. G. & W. Burch, nurserymen, Peterborough, had the best twenty-four varieties, single blooms, staging fine fresh blooms in their usual excellent style; they were also 1st with twelve varieties. The best six Roses, the competition confined to amateurs, came from Dr. Clegg, of Boston.

The best stand of twelve varieties of stove and greenhouse cut flowers—a very good lot—came from Mr. Dolby, Boston; and he was also 1st with a stand of twelve varieties of hardy flowers. The collections in both these classes were highly creditable to the exhibitors; in the latter class, Mr. Nugold was a close 2nd. The best stand of wild flowers for table decoration came from Mr. T. Allen. It was charmingly arranged. Mr. T. Martin well deserved the 2nd prize. Baskets of wild flowers were very attractive, and some very fine fancy Pansies were shown in the class for collections of twelve blooms. Excellent double Pyrethrums in bunches of three blooms were shown by Messrs. Greenfield and Dolby, who were 1st and 2nd.

Specimen plants are not grown to a large size about Boston, but what were shown were in good condition. The best six came from Mr. G. Butler, gr. to T. C. Garfit, Esq., Boston; and Mr. T. B. Dolby, nurseryman, Boston, was 2nd. One specimen was an admirably grown example of the old *Trachelium caruleum*, not so much grown as it well deserves to be. Mr. J. Oldred had the best six Fuchsias, Mr. Dolby was 2nd; and the same exhibitors were also 1st and 2nd with tuberous-rooted Begonias. Mr. Dolby had the best six zonal Pelargoniums, and Mr. Nightscales, Sleaford, was 2nd. Mr. Dolby was 1st with six large-flowering Pelargoniums, well grown and bloomed. Mr. Dolby

was 1st in both classes for six Gloxinias and four Petunias; and Mr. T. B. Dolby, with three Lilies in pots, having *L. auratum*.

Foliaged Plants.—Mr. Butler had the best six specimens of Ferns; and Mr. J. Oldred was 2nd. The best *Coleus* came from Mr. Dolby, and the 2nd prize went to Mr. Nightscales. Lycopods were a capital feature; Mr. Oldred was 1st, and Mr. Butler was 2nd; unfortunately, an excellent piece of *Burseria aurea*, shown by the latter, was somewhat damaged, or he would have been placed 1st.

Fruit, owing to the season, was somewhat sparingly shown; and the prizes being small, do not attract leading growers.

Vegetables are remarkably well-grown about Boston, Mr. J. Jarnell had the best collection of six varieties, a very good lot indeed; and Mr. Dolby was 2nd; and in the classes for different sorts of vegetables there was a very good competition.

BIRMINGHAM BOTANICAL SOCIETY.

The annual meeting of the Birmingham Botanical and Horticultural Society was held on Tuesday, June 30, at the Botanical Gardens, Edgbaston. The Mayor (Alderman Clayton) presided.—The fifty-ninth annual report stated that the number of members last year was 922, as compared with 919 in 1889, 931 in 1888, and 1,065 in 1887. The committee regretted that the number of shareholders and subscribers shows practically no increase over that of 1889; a substantial increase in this number was still necessary before a repetition of a credit balance on the year's accounts could be confidently anticipated. The general accounts showed an excess of income over expenditure of £89s 2d.

The Mayor, in moving the adoption of the report, said that the number of admissions seemed to show that those beautiful gardens were appreciated not only by the members, but by the general public. The gardens were in excellent condition, and the new corridor was an addition on which he sincerely congratulated the committee. It had added greatly to the attractions of the place, by furnishing an entrance from the road to the conservatories that was dry in all weathers. The Rose show certainly was magnificent, and the fact that it resulted in a gain instead of a loss was another subject for congratulation. As to the Sunday question, he thought that the committee had rightly interpreted the general feeling of the subscribers against the proposal.

Mr. A. H. Griffiths seconded the motion, which was carried unanimously.

The officers and committee were re-elected, and votes of thanks having been passed to them and to subscribers and donors, the proceedings closed with a vote of thanks to the Mayor.

ROSE SHOW AT BURFORD LODGE.

By the kindness of Sir Trevor Lawrence, Bart., M.P., the annual show of the Brockham Rose Association was held in the grounds of Burford Lodge, on Wednesday, July 1, a fine band and various accessories conducive to enjoyment being thoughtfully provided by the host.

For twenty-four Roses of any kind, 1st, A. Tate, Esq., Downside, Leatherhead, who won the Gold Medal of the National Rose Society with splendid blooms of Madame Gabriel Luizet, A. K. Williams, Countess of Oxford, Duchess of Bedford, &c. C. E. Cuthell, Esq., of Box Hill, was a good 2nd, with good blooms of Ulrich Brunner, A. K. Williams, Marquise de Castellane. Lady Lawrence, Burford, Dorking, highly commended for a bright and fresh-looking collection.

Twelve Teas or Noisettes, single trusses.—Mr. Tate was again 1st with a very fine even lot of blooms; Rev. A. Cheales, Brockham, was a good 2nd; Mr. Cuthell, who was close behind, was highly commended.

Six any kind, triplets.—Mr. Tate was 1st, with some fine blooms; Rev. A. Cheales, 2nd. Mr. Cuthell and R. H. M. Praed, Esq., were the other exhibitors.

Twelve, any kind, single trusses.—Mrs. Perkins, Holmwood, was 1st, with very fine and even blooms, and was awarded the other Gold Medal of the N.R.S. E. Horne, Esq., Reigate, was 2nd, Hon. Dudley Ryder 3rd, amongst whose lot was chosen the Comtesse de Nadaillac as the finest Rose in the show. Other exhibitors in this class were R. H. M. Praed, Esq., Mickleham; F. T. Wollaston, Esq., Reigate; and Mrs. Leopold Seymour, Brockham.

Teas or Noisettes, single.—Mrs. Perkins, 1st; F. T. Wollaston, Esq., 2nd.

Four, any kind, triplets.—F. T. Wollaston, Esq., 1st; Mrs. Perkins, 2nd.

Six, any kind, single trusses.—Mrs. Hatch was 1st, with all splendid blooms. Miss Dorothy Nestfield and Mrs. Poland were placed equal 2nd, with some very fine blooms.

Four Teas or Noisettes, single trusses.—Mrs. Poland, 1st.

Six one kind, Teas or Noisettes (single).—E. Cutbell, Esq., with Marie Van Houtte, 1st; W. Thompson, with Souvenir d'un Ami, 2nd.

Six same kind, not Teas or Noisettes (single).—Mr. Tate 1st with Madame Gabriel Luizet, very fine; Mr. Cutbell, 2nd, with Charles Lefebvre.

Collections of not less than eighteen and nine, in bunches of three trusses.—Rev. A. Cheales for eighteen, and Mrs. Seymour for nine.

Dinner-table decoration, any flowers.—Miss Dorothy Nestfield, 1st; Mrs. Bonecke, Box Hill, 2nd; Miss Tate, highly commended.

Baskets of Roses, with Ferns and Foliage.—Miss Blake, 1st; Miss Tate, 2nd; Miss Cladys de Cetto, Miss Dorothy Nestfield, Miss Lawrence.

Button-holes.—Miss Dorothy Nestfield, 1st; Miss De Cetto, 2nd.

Messrs. Paul & Son, Old Nurseries, Cheshunt, showed the new Bourbon Rose, Mrs. Paul, and was much admired; and some good blooms of Bruce Findlay, John D. Pawle, Souvenir de S. A. Prince, Comtesse B. de Blacas, Viscountess Folkestone, Madame Renabury, Marchioness of Lorne, and the new hybrid Tea, Progress.

Mr. Appleby, Dorking, showed a box of good blooms H.P., a very fresh lot; and twenty-four Tea Roses, also very good. He also sent a very good seedling Rose, unnamed, bright red, very near to General Jacqueminot. Mr. Appleby also supplied the decorative plants for the show, including which were some finely-grown *Caladiums*.

CHERTSEY, WALTON, AND WEYBRIDGE.

JULY 2.—The best show yet held by these combined Societies was that which took place on July 2 in Ashley Park, Walton-on-Thames. The principal feature was the plants. For eight stove or greenhouse specimens, Mr. J. Reeves, gr. to Mrs. Vachell, Outlands Park, was an easy 1st; Mr. J. W. Reed, gr. to E. Pettit, Esq., Broadwater, Outlands Park, 2nd. *The Gardeners' Magazine* gave a Silver Medal in addition to the 1st prize in this class, for cultural skill.

For six flowering plants, Mr. J. W. Reed was the only exhibitor, but well deserved the award given him of first honours; and he was also 1st for specimen flowering plants.

Mr. Cook, gr. to J. S. Sassoon, Esq., Ashley Park, Walton, was the winner in the class for six foliage plants. Mr. Reeves staged the best exotic Ferns and *Caladiums*. Mr. Millican, gr. to H. Cubbett, Esq., Walton-on-Thames, the best hardy Ferns. Tuberos Begonias were superbly shown by Mr. W. Stedman, gr. to Miss Verity, Weybridge. Fuchsias equally so by Mr. Reed, while all other kinds of plants were represented in the best condition.

Ample provision was made for groups arranged for effect. Mr. Reeves arranged the best group, Mr. Reed followed close. In the smaller class, Mr. Millican secured leading prize with one which commended itself to all lovers of choice arrangement.

Roses made a good show, so numerous were they staged. For twenty-four varieties, single trusses, Mr. J. Sparrow, gr. to the Rev. A. Bramwell, Barrow Hill, Chertsey, led with an even lot of blooms, fresh, and of good colour. Mr. A. Hunt, gr. to W. L. Cohen, Esq., Englefield Green, Egham, 2nd. Ten competed in the class for twelve blooms in as many varieties. Mr. Reed had the premier stand, Mr. Sparrow 2nd. Stove and greenhouse cut flowers, herbaceous varieties as well as Geraniums, were well shown.

Fruit, though not large in numbers, was good in quality. For six dishes, Mr. T. Osman, gr. to L. J. Baker, Esq., Ottershaw Park, Chertsey, was premier winner with an even lot, as also was he for two bunches of black Grapes. Mr. Hunt took a similar position for white Grapes in two bunches, with a splendid Foster's Seedling. Mr. Reed followed with Muscat of Alexandria. Mr. Sparrow had the best Melons, both scarlet and green flesh.

Vegetables were a very good lot. Mr. Sparrow, 1st, for eight varieties, staging choice produce. Mr. Reed had the best Tomatos—Perfection. Non-competitive exhibits added considerably to the exhibition.

Groups of plants of a miscellaneous character were sent by Messrs. B. S. Williams & Son, Paradise Nurseries, London; Messrs. J. Laing & Son, Forest Hill; and Messrs. Reed & Sons, Norwood Nursery. Roses in large numbers came from Mr. J. Jackman, Woking.

CHISWICK HORTICULTURAL.

The eleventh summer show took place on the 2nd inst. in the Royal Horticultural Society's gardens, and may be regarded as a success in every way.

Much interest centred in the introduction of a new class in this year's schedule, viz., for a group of Gloxinias, arranged with Palms and Ferns, occupying a semi-circular space on grass, not exceeding 100 square feet. This class proved to be one of the great features of the show, constituting, as it did, a most effective and pretty display. There were four competitors, and the post of honour was worthily accorded to Mr. A. Meulon, gr. to J. B. Hilditch, Esq., Argyll House, Richmond, for a really beautiful arrangement, the Gloxinias comprising some grand, freely-flowered examples. He was very closely followed by Mr. Thomas Bones, gr. to J. Donaldson, Esq., Tower House, Chiswick, who had flowers of extremely fine quality, the following seedlings of his own raising being very conspicuous, Eclipse, Robusta, Miss A. Donaldson, and Mrs. S. A. Lee; 3rd, Mr. A. Wright, gr. to E. H. Watts, Esq., Devonhurst, Chiswick, a well arranged lot—highly commended.

Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick. This firm took 1st prize in the open class for a most effectively-arranged group of miscellaneous plants; whilst a similar distinction was bestowed upon Mr. A. Wright, for a beautiful arrangement in the gardeners' class.

Stove and greenhouse plants were also successfully shown by Mr. Wright, he having, amongst other good examples, a particularly well-flowered specimen of *Clerodendron Balfourianum*.

First honours were secured by Mr. C. J. Waite, gr. to Colonel W. P. Talbot, Gleohurst, Esher, for dinner-table plants. Gloxinias were shown in capital form by Mr. A. Jones, gr. to E. Hyde, Esq., Castle Bar Hill, Ealing.

Pelargoniums were well shown by Henry Little, Esq., Baronshalt, Twickenham; as also by Mr. J. Wiggins, manager to Mr. D. Baldwin, Hillingdon Heath, the latter collection being edged with some plants of a beautiful new golden tricolor, named Harbour Lights, a decided beat on Mr. H. Cox.

Cut Flowers.—The handsome Silver Challenge Cup, value 25 guineas, for seventy-two Roses, was won by Mr. B. R. Cant, St. John's Street Nursery, Colchester, with a superb lot of blooms; 2nd, Mr. Charles Turner, Slough; 3rd, Messrs. Paul & Son, Cheshunt.

Three Stands or Vases of Flowers and Foliage suitable for Dinner Table Decoration.—Mr. J. R. Chard, Stoke Newington, won the premier position with extremely beautiful exhibits.

In bouquets and other cut flower arrangements, Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Ealing; Miss L. Hudson, Gunnersbury, Miss Prewitt, Hammersmith, and Messrs. Perkins & Sons, Coventry, successfully competed.

Fruit.—Fruit was not abundant, but it was well shown by Mr. G. Clinging, gr. to W. Greenwell, Esq., Caterham Valley; Mr. T. Osman, gr. to L. J. Baker, Esq., Ottershaw Park, Chertsey; Mr. C. J. Waite, Mr. W. Ford, gr. to W. H. Ellis, Esq., Hounslow, Mr. E. Chadwick, and others.

Mr. W. Palmer, Surrey, staged a fine pair of Sutton's Triumph Melon, not for competition.

In *Vegetables*, Mr. C. J. Waite was, as usual, well to the front. He staged a really grand dish of the Duchess of Albany Peas, with pods nearly 6 inches in length. Mr. D. White, gr. to Mrs. F. Watson, Red-lee, Is'worth, also showed successfully in this department. The cottagers made a good display of flowers, fruit, and vegetables.

Miscellaneous.—Amongst these exhibits, not for competition, specially deserving of mention are:—A fine group of hardy ornamental plants and cut Roses, from Messrs. Lee & Son, Hammersmith; herbaceous plants and cut flowers, from Messrs. W. Cutbush & Son, Highgate; a most interesting group of Cacti, from Messrs. James Carter & Co.; and attractive groups of foliage and flowering plants, from Mr. M. T. May, gr. to the Marquis of Dute, Chiswick House, and from Mr. Reynolds, gr. to the Messrs. de Rothschild, Gunnersbury Park, Acton.

GLOUCESTER ROSE SHOW.

The fourth annual exhibition of the Gloucestershire Rose Society was held on Tuesday, 7th inst., in the Corn Exchange, and considering the recent wet weather, the quality of the blooms staged was better than anything that might have been expected. There were entries from all the principal Rose-growers in the country, and the thirty-two classes were well filled. In the nurserymen's division, the principal prize winners were B. R. Cant, Colchester; G. and W. H. Burch, Peterborough; Jeffries & Son, Cirencester; G. Prince, Oxford; and J. Mattock, Oxford.

In the open classes for amateurs, Dr. S. P. Budd, of Bath, took three 1sts and the Silver Medal of the National Rose Society for the best Tea or Noisette. The Rev. J. H. Pemberton, of Havering, Essex, took a 1st, a 2nd, and the Silver Medal for the best Hybrid Perpetual. Other winners were T. Hobbs, Bristol, 2nd and 3rd; and W. Drew, Ledbury, 1st.

In the classes for Gloucestershire amateurs, W. Conway Jones, T. Thorpe, and T. A. Washbourn, of Gloucester, and T. Hobbs, of Bristol, were most successful; Mr. Washbourn also securing the two Silver Medals for the best Roses in the section.

In the open classes, the 1st were taken by G. Prince, B. R. Cant, Dr. Budd, and Cranstons Limited, Hereford.

T. Burcher, of Barnwood, Gloucester, took the Silver Medal for the best Rose in the cottagers' division.

In the class for gentlemen's gardeners of the county, J. Sowray, gardener at Ighnam Court, Gloucester, was 1st.

For arrangement of Roses for table decorations, J. Mattock, of Oxford, was 1st in the open class; and W. M. Baker, Hasfield Court, Gloucester, 1st in the amateur's class.

ENFIELD HORTICULTURAL.

JULY 8.—This society was re-formed a few years ago, and this was the fourth exhibition, and it was held in the grounds of Chase Side House, a somewhat old-fashioned but admirably-kept place, rich in old Roses trained over archways, and other features.

Miscellaneous contributions proved very attractive. Messrs. R. and G. Cutburt, nurserymen, Southgate, staged a collection of plants of a highly creditable character, and Messrs. W. Cutbush & Son, nurserymen, Highgate, the same; while Mr. William Rumsey, nurserymen, Waltham Cross, had ten boxes of excellent cut Roses, and Messrs. Paul & Son, Cheshunt, a box of twelve blooms of their new Bourbon Rose Mrs. Paul, and some plants of a new Carnation of the Malmaison type, named Triomphe de Paris, bright carmine, very distinct in colour, to both of which Certificates of Merit were awarded.

Stove and Greenhouse Plants.—The best six came from Mr. May, gr. to H. J. Adams, Esq., Roseneath, Enfield, who had *Stephanotis floribunda*, *Allamanda Hendersonii*, *Ixora Williamsii*, and *Boegainvillea glabra*. Mr. E. Ayling, gr. to A. J. Hollington, Esq., Enfield, was 2nd, his chief specimen was a good one of *Clerodendron Balfourianum*. The best specimen plant in flower was a good piece of *Stephanotis floribunda* from Mr. H. J. Adams; Mr. Hopkins, gr. to H. C. B. Bowles, Esq., Enfield, was 2nd, with *Plumbago capensis*. The best specimen Orchid was a capital piece of *Cattleya Mendeli* from Mr. Ayling; Mr. H. J. Adams was 2nd, with a capital piece of *Cypripedium Lawrenceanum*.

One of the leading features of the show was the splendid specimens of *Achimenes*, perhaps as good as any to be found in the country. Mr. Ayling was 1st, and Mr. H. J. Adams 2nd, both with admirably grown and bloomed plants. Mr. J. T. Wall, Winchmore Hill, had the best six tuberous-rooted *Begonias*, well grown and bloomed; Cockscombs were very fine also. Mr. T. King, gr. to George Spicer, Esq., was 1st; and Mr. Ayling 2nd. *Fuchsias* and zonal *Pelargoniums*, shown in sixes and threes, greatly helped the display, and so did double *Petunias*, some capital plants being staged.

Groups of plants arranged for effect made a good feature along the sides of one of the tents. Mr. Ayling had the best group, including *Orchids*, *Cattleyas*, *Oncidium macranthum*, *Miltonia vexillaria*, and other things being remarkably good. Mr. H. J. Adams had the best group, from which *Orchids* were excluded.

Mr. Ayling had the best six foliaged plants—a very good lot; Mr. Hopkins was 2nd. Foliaged *Begonias*, *Coleus*, *Caladiums*, and *Lycopersium* were all shown in good form. The best specimen was

a fine piece of *Pandanus Veitchii*, from Mr. Hopkins. Mr. Ayling coming 2nd, with *Corypha australis*. The best six stove and greenhouse Ferns came from Mr. Ayling—a very good lot; Mr. Pulling, gr. to Mr. Twells, was 2nd. Plants for table decoration were numerous, and very good.

Cut flowers included Roses. Cut flowers in twelve bunches, Mr. Ayling taking the 1st prize, with some superb *Orchids*; Mr. H. J. Adams was a capital 2nd. Bunches of zonal *Pelargoniums*, double and single, and hardy herbaceous flowers, shown in collections of twelve bunches, were capital.

Fruit was limited in quantity, and included Grapes, Cherries, Peaches, Melons, &c. Some good Strawberries were shown.

Vegetables, in the open class, as well as those shown by amateurs and cottagers, were numerous; and there was a fair competition for the special prizes offered by Messrs. Sutton & Sons, James Carter & Co., and C. Sharpe & Co.

Among the special prizes offered, was one for the best short essay on the structural and other peculiarities of any plant, a living specimen of the subject selected to accompany the paper. That from Mr. May, gr. to H. J. Adams, Esq., received the 1st prize, the subject being *Sarracenia purpurea*, a short crisp essay accompanying it. Mr. Hopkins was awarded the 2nd prize, taking the Date Palm, *Phoenix dactylifera*, as his subject.

EDINBURGH BOTANICAL.

The last meeting of the session was held at the Royal Botanic Garden, on July 9, Mr. Lindsay, President, in the chair.

W. B. Boyd, Esq., of Faldonside, Melrose, sent a large quantity of cut flowers of alpine and herbaceous plants, including fine examples of *Cypripedium spectabile*, *Delphinium grandiflorum*, *Heuchera sanguinea* (dark var.), *Lithospermum granifolium*, *Paeonies*, *Irises*, &c.

G. Potts, Esq., Fettes Mount, Lasswade, exhibited the following:—*Saxifraga coryleoides* (dwarf variety found by him in Norway); large leaf of *Rodgersia podophylla*, &c. Amongst many plants in pots from the garden may be mentioned:—*Aquilegia pyrenaica*, *Aceras anthropophora*, *Campylopus G. F. Wilson*, *Loasa lateritia*, *Silene quadrifida*, *Sibthorpia europaea variegata*, *Veronica diosmifolia*, *Saxifraga mutata*, *Inula Hookerii*, *Chrysanthemum leucanthemum* (three distinct vars.), *Geum strictum*, &c. Mr. Alexander H. Gibson contributed a paper on the Phanerogamic Flora of St. Kilda, and exhibited specimens of 130 species he had collected during a stay of five weeks on the island. In some cases, e.g., Honey-suckle, only a single plant existed. The absence of fruit on some plants was noted and attributed to the absence of insects, viz., wasps, bees, and butterflies. Mr. Thomas Berwick, St. Andrews, gave a paper on the cotyledonary glands of *Rubiaceae*. In over thirty species, representing eight genera, he had found glands at the bases of the cotyledons before germination. The genera studied were—*Asperula*, *Borreria*, *Callipeltis*, *Crucianella*, *Galium*, *Thyllis*, *Spermacoce*, and *Vaillantia*.

Dr. John H. Wilson reported the occurrence of *Geum strictum*, Ait., from the woods at Blair-Adam, where it had become naturalised in abundance. Dr. Wilson also drew attention to a remarkable instance of prolongation of the flowering period of *Tritonia* (*Montbretia*) *Wilsoni*, Baker, flowers having continued to be borne on one inflorescence for seven and a half months.

REPORT ON TEMPERATURE, &c., ROYAL BOTANIC GARDEN. BY MR. LINDSAY.

During the month of June, the principal feature of the weather was its excessive dryness; and, as the absence of rain followed a long drought, lasting throughout the whole of the past spring, the marvel is that its effects have not been more serious on vegetation. A good fall of rain took place on the 26th, after which all danger from drought was at an end. Rain fell on seven days during the month. No frost occurred; the lowest night reading of the thermometer was 37° on the 10th, and the highest 56° on the 18th; the lowest day reading was 54° on the 1st, and the highest 81° on the 29th of the month. The foliage of all forest and ornamental trees is now complete, except several North American trees, such as Tulip tree, Liquidambar, Catalpa, and deciduous Cypress, which are still far behind. Conifers are developing fine clean growths, *Piceas* and *Abies* particularly so. The different species of *Pinus* are flowering most profusely this season. The golden-coloured varietal

of Yew are very bright, and extremely well-coloured. Herbaceous plants, though late in flowering, are still very fine. The early spring-flowering bulbs, &c., have ripened a fair supply of good seeds.

The rock garden was most attractive during June; 359 species and varieties of plants came into flower, besides a large proportion of those which commenced to flower in May, and continued to flower in June. A few of the more interesting plants were:—*Aciphylla squarrosa*, *Allium M'Leanii*, *Androsace foliosa*, *Anthyllis erinacea*, *Arum palæstinum*, *Campylobasis abietina*, *Cynoglossum nervosum*, *Cypripedium parviflorum*, *Dianthus "Michael Foster,"* *Eckianthus himalaicus*, *Erigeron aurantiacus*, *Edrianthus pumilius*, *E. serpyllifolius*, *Geranium anemonefolium*, *G. armenum*, *Haberlea robusta*, *Heuchera sanguinea*, *Iris Cengialti*, *Linum acuminatum*, *Meloniopsis aculeata*, *Mimulus Bernettii*, *Nardostachys Jatamansi*, *Olearia furfuracea*, *O. macrodonta*, *Orchis foliosa*, *O. maculata superba*, *Pentstemon humile*, *P. Menziesii*, *Polemonium flavum*, *Primula reticulata*, *Ramondia pyrenaica alba*, *Rhododendron ferrugineum album*, *Saponaria ocymoides Loderii*, *Saxifraga valdensis*, *Trifolium uniflorum*, *Verbascum olympicum*, *Veronica amplicaulis*, *V. Bidwellii*, *B. anomala*, *B. luifolia*, &c.

REPORT FOR JUNE, BY MR. BULLEN, BOTANIC GARDEN, GLASGOW.

This was an unusually dry month, but nothing like summer weather was experienced until the 9th, when the temperature began to increase. Although we had a considerable duration of sunshine, the mean temperature for the month was low, owing to the continued breezy north-east winds. June 9 is recorded here as being the first day of summer, but no really hot summer weather was experienced until the 19th. From that date to and including the 25th, the sun thermometer registered from 93° to 98°, and that in the shade from 70° to 76°. No rain worthy of mention fell until the 26th, when such plants as had not been forced into premature bloom grew away vigorously. The latter days of the month were cloudy, and mostly cold. Outdoor plants are a fortnight behind their usual blooming season.

AYLESBURY HORTICULTURAL.

JULY 9.—Aylesbury can fairly claim to have one of the oldest horticultural Societies in the kingdom, for it was established in 1822, and it is said to have held an annual exhibition ever since. The one for the present year was held in the Corn Exchange, and scarcely fell behind any preceding one in point of quality.

The members of the family of Rothschild, a number of whom reside within short distances of Aylesbury, offered special prizes. Mr. Leopold de Rothschild for best collection of twelve dishes of fruit: the only exhibitor was Mr. Robins, gr. to Colonel E. D. Lee, Hartwell House—who had a very good lot indeed—Grapes, Peaches, Nectarines, Strawberries, &c. Lord Rothschild, for three bunches of black Grapes: Mr. Shrimpton, gr. to Lady A. de Rothschild, 1st, and Mr. W. Deacon, gr. to H. R. Lambton, Esq., 2nd, both with Black Hamburgh; and also for three bunches of white, and here Mr. Deacon was 1st with superb Duke of Buccleuch, Mr. Robins being 2nd with the same.

Mr. Alfred de Rothschild's special prize for the best collection of plants, arranged for effect, brought a good competition; and so did his lordship's special prizes for the best collection of plants, fruit, and flowers arranged upon a table.

The President of the Society, the Hon. Walter Rothschild, gave prizes for six double zonal Pelargoniums, which was won by Mr. John Walker, nurseryman, Thame, with some admirable specimens; and with six single-flowered varieties, Mr. Walker was also 1st. Mr. Joan Mattock, nurseryman, Headington, Oxford, was 1st, with six tricolor zonal Pelargoniums, staging some large, well-grown, and finely-coloured specimens, Mrs. H. Cox and Dolly Varden being grandly grown and coloured. The President's prize for six stove and greenhouse plants was won by Mr. Blake, gr. to H. Cazenove, Esq., who had all foliated plants. In addition, Lord Rothschild and his son offered special prizes for the best collection of stove and greenhouse plants, Mr. J. Shrimpton taking the 1st, and Mr. Smith, gr. to Earl Temple, the 2nd prizes. Special prizes for various subjects were also given by Baron Ferdinand de Rothschild, M.P., Mr. H. Cazenove, and others. Achimenes in sixes were well shown by Mr. Gulliver, Aylesbury, and Mr. Robins; and Mr. Robins had the best six Gloxinias.

The special prizes for thirty-six varieties of Roses fell to Messrs. Mattock and Walker, who were severally 1st and 2nd. Mr. Walker also had the best collection of six bunches of florists' flowers.

Vegetables were a good feature, for the district is famous for its fine growth of these. Special prizes were offered by Messrs. Sutton & Sons, E. Webb & Sons, Daniels Bros., and James Carter & Co., all of which brought a good competition.

In the cottagers' department there was a large and generally good display of vegetables.

THE FRUITERERS' COMPANY.

THE Lord Mayor presided on Monday, 13th inst., at the Mansion House over a meeting in connection with the Fruiterers' Company, for considering what further steps should be taken "For the promotion of Fruit Culture in our homesteads and cottage gardens." There was a large attendance, among those on the platform being the Baroness Biddett-Countess, Mr. Chaplin, M.P., Lord Egerton of Tatton, Alderman Sir J. Whitehead (Master of the Fruiterers' Company), and Lady Whitehead, and Colonel Sir Nigel Kingscote.

Alderman Sir J. Whitehead read letters from the Duke of Norfolk, the Duke of Westminster, Lord Derby, Lord Stanhope, Lord Ravensworth, the Dean of Rochester, Sir Trevor Lawrence (President of the Royal Horticultural Society), Sir James Paget, Mr. Charles Howard, Mr. De Laune, Lord Brougham, and Lord Coventry, all of whom wrote regretting their inability to attend the meeting, and expressing warm sympathy with its object.

The Chairman stated that the meeting was the first fruit of the movement set on foot during the renowned mayoralty of his predecessor, Sir James Whitehead—the first fruit of his energy and determination that fruit-growing in England should receive that attention which it deserved.

Mr. Chaplin, in the course of his remarks in moving the first resolution, said: We live in times when one of the great interests of this country in particular—I refer to the agricultural interest—has of late years been most sorely tried. I hope, and I believe, that at all events we have passed through the worst, and that there are happier and brighter times in store for us in the future; but this time of trial through which we have passed, I am bound to say, will not have been altogether without some compensating results, if it should have had the effect—as I think it will have, and as, indeed, I think it has had—of sharply directing our attention to the agricultural system which we have pursued in this country for so many years, and to the possibility of developing and, perhaps, to some extent diverting it into new and other channels for the future. The great staple of our agricultural industry in this country in the past has been the production—to describe it very roughly—of bread and meat, but the producers of bread and meat during the last ten or fifteen years have fallen, more or less, on evil times. They have been subjected to a sharpness of foreign competition unknown in former years, and which to the men of that generation would have been entirely unexpected; and it behoves us to consider, with all the care we can, whether there are not other means by which this great industry may be supplemented in the future. I cannot help thinking that in more than one direction, and more particularly within the domain of what is known as *la petite culture*, there are very considerable openings in which we may find, not substitutes, for that is far from my mind at the present moment, but useful adjuncts to the agricultural system of this country. Take the subject of dairy farming, there is much that still remains to be accomplished. Last year we imported dairy produce to the value of no less than £18,500,000, or more than the whole of the value of our Wheat crop, which used to be the great staple of our industry; I believe it is no exaggeration to say, that by far the greater part of these imports might be produced perfectly well in our own country. We import into this country every year eggs to the value of no less than £3,400,000; surely, it would not be a very great thing if we were to make an effort in the future which should enable us to produce this £3,400,000 worth of eggs instead of importing them. Then I turn to that branch of industry in which all of you in this hall are specially interested; and here I own that I speak with somewhat less of confidence than I have spoken up to now, because I am reminded of how greatly the success of fruit cultivation in this country depends upon climate, and climate appears to be the one thing of all others

upon which it is impossible to depend in England. Still, there remains the fact that we do import very large quantities of fruit annually from abroad, and much of it comes from countries like Canada, where, at all events, their climate is no better than our own. The total value of our imports of fruit last year was no less than £4,319,000, and that showed an increase of nearly £500,000 upon the amount which was imported in the previous year; but a very considerable part of this increase was made up of fruits which are not produced, and which are not capable of production in this country. Our imports of fruit may be classed generally speaking, under four heads. We import of Apples £800,000, of Nuts £600,000, of Oranges and Lemons no less than £1,800,000, and then we import a further £1,800,000 worth of other fruits which are classed in the returns under the name of unenumerated fruits. Of these unenumerated fruits, probably one-fourth in value consists of fruits grown in England. The others are fruits which we could not produce in this country. Adding this one-fourth to the amount for Apples, I shall probably be within the mark in saying that we import foreign fruits to the value of £1,200,000 annually which we could produce, if we chose to produce them, in this country. It is very gratifying to find already that a considerable move has taken place throughout the country in this respect, for I see from the latest return which we possess at the Board of Agriculture that in the year 1890 as against the year 1889 there has been an increase of 2408 acres in the country which are devoted to orchards and the growing of Apples and Pears. Again, I find with respect to small fruits that in 1890, compared with 1889, we have an increase of 4301 acres devoted to the growth of small fruits. Strawberry farming, also, is undoubtedly on the increase, and is becoming rapidly one of the important industries of the country. A great deal has to be done in the matter of agricultural education. The development of agricultural education requires very considerable funds, and very large funds have been recently devoted to that purpose. They have, however, been given to the County Councils of the country, and not to the Board of Agriculture; and what I want to point out is this—that it is rather to the County Councils than to the Department over which I have the honour to preside, that we must look for that development of agricultural education in the future. I am informed, though I speak with great deference in the presence of experts like my friend on this subject, that the selection of soil is a matter of the greatest importance; that the selection of plants is even of more importance; and, as I have pointed out already, climate has a great deal to do with it. Then, I am told that, with respect to orchards and the cultivation of Apples and Pears, careful attention to pruning is a matter of the very first importance. There is another point to be considered, the ravages of insects, and upon that subject I do think that we have been successful in the Agricultural Department—I hope it is the case—of conveying during the last year or two, a great deal of information to the general public which was not always forthcoming before. Part of the movement, which it has been my pleasure to chronicle to you this afternoon—part of the increase in the orchards and in fruit growing in this country—has been due to the initiation of the Fruiterers' Company. As an adjunct to the agricultural interest, I cannot doubt that it will be most useful and beneficial. It will add something also, I hope and believe, not only to the pursuits, but also to the happiness and comfort of the homes of our cottagers and working-classes. In that direction I hope it will be pressed, and that every means will be adopted of bringing home to them the information that will be useful, and which will enable them to cultivate their small gardens and allotments. This is a question which is becoming every day more and more important, because in the last two or three years there has been an enormous increase, which I hope is progressing, in small allotments of land placed at the disposal of the labouring classes. As far as I am concerned, I wish this movement God speed. I hope it will go on and prosper, as I cannot doubt that it will do, under the auspices with which it has been begun; and I venture to say this—that among all the great, useful, and beneficent works which, without number, have from time to time been inaugurated under the chief magistrate of the greatest city of the world, there are few, if any, I believe, more entirely deserving of our support than that which we are met to promote this afternoon. I now propose the following resolution:—"That in the opinion of this

meeting, vigorous efforts should be made to restore the orchards and to promote the extension of hardy-fruit cultivation in our homesteads and cottage gardens, and that the Lord Mayor be invited to open a subscription list with the object of maintaining the necessary funds to enable the company to carry out their purpose."

Lord Egerton of Tatton seconded the motion. As an economical question, he regarded the subject as of importance in these days.

GARDENERS' ORPHAN FUND.

THE Rose Fair and Floral Fête, in aid of the Gardeners' Orphan Fund, which was held at the Crystal Palace on Wednesday last, instead of the show formerly held in the Flower Market was, we are pleased to learn, very satisfactory in all respects. The attendance was large, and the Floral display extensive, groups of plants and cut flowers &c., being arranged by many of the leading nurserymen, while Roses in profusion were offered for sale. A rectangular bank of many thousands of cut blooms surrounding a group of Palms, &c., was arranged in the centre transept, the flowers being the gift of the following growers:—Messrs. J. Carter & Co., Forest Hill; H. Cannell & Sons, Swanley; F. Cant, Colchester; H. B. May, Edmonon; Wm. Paul & Son, Waltham Cross; J. Cheal & Sons, Crawley; J. Laing & Sons, Forest Hill; W. Fromow & Sons, Chiswick; Dickson & Sons, Belfast; E. F. Such, Maidenhead; G. Prince, Oxford; W. B. Smale, Torquay; Maurice Young, Godalming; C. Turner, Slough; W. Rumsey, Waltham Cross; Dicksons, Limited, Chester; G. W. Piper & Sons, Maresfield; Keynes, Williams & Co., Salisbury; J. Peed & Sons, Norwood; J. Jellies & Sons, Cirencester; Messrs. J. Smith, Mentmore Gardens, Leighton Buzzard; W. H. Divers, Ketton Hall Garden, Stamford; Rose, Lockinge Park Gardens; Cummins, Carshalton, and G. Wythes, of Sion Gardens, Brentford, were also contributors in this section, and it must be a source of gratification to these gentlemen to know that their Roses found a ready sale in the evening, and that the Fund will benefit accordingly.

There were, moreover, other stalls and stands where plants, fruit, and flowers were on exhibition or sale. Mr. H. B. May sent an extensive collection of Ferns, which made a very pleasing relief to the colours of the Roses. Messrs. J. Peed & Sons had arranged an effectual collection of finely grown foliage plants; while Caladiums, &c., came from Mr. J. R. Box, of Croydon. Messrs. B. S. Williams & Sons, Holloway, sent a large lot of miscellaneous plants. A collection of Cacti and finely flowered Petunias from Messrs. Carter attracted notice.

Messrs. Barr & Sons sent a large lot of cut herbaceous flowers, as did also Messrs. J. Cheal & Sons, and Messrs. Veitch, of Chelsea, who also had fine show blooms of Roses. Mr. Chard, Stoke Newington, arranged effective table decorations, using his arches which were covered with Roses chiefly. Messrs. J. Laing & Sons had a brilliant display of Begonias, and from Messrs. Reid & Bornemann, Sydenham, came a stall of fruit and flowers for sale, some decorative arrangements of Roses being very fine; goods for sale were also sent by Mr. Williams, of Lewisham, while Strawberries were the gift of Messrs. H. Cannell & Sons, G. Bunyard & Co., and others.

The receipts for cut flowers amounted to about fifty pounds.

Among the special attractions of the day, one of the most popular was the cricket match—The Seedsmen v. Gardeners of England (playing fourteen on each side)—which resulted in a victory for the latter after some close play. The game was commenced at 10 o'clock by the Seedsmen, under Mr. C. H. Sharman; the gardeners being captained by Mr. E. Molyneux. The scores were as follows:—

Gardeners.

Battell, c. Sampson, b. E. Pollard, 11; Cripps, c. F. Pollard, b. Hurst, 2; Hathaway, l. b. w., b. Hurst, 3; Cawer, run out, 0; Do, b. Pugh, 14; Agate, l. b. w., b. Ellis, 2; Record, b. Pugh, 5; Rowbottom, c. H. Young, b. Sampson, 11; Floyd, c. Cannell, b. F. Pollard, 20; Allan, c. Sampson, b. F. Pollard, 28; Rose, c. Sampson, b. C. H. Sharman, 1; Fassum, not out, 9; Dines, b. F. Pollard, 0; Molyneux, b. F. Pollard, 11; extras, 13. Total 130.

Seedsmen.

1st Innings:—Pugh, D. (Carter & Co.), b. Agate, 0; Pollard, E. (F. Slocock), b. Agate, 17; Sampson, S. N. (Hurst & Son), b. Floyd, 16; Cannell, E. (Cannell & Son), c. Rowbottom, b. Agate, 10; Hurst, C. E. (of Burbidge), b. Agate, 3; Young, A. S. (Milford Nurseries), st. Rose, b. Agate, 19; Ainsworth, S. (Carter & Co.), b. Floyd, 0; Pollard, F. (Carter & Co.), b. Floyd, 15; Ellis (Cheal & Son), b. Agate, 1; Sharman, C. H., Jun. (Carter & Co.), b. Floyd, 1; Young, H. (Milford Nurseries), b. Floyd, 0; Parr (Cooper, Taber & Co., Limited), c. Agate, b. Floyd, 0; Pearson, C. (Carter & Co.), b. Floyd, 2; Sharman, C. H. (Carter & Co.), not out, 3. Extras 5; total, 92. In the second innings of the Seedsmen, D. Pugh scored 25, E. Pollard 12, while S. N. Sampson and E. Cannell were 23 and 5, respectively, not out. Extras, 3; total 68.

Obituary.

FRANK MILES.—We regret to have to record the death, on July 15, of Mr. Frank Miles. The deceased gentleman was a clever artist, who was best known to the horticultural world by his many pretty sketches and drawings of garden scenes and plants, &c. He had for some years suffered from a mental disorder, and died at an early age. His father, the Rector of Bingham, is celebrated for his collection of hardy perennial plants.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Rows list districts like 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 with corresponding weather data.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, Ac., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 11, is furnished from the Meteorological Office:—

"The weather was unsettled and showery during the early part of the week, with thunderstorms and heavy falls of rain in many places. Towards the close of the period, however, the weather improved considerably, and was mostly fair and dry.

"The temperature was a little below the mean in all districts, excepting 'Scotland, E.,' the deficit ranging from 1° in 'Scotland, N.' and 'England, N.E.,' to 3° in most other parts of the Kingdom. The highest readings were observed mostly on the 10th, but at some of the extreme western and northern stations they occurred earlier in the week. With the exception of 'England, N.E.' and 'England, S.,' there was no district in which the thermometer reached 75°, and in the majority of

'grazing' districts, with the addition of 'Scotland N.,' the readings were in all cases below 70°. The lowest readings were observed on varying dates, the thermometer falling below 45° in most parts of the country, and reaching a minimum of 40° in 'Scotland, E.' (at Ochtertyre).

"The rainfall amounted to a little more than the mean in most of the Wheat-producing districts, and to a little less than the normal in most of the 'grazing' districts. In 'England, N.W.,' however, there was a slight excess, while in 'England, N.E.' the average amount was just reached.

"The bright sunshine was very deficient, the percentage of the possible amount ranging from only 12 in 'Ireland, N.,' 13 in 'Scotland, N.,' and 18 in 'Ireland, S.,' to 35 in 'England, S.,' and 44 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, July 16.

OUT-DOOR fruit in fair supply, with trade dull and prices lower. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, 1/2 sieve, s.d. s.d.; Lemons, per case, s.d. s.d.; Melons, per dozen, s.d. s.d.; Peaches, per dozen, s.d. s.d.; etc.

NOTE.—Bananas and Apricots differ in price so greatly, according to quality and quantity on sale, that no trustworthy quotations can be afforded. Peas also vary in price every hour.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flower prices: Arum Lilies, 12 blms, s.d. s.d.; Orchids; Asters, French; Cattleya, 12 blms, s.d. s.d.; etc.

ORCHID-BLOOM in variety.

NEW POTATOES.—Home-grown supply fairly heavy. Price from 6s. to 9s. for Kidneys, and 4s. 6d. to 5s. 6d. for Beauties. JERSEYS, 6s. to 6s. 6d.; French, 4s. to 6s. OLD POTATOES.—Close this week, at 47; supply exhausted. NEW ZEALAND.—Consignment of 50 tons of Blues this week, although the condition is fair, the venture is a failure.—J. B. Thomas.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Artichokes, Globe, s.d. s.d.; Lettuces, per doz, s.d. s.d.; Mushrooms, punnet, s.d. s.d.; etc.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing potted plant prices: Aralia Sieboldi, per doz, s.d. s.d.; Foliage plants in variety, each, s.d. s.d.; etc.

NOTICES TO CORRESPONDENTS.

ACACIA: *C. T. & Co.* Probably an Acacia, but it is not possible to say which one.

CARNATION DISEASE: *Nemus, S. W. L.*, and other correspondents. Your plants are suffering from an attack of eel-worms. See fig. 11, and paragraph in p. 71.

CATTELEYS: *E. B.* Excellent samples, giving evidence of good cultivation.

COLEWORTS: *Miss F.* It is now too late to sow Cabbage seed for producing small open-hearted Cabbages—Coleworts—in late autumn and early winter. The proper time for your district would be early in May. You may sow seed of any good hardy variety between July 25 and August 10, and plant the seedlings, when large enough, at 15 inches apart, on well-manured land. Every alternate row and alternate plant in the rows left, should be drawn, not cut, for winter and spring use, and those that remain will form the principal crop of the summer season. The plants drawn early in the year would be what are generally understood by Coleworts. If the Rosette Colewort be chosen for sowing in May, and the plants put out at 1 foot apart, nice hard little Cabbages form in autumn and early winter.

FIG. 12.—CURRANT BUD MITE MAGNIFIED.

CUCUMBER: *G. S.* Your Cucumber roots are badly affected with eel-worms, often figured and described in these columns. Destroy the plants, turn out the soil, and start afresh.

CURRANT SHOOTS DYING: *Chas. Kershaw, Oakwood*, and others. The injury is caused by the Currant-bud mite, *Phytoptus ribis*. Cut off and burn all affected shoots, dress the soil with quick-lime or gas-lime, stirring the surface, and use such washes as are usually employed against red-spider (see fig. 12).

DISEASED VINES: *Francforto*. It is hardly possible to get out the fungus from the tomentum of the dried leaf, as the latter is so brittle, but from the spores seen, we believe it to be the American *Peronospora viticola*, a most destructive pest. All affected leaves should be burnt at once, and every precaution taken to slay the pest by spraying with Bordeaux Mixture.

DOUBLE-FLOWERED BEGONIA: *Austin, Glasgow*. A very beautiful and large rose-pink coloured blossom. A variety that is certainly worthy of being perpetuated.

FRUIT GROWING UNDER GLASS: *A. B. Handy Book of Fruit Culture under Glass*, by David Thomson (Blackwood & Sons). Price, probably, 5s.

FUNGUS: *A. J.* Next week. The larger Saxifrage appears to be Wallacei, the smaller a form of hypnoides, but the specimens are insufficient.

GRAPES: *J. D. B.* See our answer to "Peaches: Constant Reader." In any case, many of the Grapes will be spoiled, as you have allowed the mildew to develop so much before seeking advice.

Steps should be taken to arrest the spread of the pest on the very slightest appearance of it on leaf or berry.

INSECT: *Woolfey*. A weevil; most destructive. Trap them with slices of Carrot at night, and destroy them.

MELON LEAVES DISEASED: *J. F.* The plants are attacked by a species of mildew, probably *Sphaerotheca castagnei*. Apply flowers-of-sulphur in fine powder, by means of a *boite à houppes* or a sprayer. It was well to send full particulars of soil, management, &c.; but these moulds or mildews baffle the best modes of culture at times.

NAMES OF PLANTS: *R. W. H.* 1, *Polemonium ceruleum*; 2, *Sedum rupestre*; 3, *Dianthus Armeria*; 4, *Dianthus*, not known; 5, *Sedum spurium*; 6, Looks like *Blechnum boreale*, but very small.—*Geo. E.* 1, *Oxalis corniculata*; 2 and 3, species of *Oxalis*, which are not recognisable as sent. The plant that passes for Shamrock is *Trifolium repens* (white Clover), or sometimes *Oxalis acetosella*.—*G. B. Heythrop*. 1, *Galium verum*; 2, *Ajuga reptans*; 3, *Polygonum Persicaria*; 4, *Ononis arvensis*; 5, *Geum urbanum*.—*T. T. & S.* 1, *Agrostemma coronaria*; 2, *Hippophae rhamnoides*; 3, *Heuchera Richardsoni*; 4, *Rosa polyantha*.—*H. J. Ross*, *Orchis ustulata* (not a variety of *O. incarnata*), *Gymnadenia conopsea*, *Nigritella angustifolia*, *Nigritella suaveolens* (yes, a natural hybrid between the two latter).—*F. B.*, *Campanula*. You send a flower only, which we take to be a variety of *C. persicifolia*. The coloration of the calyx is not unusual in these plants.—*A. J. A. B.* *Begonia*, one of the hybrids from *metallica*.—*H. M. M.* 1, *Davallia canariensis*; 2, *Asplenium fragrans*; 3, *Lastrea filix-mas*; 4, *Athyrium filix-femina*; 5, *Blechnum occidentale*; 6, *Polypodium cambricum*.—*Bellis*. 1, *Fuchsia Riccartoni*; 2, *Campanula Trachelium*; 3, *Cistus* sp.; 4, *Thalictrum majus*; 5, *Spiraea palmata*; 6, *Veronica longifolia*, probably; 7, *Phalaris arundinacea variegata*; 8, *Agrostemma coronaria*.—*C. E.* 1, *Helianthemum* sp.; 2, *Lychnis chalconica*; 3, *Potentilla grandiflora*, garden form; 5, *Adiantum capillus veneris*; 6, *Polypodium plumosum*.—*J. H.* 1, *Aloe veruocosa*; 2, *Oenothera macrocarpa*; 3, *Davallia pyxidata*; 4, *Asplenium praemorsum*.

PANSY: *J. M.* A curiosity, interesting to botanists, but which would not find favour with the florists. The sepals of the calyx are unusually large and leaf-like, and the petals undulate.

PEACHES: *Constant Reader*. The fruits are badly mildewed. You must dress the trees with some of the recognised mildew remedies; but, we fear these will scarcely save the fruit this season. Use a little warmth in the pipes night and day, and avoid a close cool atmosphere. You might smear the pipes with sulphur in whitewash, and put pans of the same about the house.

RHODODENDRONS NOT OPENING THEIR BUDS: *C. Mansfield*. The results of the severe winter. It is very common this year.

ROSE GIBB: *W. M.* Next week.

STRAWBERRIES: *Crollmus*. The strongest runners should be layered in pots, all others being cut off. Lose no time in getting the job done.—*W. B.* Entirely smashed on arrival.

GARDENERS' FRIENDS.**

CAMPBELL'S FUMIGATING INSECTICIDE

Big Facts:—
Mr. WILLIAMS, Gardener to Earl Lisburne:—"I have given your New Fumigating Material a thorough trial. Nothing could be more simple to use, nor more effective in its work."

Big Facts:—
Mr. THOMSON, Gardener to the Duke of Buccleuch:—"One of the best inventions connected with horticulture that has been introduced for many a long day. I will never use Tobacco paper again."

Mr. CULVERWELL, Gardener to Sir F. Millbank, Bart.:—"The Fumigating Insecticide is very effectual. I have recommended it to several people."

Mr. GEO. WYTHES, Gardener to the Duke of Northumberland:—"Pleased with Insecticide; answered its purpose thoroughly; for Orchids a boon."

PRICES:—

For houses with a 1000 cubic feet, No. 3 Roll, 1/- each } Post capacity of 72000 " " " " 4 " " 19 " } Free. The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.

The Safest and Most Effective Liquid Insecticide for Dipping or Syringing.

Mr. FLACK, Gardener to the Marquis of Cholmondeley:—"Your Lemon Oil is most effectual and safe, destroying every insect it comes in contact with, as well as having such cleansing properties."

Mr. MILNE, Gardener to Lord Delamere:—"Your Lemon Oil Insecticide is the best, safest, and most effective I have ever used."

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half gallons, 5s. 9d.

A truly valuable remedy. Has saved thousands of Bulbs.

GLIBRAN'S EUCHARIS MITE KILLER.

Mr. B. CROMWELL, Cleveley Gardens, says:—"The result of using your EUCHARIS MITE KILLER is, that our stock of Eucharis is now furnished with dark-green leathery foliage, and pots full of strong fleshy roots."

PRICES, post-free:—Half-pints, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by

DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

THE STOTT

PATENT DISTRIBUTOR,
PATENT SPRAYER,
PATENT SYRINGE.
KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillar and all Insect Pests, and Prevention of Mildew.

Mr. J. FORSYTH, Gardener to the Right Hon. W. E. Gladstone, M.P., writes as follows:—

Hawarden Castle, The Gardens, Nov. 28, 1889.

Sir,—I have tried your Simplex Manure and Insecticide Distributor, and find them to answer very well, but especially the Insecticide Machine. I charged it with "Killmright," and found it very effective on insect life.

Extract from D. Deal, "Rose Notes," in the *Journal of Horticulture*, of June 18.

"If growers begin to complain of 'fly,' syringing must be resorted to. And here let me say that there can be nothing so effectual as Stott's Distributor and their powder, Killmright."

Retail from Ironmongers and Seedsmen; Wholesale and Retail from the Stott Distributor Co., Ltd., Barton House, Manchester.

THE CHEAPEST & BEST OF ALL. FIR-TREE OIL INSECTICIDE (soluble)

FOR PLANTS.—To make a solution for washing or cleansing purposes.—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Woolly Aphis, &c.—Half-a-Pint of the Fir-Tree Oil to two or four gallons of water, or two or three table-spoonfuls to the pint.

For Red Spider and Caterpillar.—Half-a-Pint of the Fir-Tree Oil to two gallons of water, or three table-spoonfuls to the pint.

For Mealy Bug, Brown or White Scale.—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight table-spoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage.—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six table-spoonfuls to the pint.

For Ants, Grubs, Worms, Wood Lice, &c., in the Soil.—Half-a-Pint of the Fir-Tree Oil to two gallons of water.

The most efficacious way to use Fir-Tree Oil in small quantities is to apply it with one of HUNTER'S AMERICAS.

When applied to the roots of delicate plants the soil should be drenched with clean water immediately afterwards, in all other cases washing is not necessary. Used with Warm Water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin, or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR NITS IN CHILDREN'S HAIR.—Mix one part of Fir-Tree Oil with three parts of Warm Water and apply with a Comb or Brush, the Hair can be washed shortly after.

FOR WASHING FLANNELS & UNDERCLOTHING.—Put a wine-glass full in ten gallons of water for steeping; the same may be put into the boiler. Common Soap may be used but no other preparations.

Sold in Bottles, half-pints, 1/6; pints, 2/6; quarts 4/6;

half-gallons 7/6; gallons 12/6 each.

Drums, 5 and 10 gallons each, at 11/ per gallon.

A Treatise on FIR TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the Manufacturer, addressed to E. CRIFFITHS HUGHES, Victoria-st., Manchester.

WHOLESALE from all the London Seed Merchants and Patent Medicine Houses.

NEW YORK—J. ROSE & SONS

THE "CLIMAX"

CONCENTRATED

WEED KILLER

Is Double the strength of any other.

Destroys all weeds on Garden Walks, &c., &c.
Improves the colour of the Gravel—has no smell.
Saves many times its cost in labour alone. One application will keep the walks clear of weeds for a whole season at least. Can be applied with an ordinary watering-can.

Note the strength, & compare the price with others.

1 Gallon makes 51 Gallons for use.

PRICE IN TINS:—1 gallon, 3s.; 5 gallons, 2s. 6d. per gallon; 10 gallons, 2s. 3d. per gallon; 40 gallon casks, 2s. per gallon. Tins and Casks free.

Carriage paid on all orders of 10 gallons and upwards. Sample gallons sent Carriage paid on receipt of Postal Order.

Prepared solely by the BOUNDARY CHEMICAL CO., Luton Street, Liverpool.

Can be had through all Seedsmen, or direct. Ask for the "CLIMAX," and take no other.

THE "CLIMAX"

MOSS ERADICATOR

Is Guaranteed to effectually Destroy all Moss on Lawns, &c. while at the same time it will stimulate and increase the Growth of the Grass.

THE "WORCESTER HERALD,"
 ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

SHOPMAN or WAREHOUSEMAN—Wanted, immediate engagement, in a good establishment, by a young man, age 19, having a general knowledge of the Seed Trade. Over ten years' experience. Good references. R. E., Messrs. Hogg & Wood, Seed Merchants, Coldstream, Scotland.

HOLLOWAY'S PILLS—Cure for Indigestion.—Indigestion, with torpidity of the liver, is the curse of thousands, who spend each day with accumulated sufferings, all of which may be avoided by taking Holloway's Pills according to their accompanying directions. They strengthen and invigorate every organ subservient to digestion. Their action is purifying, healing, and strengthening. They may be safely taken without interfering with ordinary pursuits, or requiring much restriction in diet. They quickly remove noise and giddiness in the head, and dispel low spirits and nervous fears. These balsamic Pills work the cure without debilitating or exhausting the system; on the contrary, they conserve and support the vital principle by substituting pure for impure blood.

BOUVARDIA PURITY (New White).—Undoubtedly the finest White Bouvardia yet obtained, and quite distinct from any other variety in commerce. The *Gardener's Chronicle* says:—"This may be regarded as the perfection of a White Bouvardia, and a perfect flower for florists' purposes." Certificate of Merit from Royal Horticultural Society, October 14, 1890. The above will be exhibited again at the next meeting of the Royal Horticultural Society. Price 5s. each, may be obtained through all the principal Nurserymen, or direct from the introducer.

H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton.

N.B.—Trade terms on application.

Rare and Valuable Orchids.

MR. RICHARD PFAU has entrusted me with the sale of the following rare and valuable ORCHIDS, collected by him in Costa Rica, all of which are now offered in perfectly established plants, viz.:

BARKERIA ELEGANS, nice plants, 5s. each.

ODONTOGLOSSUM KRAMERI.—According to Collector, this very distinct and beautiful species will always remain scarce, being very rare in its native country. Nice plants, of flowering size, 30s. each; fine strong plants, 105s. each. ODONTOGLOSSUM OERSTEDI MAJUS.—This very distinct and fine variety has larger flowers, and several flowers on each spike, much superior to type. Fine plants, 5s. and 7s. 6d. each, and 42s. per dozen.

TRICHOPIA COCCINEA ATROBUBENS.—The entire lip of a deep blood-red colour, very fine variety, 7s. 6d. and 10s. 6d. each.

TRICHOPIA TURIALYÆ, Rehb. f.—Very rare and most distinct species, with citron-yellow flowers; only one single plant found by Collector, 25s.

TRICHOCESTRUM PFAUI, Rehb. f.—A pretty winter flower; flowers of long duration. Small established plants, 7s. 6d. each.

The stock being very limited, early orders respectfully solicited.

Orders will be executed in strict rotation, and forwarded Post and package free to any part of Great Britain or Continent. Terms, payment within 30 days after receipt of plants, either by Post-office Order or crossed Cheque, made payable to EDWARD ORTIGIES, Inspector of Botanic Gardens, Zurich, Switzerland.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SEEDING OF THE BAMBOO.

THE harder species of Bamboo are becoming deservedly more popular year by year for the adornment of English pleasure-grounds. One thing, however, seems not unlikely to be lost sight of by many, viz., the fact that the culms of the Bamboo flower but once, the plant perishing immediately after the ripening of the seed. The usefulness of the many species of Bamboo now introduced into England in the embellishment of our gardens cannot be questioned, at the same time there is yet to be considered the eventuality of the flowering, seeding, and consequent death of the plants—which no art of the gardener can stay—after they have reached the climax of their grace and beauty. It would be, I imagine, almost impossible to determine the age at which these hardy Bamboos will produce flowers when grown in this country; most probably the term of years will differ with the various species.

With regard to the great Bamboo of tropical India, *Bambusa arundinacea*, it is a well ascertained fact, that the coming to maturity of this gigantic grass only occurs after a growth of some fifty years' duration; and as the phenomenon of its flowering, seeding, and subsequent death in India and other climes—where it covers with its huge and picturesque clumps many square miles of country—can have been seen but by few Englishmen of the present generation, some account of the extraordinary spectacle by an eye-witness may prove of some little interest to the readers of this journal.

It is unnecessary, of course, to give any lengthy description of the plant; suffice it to say, that in the locality in India where I had the rare fortune of witnessing the flowering and seeding of this gigantic member of the grass family on a large scale, the culms frequently attain a height of from 60 to 70 feet, and a diameter at their thickest part of from 8 to 10 inches. These culms are furnished with lateral branches, throughout their whole length adorned with a profusion of light green leaves. The plant is deciduous, shedding its leaves in India during the dry season, which are again renewed on the approach of the spring showers. The clumps present the appearance of colossal plumes of feathers, and when seen in full leaf are beautiful beyond description.

The soil of the tracts of country the Bamboo affects in South India is mostly of a shallow nature, with a gritty, ferruginous subsoil, and it is not found where the rainfall is excessive. When the clumps are in full vigour, the culms are produced of the above dimensions with amazing rapidity.

It was during the years 1863—64,⁷ while engaged in Coffee planting in the district of Wynaad, in the province of Malabar, that I witnessed the phenomenon of the seeding of *Bambusa arundinacea*. The plantation I had charge of at the time was situated in the midst of an extensive Bamboo jungle within but a short distance of the frontier of Mysore, and on the main road from the Malabar coast to Seringapatam and Bangalore. At the time of my arrival in the district, the magnificent Bamboo forest, interspersed with such deciduous hardwooded trees as Teak, Kino, Rose, and Sandal woods, and others of an equally valuable description, was, although unknown to me at the time, upon the eve of a sudden and wonderful transformation. Hundreds of square miles thickly covered with the exquisitely graceful clumps of the Bamboo, giving to the landscape as far as the eye could reach a beauty difficult to describe, were to be changed in the brief period of a little over a year by fire into a charred and blackened wilderness, the myriads of nodding plumes that for half a century had graced the woodlands were, at the call of Nature to blossom, yield their seed, and disappear from the face of the earth as by the breath of a destroying angel.

The south-west monsoon rains of 1863 had ceased about the middle of September, leaving the jungle tracts of Malabar in the very heyday of their glorious greenery, the Bamboo plumes waving to and fro by the gentle breezes still prevailing from the westward, glistening in the light of a tropical sun, and, as yet, showing no trace of the change they were so soon to undergo. As the season advanced, hot parching winds from the east began to take the place of the more kindly breezes from the west, and by Christmas, the leaves of the Bamboo thickly covered the ground. Simultaneously with the disappearance of the leaves from the laterals, the inflorescence began to appear, and the aspect of the country in every direction changed as if by magic. No one was prepared for such an eventuality, and the English planters in the district were struck with something akin to alarm when the fact dawned upon them that, in the course of a very brief period, not a living Bamboo would be left in the forest. A few there were who refused to believe that the culms would perish after ripening their seeds, and were only persuaded by the actual realisation of the fact. As nearly as I can remember, the seed was matured by the middle of May, the panicles of grain weighing down the culms to a third of their length, and giving them withal a graceful as well as fruitful appearance. When the seed, which was about the size and had much the appearance of small Oats, had fully matured, it fell to the ground in showers by every passing breeze, and then came a happy season for both man and bird. Sea-fowl, spur-fowl, partridge, jungle-fowl, and quail, with which the jungles abounded, revelled in, and got fat upon, the plentiful supply of good food so suddenly bestowed upon them by the hand of Nature, and man himself was not slow to take advantage of the offering. The coolies from Mysore employed on the Coffee plantations could with difficulty be induced to remain steadily at work during this Bamboo harvest, and the jungle tribes could not be persuaded to work at all, but subsisted solely on the fallen grain of the Bamboo, so long as any could be gathered from the ground. This seed they appeared to highly value, and, judging from appearances, it seemed to be very nutritious. The grain was ground into meal by the aid of small hand-mills, and two modes were employed in its cooking—the one by

baking in the form of cakes, and the other in boiling it into a kind of thick porridge. I myself ate the cakes on several occasions, and found them fairly palatable. These jungle tribes, although perfectly aware of the value of the vast granary thus laid at their feet, were, notwithstanding, improvident to a degree. They ate abundantly of the fruit whilst it lay on the ground, but made no provision against the approaching destruction of the whole by jungle fires. So, after these had licked the ground, they had, perforce, to return to work on the Coffee plantations. At the height of the dry season, and when the earth was thickly covered with a coating of Bamboo leaves and seed, these fires began to do their work, and, apparently, so completely that it was hard to believe that a single Bamboo seed could have escaped destruction, and that in the course of a decade or so, another such magnificent Bamboo forest could be produced; but Nature, in some mysterious way, was equal to the occasion, and before I left India in 1877, the Bamboo zone of Malabar and Mysore was clothed with another jungle, consisting of clumps approaching in size and grandeur those that perished in 1863.

From the date of the seeding of the Bamboo, the clumps stood throughout the following monsoon leafless and dead, but intact; and it was not till nearly a year after that their complete destruction by fire began. When the dead and sapless clumps caught light, the whole country was filled with flame and smoke for weeks together; loud reports were heard night and day without intermission, resulting from the pent-up gases within the hollow culms, and the whole Bamboo zone so picturesque and beautiful but a twelvemonth before was quickly reduced to a scene of desolation. The total destruction of the clumps, however, was not accomplished in one season, many escaping the fires till the second, and some till the third.

The young seedlings soon began to appear, but made but slow progress for several years. As time went on, the annual growth of culms waxed stouter and stouter, till at last a thick undergrowth of low Bamboo tufts covered the ground, which, in the fullness of time began to send up gigantic canes, till the forest was restored to its former strength and beauty.

With reference to the period of time required for the maturation of *Bambusa arundinacea*, I was at some little trouble, while in India, to ascertain from the native tribes inhabiting the jungles of the district the approximate duration of its existence, and was told by several men, apparently about sixty years of age, living widely apart, that they remembered a similar phenomenon of the seeding of the whole of the Bamboos of the district when they were boys. From this I concluded that about fifty years was the limit to the life of this giant species of *Bambusa*.

About three months before the flowering of the Bamboo, I had occasion to clear some 30 or 40 acres of land for the purpose of Coffee planting, the culms of the Bamboo being cut close to the ground. I waited patiently, curious to know the result of such an operation. When the monsoon rains began, the huge stools left in the ground began at once to send up numerous small culms of from 8 to 10 feet in height, and furnished with laterals. On the cessation of the rains these immediately flowered and seeded, after which the old stools perished absolutely, so that the act of cutting down the original culms had only the effect of delaying, not frustrating, Nature in her efforts at reproduction. *J. Lourie.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM INSIGNE.*

THIS is a native of Nepal, so it was surprising to me to obtain from a native collector a large quantity of a species closely resembling it from so far south as Siam. It is very distinct as a variety, both in form and colouring. The leaves are shorter and more crowded; the scape shorter, the flower rather smaller than that of the typical form. The general colouring is similar to that of the Nepal plant, but the white margin of the standard is broader, and runs right down to the base; the purple spots are crowded into the middle of the bright apple-green centre. The petals and lip resemble much those of the Indian forms, but the lip is more yellow. The shield is different in shape: instead of being cordate, with a notch in the apex, it is almost ovate, with, at the most, a depression at the top.

It is decidedly a charming plant, of very neat habit, and appears to be very floriferous. It will, I think, be welcomed by the lovers of *Cypripedia*. A considerable quantity was brought into Singapore, and a number of plants have ere this found their way to England. *H. Ridley, Singapore.*

A NEW HYBRID LILY, LILIUM MARTAGON × HANSONI.

Hybrid Lilies are so rare, that to get a new one is a matter of much interest. The only clear and undoubted instance known at present is *Lilium testaceum*, the Nankeen Lily, which is evidently a cross between *candidum* and *chalcedonicum*. I believe that some of the forms of the *bulbiferum* series (specially *umbellatum* and *fulgens*), will prove to be garden crosses, and very likely some of the forms between *speciosum* and *auratum*. The plant I am writing about at present has been raised by Mr. C. G. van Tubergen, of Haarlem, by fertilising *Lilium Martagon album* with the pollen of *L. Hansonii*. The cross was made in 1886, and the plants have just flowered for the first time. The flower is so manifestly intermediate between the two dissimilar original types, that I cannot doubt that a real cross has been effected. Mr. van Tubergen has only a small stock of plants at present, but is multiplying them for distribution. The following description is made from his notes and the specimens of the leaf and flower he has kindly forwarded:—

Bulb like that of *L. Hansonii*, white, not yellow, like that of *L. Martagon*, globose, 2 inches in diameter. Stem 4 feet high, dark green, smooth. Leaves in whorls, two or four according to the strength of the plant, eight or twelve leaves in a whorl, oblong, acute, thin, bright green, 5 or 6 inches long. Flowers at present 5 to 8 on a plant; pedicels very cernuous. Perianth-segments spreading from the base, oblong, acute, 1½ inch long, ¾ inch broad at the middle, dull yellow in the lower half, with copious small brown spots, passing in the upper half into unspotted claret-brown, flushed a little with dull yellow, dull claret-brown on the outside. Stamens equally recurved, an inch long; filaments yellow; anthers linear, brownish, ½ inch long. Ovary cylindrical, green, ½ inch long; style curved, green,

* *Cypripedium insigne* var. *exul.*, Ridley nov. var.—Herba caespitosa, folia linearia atroviridibus rigida pauca, 5—6; 9 pollicem longa, pollicem lata vel paulo minor, carina distincta, apice minute biloba, mucronulata. Scaapus brevis circiter 6—8 uncias longus, purpureus pubescens vel viridis, pubescentia purpurea. Bractea 2 uncias longa, lanceolata viridis glabra. Ovarium triquetrum rostratum pubescens. Sepalum posticum dorso pubescens oblongum ovatum 1½ pollicem longum, ferme 1 pollicem latum; basi et centro late viridi maculis purpureis margine et apice late albo. Sepala lateralibus connata herbaceo viridia dorso pubescente oblonga ovata cymbiformia. Petala 1½ pollicem lata, 1½ uncia longa, lorata subrotunda flavo-virentia linea mediana brunneo-cente ad basin, maculis paucis purpureis margine ciliato. Labelium 1½ pollicem longum, flavescens venosum marginibus involutis extus politum, intus pubescens, pubescentia purpurea. Columna ½ pollicis longa, subtus pubescens; clypeus ovatus politus ad basin pubescens, imbrone medio ocreo paulo elevato, subtus carinatus omnino pubescens. Capsula purpurea pubescens rostrata, rostro curvulo 1½ uncias longa.—Siam, Tonka.

as long as the ovary. The claret-red of the flower is like that of *L. Martagon* var. *dalmaticum*. *J. G. Baker, Herbarium, Kew.*

FRANÇOIS LEGUAT AND HIS PLANTS.

(Continued from p. 644, Vol. ix.)

CONTINUING the Abbé Pingré's observations on the flora of Rodriguez, as illustrating and commenting on Leguat's former description, his hitherto unpublished notes proceed as follow:—

Its cabbage is also said to be very delicate, but they take care of this useful tree, lest the extraction of its wine should weaken it, and lest the extirpation of the cabbage might cause its death. It is permissible to reckon the species of Palms, of which I have made mention previously, among the number of fruit trees. It is not altogether the same with the *Vacoua*. François Leguat, not knowing its name, gave it that of *Pavillon** or *Pavilion* tree. I have not observed either young Palm trees or *Latanias* sprouting, but I have seen plenty of young *Vacoua* (*Pandanus*) plants springing from the ground, which leads me to believe that this Palm-like plant, the most useless of all, is at the same time the most prolific. Meantime, I confess that amongst all the Palm-allies the *Vacoua* merits the prize for beauty. It is not entirely useless; its thick canopy of branches has often sheltered me from the heat of the sun, and from the violence of the rain. The *Vacoua*, when young, might be taken for a species of *Aloe*; its leaves are then 3 or 4 feet high, or, I should say, long, and are armed with sharp points, whose pricks I have several times experienced when trying to get through the obstacle which these young plants put in my way. The tree then shows neither trunk, branches, nor roots. One and all of these appear by degrees as the tree grows higher. When the tree is formed, at about 1½ foot from the ground; the trunk, descending from it, is divided into some twenty smaller trunks, which form a regular cone, reaching the ground, and there is divided, probably, into many other stems. At 10, 12, or 15 feet from the ground according to the size and age of the tree, the trunk divides still into many more trees and branches, which subdivide into yet smaller ones, and all this with a symmetry so constant as always to form a hemisphere whose convexity is turned towards the sky. The extremity of each small branch bears a sort of tuft of leaves; these tufts again resemble those of the *Aloe*, but less than when the plant was still young. The leaves are smaller, and the blunted points have not the same force. In the middle of each tuft sprouts a sort of cluster (*grappe*), which contains the fruit of the tree; it resembles somewhat that of the *Pine-apple*; the grains which compose it are extremely close. On opening it, one is struck by an odour which is precisely that of a very ripe *Quince*, but the taste is not the same. The fruit of the *Vacoua* is acrid, and absolutely worth nothing.

Besides these trees, which can be regarded as fruit trees, excepting the *Vacoua*, the Isle of Rodriguez also produces an infinity of others of different species. The following are the principal ones:—*Bois d'Olive*,† has nothing in common with our *Olive* trees, it only bears a fruit which has something of the shape of our *Olives*, but nothing of its uses, nor indeed in size even, for it is very much smaller. The *Bois d'Olive* grows very high, and forms a fine tree—it is good for carpentry; the planking of our boat, of which I shall speak presently, was made of this wood. The trunk generally resembles a number of trunks bound together under the same bark; but

on sawing the timber, it is perceived that it is really but one trunk, not cylindrical. The leaves of this tree present a singular phenomenon: when the tree is young, its leaves are very long and very narrow; as it grows up its leaves become short and broad. The difference was so striking, that I have hardly been able to persuade myself that these young trees and the old ones were of the same species. I at last met with one of these trees which had just put forth a branch or new shoot (*branche gourmande*). The leaves of the shoot were 4, 5, or even 6 inches long, and six lines or more in breadth; those of the old branches were 2 or 3 inches long, their breadth was from eighteen lines to 2 inches. The leaf of the old *Bois d'Olive* is not unlike that of the *Bay Cherry* (*Laurier-cerise*) not so long perhaps, less thick, and not so rounded at the point.

I have also seen a very singular *Bois d'Olive*. It might be said that its trunk was 30 feet thick, in one sense. The fact is, that these trees have their roots at the level of the ground, and that from these roots sometimes spring young *Olive* trees, in the same way that young suckers spring from the trunk of our European trees; thus, where three of these trees have so interlaced their roots, the horizontal trunk of these roots appears one, or the trunk of the primitive tree, when springing from the ground, is obliged by some strange cause to extend itself horizontally along a distance of 30 feet, and produces at last three branches, which grow as three distinct trees. Be that as it may, if one can imagine a trunk of a tree, 30 feet long, lying horizontally, from beneath having an infinity of roots, and above three trees lifting themselves perpendicularly from the two extremities, and from the middle of the prostrate trunk, one will have an idea of the tree, or of these three trees, of which I speak, for I leave to others to decide if this tree should be regarded as one or as three.

The *Benjoin*,* according to M. l'Abbé de la Caille (*Journal Historique*, p. 227), is a fine tree, which has no relation with the *Benjoin* of the Indies; it is thus called in place of "*Bien-joint*," because it is the most pliant wood of the country—it never breaks; it is excellent for wheelwrights. I am strongly inclined to think the same. Nevertheless M. Preodet, officer of the Company's troops, who is studying the botany of Bourbon, and who appears to do so with taste and intelligence, is persuaded that the *Benjoin* of Bourbon is the veritable *Benjoin*, although of a species different to the *Benjoin* of the Moluccas. The *Benjoin* of Rodriguez, which is certainly the same as that of Bourbon, exudes a gum which has no relation with that of the *Benjoin* of India.

The *Ebony* † is not rare at Rodriguez, I have only seen the black, I do not doubt that there is also the white and the veined. The young *Ebonies* have only soft sap-wood; the *Ebony* which is the heart of the tree, does not appear until several years have elapsed.

The *Bois Puant* ‡ is a fine full-sized timber tree; its wood is handsome, firm, well veined, excellent for carpentry, and for the construction of ships; it has one inconvenience, to which it owes its name; when newly cut it gives forth a foul odour, to which it is difficult to accustom oneself.

The *Corallodendrum* § is thus called because its wood nearly resembles branches of coral, by the sort of articulations from which the branches spring. It has this peculiarity, that it loses its leaves in a country where the other trees are always green. When I have seen it, on August 10, it had not any

leaves; it was laden with flowers and fruit. This tree is nearly the size of a large *Apple* tree, although with less spread of branches; the branches are bristling with thorns. The flower is produced in a cluster or bouquet, like the *Lilac*, excepting that the clusters are not divided into small bunches, all the blossoms springing direct from the same stalk. Each stalk bears from 100 to even 200 blossoms; the flower is about 2 inches long by 8 or 10 lines broad. It is of the genus of the *Pea-blossom*, the *Balsams*, the *Gucule-de-loup*; its colour is a fine flame-coloured red; its pistil is surrounded with ten stamens. The blossoms are in such great numbers, and so compact, that they crowd one another. Those nearest the branches were old and faded, the next were in full bloom; the last, at the extremity of the bunch, were awaiting apparently their turn to open. I could not find a single one whose fruit was ripe; without doubt the last ones alone become so. The fruit is enclosed within a pod which, besides the exterior membrane, is composed of three other rather tough membranes. This fruit is something like our *Beans*, it is more round, and of a rather deep red colour. The *Corallodendron* is easily multiplied by cuttings. The *Pignon d'Inde* * equally sheds its leaves when it is about to blossom. This tree is rather small. The tallest which I have seen at Rodriguez does not attain more than 9 feet, including its branches. The blossom of the *Pignon d'Inde* is small; it is sustained like the *Rose*, on five leaves, round, and disposed in the form of a star. It is composed of five petals of light yellow, verging on green; within it there are six small leaves, which I have recognised by a magnifying glass to be the stamens of the flower. I have searched in vain for a pistil, until having dissected one of the flowers, I discovered that the foot of the petals is surrounded by five small globules of a very bright orange colour, and of rather soft consistence. I looked upon these globules as taking the place of the pistil. (In that I was deceived; according to M. Adanson, the flowers are some male and others female, and these last are situated below the first.) The fruit of the *Pignon d'Inde* is enclosed in a capsule of an ellipsoidal figure. All the capsules which I have opened were divided into three cells; each cell had its seed of a similar ellipsoidal form, covered with a dark grey skin, but with a white flesh, and of an agreeable taste; but it is necessary to beware of it. This fruit purges violently; it is composed of two lobes, separated by a skin or white membrane, which one might easily mistake for a flower. This pellicule appears to be the germ, and it is in this germ alone, they say, that the purgative quality of this nut belongs. By removing this skin, the nut can be eaten without risk. I went up to a tree, which I regarded as living, notwithstanding its colour, which appeared different to that of the other trees; when beneath the tree, I thought it was dead. This tree is the *Gayac*; its leaves from beneath are absolutely the colour of dead leaves; above they are green. The *Gayac* † forms a very lofty and fine tree. I have seen other trees which have several trunks from their branches; they throw down to the ground their fibres or filaments; these fibres having reached the ground, there take root, and form new trunks of which the branches multiply in the same way, so that one alone of these trees can at last form a forest. One of the officers who was with me at Rodriguez, gave to this tree the name of *Bauge*. ‡ François Leguat confounds it with the *Paretuvier* or *Paletuvier*, of Rochefort, to which he gives also the name of *Mangle*, or *Manglier*—*Mangrove*. I believe that it is one of the species of *Indian Figs* or *Malabar Figs*, of which *John Ray* gives a description in the 2d vol. of his *History of Plants*, Liv. 27, Chap. III., p. 1436. I have remarked also a *Creepier*, or *Liane* (*Liane* § is a name generical to express

* *Terminalia Benzoin*, commonly called "*Bois Charron*" (*Balf.*, 340). The Abbé de la Caille visited Mauritius in 1733, and Bourbon in 1751.

† *Diospyros diversifolia*. Professor Balfour says:—"One seldom meets with a large tree. In all the large oes I met with, the dark heart-wood was quite decayed, leaving a shell of newer wood outside. I was told by inhabitants that this rotting of the centre always takes place in this species after it attain a certain height." (*l. c.*, p. 355.)

‡ *Bois Puant*.—*Fœtidia mauritiana*, or *Clerodendron lanciatum*—perhaps, more probably, the latter, now named *Foix Cabri*.

§ *Corallodendron*.—*Erythria indica*? *Schotia* sp.?

* *Pignon d'Inde*, or *Physio-nut*—*Jatropha curcas*.

† *Gayac*? *Dombeya ferruginea* or *Bois pipe*?

‡ *Bauge*. *Ficus* sp.

§ *Liane sans fin*. *Cassytha filiformis*, or *Liane calé* = *Sarcostemma viminalis*.

* See *Gardeners' Chronicle*, April 25, 1891, vol. ix., No. 234, p. 520.

† *Bois d'Olive* = *Elæodendron orientale*. Pingré's observations are confirmed by Professor Balfour, who states that the leaves are heteromorphic. "The young ones are linear and acute; . . . from this we trace a succession of forms to the most mature, which are obovate . . ." (*Philos. Trans., Botany of Rodriguez*, p. 334)

every plant which binds itself to another—like the Vine, Pea, Nasturtium, &c.), which grows generally in some holes or cracks of the trunks of trees, and thence sends down filaments which having touched the earth, becoming trunks, envelop with their branches and sometimes entirely cover the trunk of the tree where this Creeper was produced. *S. P. Oliver.*

(To be continued.)

BERLIN BOTANIC GARDEN.

WE referred at p. 368, vol. ix., to the great transformations in the Berlin Botanic Garden on the basis of plant distribution, and we now propose reproducing the principal facts concerning the plantations, illustrating the vegetation of various parts of Europe, as given by Dr. Pax in the *Gartenflora*. He begins by saying that probably no other garden possesses plantations exemplifying the flora of Europe to the extent and exactitude that the Berlin garden does. Emerging from the eastern North American plantation, one enters the mixed forest of the plains, much as it is developed in central Germany. Tall-stemmed Elms, Oaks, and Horn-beams, interspersed with black Poplars, wild Pear and Apple trees, and common Maple, form a sheltering roof, under the shade of which flourish such plants as *Convallaria majalis*, *Circea lutetiana*, *Stachys sylvatica*, *Scrophularia nodosa*, *Paris quadrifolia*, *Campanula latifolia*, *Melica nutans*, and *Epipactis latifolia*; whilst in the more open spots *Anemone*, *Corydalis*, *Galanthus nivalis*, *Lathyrus vernus*, *Myosotis sylvatica*, *Viola sylvatica*, *Listera ovata*, and many other pretty spring flowers carpet the ground. The border of this mixed forest consists of shrubby Elms and Maples, *Prunus padus*, *P. spinosa*, *Salix cinerea*, *Viburnum opulus*, *Roses* and *Rhamnus*, with a few scattered herbaceous plants.

In striking contrast to the mixed forest is the contiguous Beech wood, consisting entirely of Beech trees, with an undergrowth of *Daphne Mezereum*, *Ribes rubrum*, *R. nigrum*, *Euonymus verrucosus*, and *Lonicera xylosteum*; and amongst the herbaceous plants almost constantly found in Beech woods planted here are *Tridentaria europæa*, *Vicia dumetorum*, *V. cassubica*, *Vinca minor*, *Asperula odorata*, *Hepatica triloba*, *Ranunculus lanuginosus*, *Rubus saxatilis*, *Astrantia major*, *Lilium Martagon*, *Carex digitata*, *C. montana*, *Thalictrum aquilegifolium*, *Corydalis cava*, *Lamium Galeobdolon*, *Milium effusum*, *Asarum europæum*, *Hypericum montanum*, *Phegopteris*, *Dryopteris*, and *Euphorbia dulcis*.

The Pine and Birch woods to the right of the Beech wood stand out conspicuously on account of their greater uniformity of composition. Few herbaceous plants grow under either Pines or Birches. Characteristic among plants that flourish under the former are: *Viola arenaria*, *Potentilla rubens*, *Scorzonera humilis*, *Anthericum ramosum*, *Gypsophila fastigiata*, *Dianthus cæsius*, *Astragalus arenarius*, and *Luzula pilosa*. The Pine forest passes gradually into the open heath, where Pines and Birches, and Juniper bushes are scattered singly over the Heather the herbaceous element, including patches of glaucous grasses, such as *Festuca*, *Aira*, and *Molinia*, interspersed with *Anemone Pulsatilla*, *Arnoseris minima*, *Helichrysum arenarium*, *Antennaria dioica*, *Jasione montana*, *Dianthus deltoides*, and the *Artemisia campestris*.

A small area close by is utilised to exhibit the characteristic features of the vegetation of a boggy moor, with such woody inhabitants as *Pinus uliginosa*, *Betula nana*, *Oxycoccus*, *Vaccinium*, *Andromeda*, and *Ledum*; and *Rhynchospora alba*, *Sedum villosum*, *Viola palustris*, *Lysimachia thyrsiflora*, *Drosera*, *Pedicularis*, and *Potentilla palustris*, are among the herbaceous plants.

Passing from the geographical formations described—from the mixed forest, the Beech forest, the Pine and Birch forest, the heath, and the moor, by a narrow and winding walk, which several times crosses an artificial brook, we ascend to the moun-

tain plantations. These are on a large scale, rising from 5 to 6 yards above the general level of the garden, and covering a considerable area. Thus, the part representing the alpine flora is nearly 45 yards long, and consists of three chains; the central one of granite, and the lateral ones of chalk. This rock garden, with steep declivities and variously coloured rocks, sheltering in their fissures the characteristic flowers, is a great attraction to visitors.

Before reaching the alpine quarter, the path leading from the plain leads through moist meadows, and then the vegetation of the lower hills, which gradually passes into that of the higher hills. First of all one crosses a meadow of the lower hills with its characteristic representatives, *Trollius*, *Geranium sylvaticum*, *Myrrhis odorata*, *Valeriana dioica*, *Cirsium rivulare*, *C. heterophyllum*, *Crepis præmorsa*, *Hieracium pratense*, *Colchicum*, *Orchis*, *Gymnadenia conopsea*, *Polygonum Bistorta*, *Senecio crispatus*, and *Veratrum*; and in drier places, *Arnica*, *Centaurea*, *Phrygia*, *Arabis Halleri*, *Primula elatior*, and many other species. The forest of the lower hills consists of Silver Fir, Spruce Fir, and Beech. The characteristic shrubs, which form part of the underwood in the tall forests, comprises *Lonicera nigra*, *Ribes Grossularia*, and others; whilst *Staphylea pinnata*, *Euonymus verrucosus*, *Pyrus terminalis*, *P. aucuparia*, *Acer pseudo-platanus*, *Sambucus racemosa* prefer, or are exclusively confined to the Beech forests. Characteristic herbaceous plants include *Saxifraga decipiens*, *Lamium maculatum*, *L. galeobdolon* var. *montanum*, *Dentaria bulbifera*, *Digitalis ambigua*, *D. purpurea*, *Calamagrostis arundinacea*, *Luzula angustifolia*, *Carex pendula*, *C. digitata*, &c. Here, too, is evident the greater richness of the Beech forest as against the coniferous forest, the former sheltering such plants as *Cypripedium calceolus*, *Thalictrum aquilegifolium*, *Aconitum variegatum*, *Salvia glutinosa*, *Euphorbia amygdaloides*, *E. dulcis*, *Asperula odorata*, and *Blechnum*, which are not found in the latter. Above the forests of the lower hills succeeds a shrubby of sub-alpine Willows (*Salix cæsia*, *S. arbuscula*, and others), and *Rhododendron hirsutum*, mostly near the streamlet. Here and there bushes of *Rosa alpina* appear, and in the shelter of the shrubs, or along the stream, grow *Aconitum Napellus*, *Rumex alpinus*, *R. arifolius*, *Epilobium trigonum*, *Saxifraga rotundifolia*, *Hieracium flavescens*, *Senecio crispatus*, *Streptopus*, *Mulgedium alpinum*; and among smaller plants, *Viola biflora*, species of *Androsace*, and many others. Clumps of the dwarf *Pinus montana* are likewise characteristic of this region.

At the foot of the alpine chain, and above the shrubby vegetation of the subalpine zone, are alpine meadows, in the short grass of which appear the beautiful flowers of various species of *Pedicularis*, *Gentiana*, *Viola lutea*, *Pulsatilla alpina*, *Geum montanum*, *Bartsia*, *Euphrasia Salisburgensis*, *Meum mutellina*, and *Polygonum viviparum*.

The real alpine flora of the European Alps is arranged on three parallel ranges of rocks, whereof the central granitic range represents the Central Alps and its peculiar flora, and the range, rising from the alpine meadows, consisting of chalk, contains the flora of the Northern Alps; whilst the range on the other side of the Central Alps, formed of limestone, supports the vegetation of the Southern Alps.

It would occupy too much of our space to enter into full particulars of the plants of these three ranges; but the differences in the floras of the granitic and limestone mountains are specially interesting. There are further subdivisions, too, illustrating the peculiarities of the vegetation of more restricted districts.

The principal other mountain chains of Europe are reproduced in relation to the Alps as near as possible in accordance with their actual positions. At one end are the Pyrenees, and at the other, abutting on the eastern Alps, are the Balkan and Carpathian mountains; beyond which rises the mountains of Asia, beginning with the Bithynian Olympus, succeeded by the West and East Caucasus,

the Pontic and Armenian Mountains, the Lebanon and Taurus.

The question now arises, how far such a scheme of illustrating the geographical distribution of plants can be successfully carried out in so small an area as the Berlin Botanic Garden, of which, of course, the geographical plantations only occupy a portion, though a tolerably large portion. Our own idea is, that accurate as the scientific arrangement may be, and attractive as the grouping may be, in the early years of its existence, while the trees are still small, it would be impossible for them to become grown-up forests, or fully developed pictures of the vegetation of the various regions. Therefore the aim at instruction fails to a very great extent, and the plants and their labels are not so accessible to the public as they would be in mixed plantations and beds. Even in grounds so extensive as Kew Gardens, we should be sorry to see any strictly geographical arrangement adopted, because we think the necessarily artificial aspect of it would destroy the charm of the place. As it is, there are many beautiful and adequately representative groups of plants at Kew; and although the rock garden is doubtless susceptible of improvement, it is admirably adapted for a large number of persons being able to see a large number of plants without discomfort. In the Berlin plantations, we understand that the paths are, many of them, so narrow that the public is shut out from them altogether, and the plants are so far off that their beauties are not easily perceptible, and the labels so distant as to be illegible. *H.*

THE APIARY.

EXTRACTING HONEY.

As soon as frames in hives arranged for extracting are full of honey and capped, they should be taken out, passed through the extractor and returned to the bees to be refilled. A greater yield is the result. It is important to wait till sealing has taken place, as honey extracted from uncapped combs is thin and not properly ripened. It also has not the full aroma, and is liable to fermentation. Some amount of preparation is required before commencing extracting, and it should be done some distance from the apiary, preferably in an outhouse or other building containing a window, so that any bees brought in on the combs can escape, and at the same time robbers be prevented from gaining an entrance. It is necessary to have two uncapping knives, so that one can be getting hot while the other is being used. A lamp with boiler attached in which to place the knives, is sold for this purpose, but it is easy to improvise something of the kind that will answer the purpose almost equally well. The knives should be very sharp, and a cloth must be in readiness to wipe them on when taken out of the water. It is also advisable to wear an apron to protect the clothes, as honey is as bad, or worse, than grease to get rid of. A tray or large dish is required to stand the frame on whilst uncapping, and it is almost as well to make a wooden tray for the purpose, on which two pieces of wood can be tacked to form the shape of the letter L, against which the lug of the frame can be held, and so prevented from slipping. As the cappings are taken off, they should be put at once into a strainer, as a lot of honey drains from them. Whilst cutting, the frame should be inclined towards the hand holding the knife, and it is possible after a little practice to slice off nearly all the cappings on one side at one operation, if the surface is fairly even. When the extracting is finished, the honey must be strained, and the best thing for the purpose is a properly constructed honey-strainer and ripener. If this is not on hand, the next best thing is to tie a piece of coarse flannel over the mouth of a large earthenware vessel, into which slowly run the honey from the extractor. When the latter has emptied itself, it should be cleaned and the cage taken out, and the strained honey put back, and it is well to let it remain for some days before commencing to bottle it. *Expert.*

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1891.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

. Fuller details will be given in the following number. See also Leading Article on page 104.

FORESTRY.

PLANTATIONS recently formed on Heather ground and elsewhere should be examined at this season, and all weeds, grass, and surface scrub that are found to be smothering the plants should be cut over at the surface of the ground, to allow the plants space to branch out and form the nucleus of valuable timber trees. As this work proceeds, any rival leaders that appear at the top should be cut back, pointed, or removed altogether close to the stem with a sharp pruning-knife, care being taken to leave a smooth sloping surface to prevent the lodgment of water. Rambling side branches should be cut back, in order to form a uniform well-balanced top, and in doing so the piece to be removed should be cut off at the base of a lateral twig.

Young hedges should be weeded, and the surface of the ground broken up with the hoe and rake, to admit air and promote root action. After a growth of some two or three years, pruning becomes necessary, and may now be commenced, in order to gradually form the hedge into the desired shape. The best shape is that of wedge—broad at the base, and gradually tapering to a thin point at the top. When hedges are formed in this way, the whole surface of the plants from base to top is exposed to the influence of the atmosphere, which has a beneficial effect in promoting the healthy development of the plants, and preventing blanks. Young ornamental plantations should be dressed with the hoe and rake, to kill weeds and subdue undergrowth, and on no account should noxious weeds be allowed to ripen their seeds.

In the nursery department, seed-beds should be carefully hand-weeded, and in cases where the surface has formed a hard crust, it had better be broken up with a sharp-pointed peg, to admit air and promote the growth of the plants. Hoe and rake between the rows of forest and ornamental trees and shrubs, to promote root-action, and accelerate the growth of the plants. Some hardy species of weeds are apt to mature their seeds when lying on the ground, so that they had better be collected at once, and consigned to the rot-heap for manure. The berries of Mountain Ash, Hawthorn, Holly, and such-like, that were formerly stowed away in sand-pits to rot, should be turned, in order to promote the uniform decomposition of the mud. Spring-grafted trees and shrubs should be examined, and all superfluous growths of whatever kind should be removed. Loosen, nutie, and sort the grafts in such a way as to promote the growth of the scion, and as the circumstances of the case may suggest.

Examine bridges and bridle-paths in the deer forest and grouse moors, and have them put in a thorough state of repair where necessary before the 12th of next month. Mountain-paths are apt to be torn up and damaged by floods after the breaking up of a snow-storm. In order to counteract this state of things, I have found it a good plan to sow the seeds of some of the hardy deep-rooting grasses, as their roots bind the loose material, and in a great measure prevent the stuff from being washed away by rain, and thus afford firmer and better footing for hill ponies and pedestrians. *J. B. Webster.*

GRAPES CRACKING AND SCALDING.

THERE are varieties of Grapes which seldom, if ever, crack or scald, while others are peculiarly liable to these evils, Lady Downe's, perhaps, suffering the worst from scalding, and Madresfield Court from cracking of the skin of the berry; indeed, so much so, in some places, that gardeners have partially or entirely given up its cultivation; which is to be regretted, as without question it is one of the finest Grapes, and deserves every care and attention. Not only are the berries large and of good appearance when fully grown, but the flavour is rich and piquant, and is only excelled by that of the Muscat of Alexandria.

One, and the primary, reason for the splitting of the berries of Madresfield Court, is the thinness of the skin; and the next, any check to their swelling through dryness of soil and heavy waterings, or the soaking of the border by heavy rain, after which the expansion through the increased and rapid flow of sap is so great that the skin of the berries gives way at once.

We find just the same sort of thing takes place with Cherries and Gooseberries when a long drought is followed by heavy rain. In this case the skin of the fruit has, through the first cause, lost in elasticity, which seems to be greater among some kinds of fruit than others. To prevent the cracking of

of air betimes in the morning, and then putting on too much at once, which the sensitive skin of the fruits feel, and evils naturally follow.

When Grapes are ripening, be they of what variety they may, but more particularly the black varieties, I like to have the roof-ventilators slightly open by night, and just sufficient heat in the pipes to keep up the temperature to a point above 65°, as then there is no condensation of moisture on the berries in the morning, and colour is sure to be good if the Vines are in health. Scalding is brought about as much by lowness of temperature during the night and early morning as from heat, as the berries become quite cold, and it is the sudden transition from the one to the other that affects them, although many think the scalding is caused by the sun. If this were so, it stands to reason that only those berries would be affected that are exposed; but when scalding takes place, it will generally be found that bunches which are shaded by ample foliage suffer just as badly as any others, and this proves that it is not so much the direct action of the sun as its effects in quickly raising the heat and generating steam, or causing moisture to arise and condense on the berries, when the mischief ensues.

It will be seen, then, that the remedy against blister is on all fours with, or similar to that to prevent cracking, so far as airing and firing are concerned, as before daybreak there should be a genial warmth in the house, and no sudden rush of heat brought about by the sun bursting forth. Watchful and careful ventilating will prevent this, as by having gentle fires when the weather is adverse and cold, sluggish vapours are expelled, and a buoyant healthy atmosphere is kept up, under which favourable conditions Grapes will not crack, mould, or scald, but finish off with that beautiful bloom so pleasing to the eye of a gardener. *J. Sheppard.*

FIG. 13.—CALLICARPA PURPUREA: BERRIES SHINING LILAC. (S. L. 1891.)

the Madresfield Court Grape, various expedients have been adopted, some of these being the notching or part severance of the fruiting shoots, and in opposition to this allowing the laterals to run wild, and act in some degree as a safety-valve to use up suddenly-acquired sap. Both may answer very well under certain conditions, but the better course to adopt, if the roots of the Vines are outside, is to protect the border from heavy rain after the Grapes have reached their full size, and have put on some colour, up to which stage free waterings should be given, if the weather is at all dry; and if the roots are inside, they are then under control. Another cause of the splitting of Grapes is, sudden transitions from heat to cold, or *vice versa*, and the not giving

TREES AND SHRUBS.

MENZIESIA.

THIS interesting genus of small flowering shrubs is found in different parts of North America, Asia, Europe, Scotland, and Ireland. The following kinds are all perfectly hardy, and although they are generally spoken of and treated as peat-soil shrubs, yet they are by no means confined to that class of soil, and with a little care they may be grown with success on any ordinary texture of soil, providing it is thoroughly drained and well broken-up previous to planting. The Empetrum-like *Menziesia* (*M. empetriformis*) is indigenous to North America, and was introduced into this country about the year 1810. Some botanists refer it to the genus *Phyllodoce*. Although a foreigner, this species has proved to be thoroughly hardy, and capable of flourishing on a great variety of soils and situations. This present season it was actually loaded with its pretty bell-shaped pink flowers at the middle of May, and continued in splendid order for some considerable time, and although the plant is growing in clay loam, yet as regards health and appearance it is all that can be desired. The contour of the plants is something like the native Crowberry (*Empetrum nigrum*), hence its name. As it only attains a height of some six or eight inches, and forms a round-headed little bush, it is well adapted for rockery planting where space is but of limited extent. It is by no means a bad town's plant, and amateurs might introduce it in many cases into their small gardens with advantage. It is generally well-clothed with small linear-shaped leaves, of a glossy green colour, and as each shower of rain washes the dust and sooty particles from their hard surface it is thereby kept in a clean thriving condition.

The Scottish *Menziesia* (*M. cœrulea*), also named by some botanists *Phyllodoce taxifolia*, is likewise found in different parts of North America, as well as in the north of Europe and in Scotland; it is also found to a limited extent in some parts of Perthshire. It forms quite a dwarf evergreen-bush, some 5 or 6 inches high, and when well established is fur-

nished with abundance of small wiry stems, branches, and twigs, which are well clothed with small linear-shaped leaves of a glossy-green colour, and toothed around the margins. It generally produces its pretty purplish bell-shaped flowers about the end of June and beginning of July. It is a capital rockery-plant, and amateurs should use it as such in their small gardens.

St. Dabeoc's Irish Heath (*M. polifolia*), called by some botanists *Dabeocia polifolia*, is another dwarf evergreen shrub, indigenous to some of the mountainous districts in the west of Ireland; but I have never seen it in the north, nor on the Wicklow mountains on the east side of that county. When well established, it forms a neat bushy specimen plant, from 10 to 12 inches high, well clothed with ovate-shaped glossy green leaves, the under side of which is of a downy texture. It generally produces its pretty reddish-coloured flowers in July, and when these are fully expanded, it forms a remarkably attractive specimen, and well worthy of a place in the rock garden, where it can be seen to advantage from the walks and drives in woodland scenery. There are several very attractive varieties of this species in cultivation, all of which are well worthy of the attention of the amateur, and all of which may be had at a cheap rate from any respectable nurseryman. When planting these shrubs in ordinary soil, mix a little leaf-mould with the staple at the spots where they are to be inserted. This will give them a good start, and prove highly beneficial. *J. B. Webster.*

CULTURAL NOTES.

ABUTILONS FOR WINTER FLOWERING.

Few plants are more easily grown than these, and when they have received a special preparation, few are more useful for producing flowers during the four dullest months of the year. Almost any soil will grow them, provided the pots are well drained; the best compost is a good strong turfy loam, with a little thoroughly-decayed manure and sharp sand. During the last ten or twelve years, these have been greatly improved, and are now well worth a little extra attention during summer, so as to produce a large quantity of flowers for winter work. By growing the plants out-of-doors, from June until September, giving them all the sun possible, and treating them similar to *Chrysanthemums*, *Abutilons* will mature their growths, and have a fine show of flower-buds at the point of each shoot; these will continue to open through winter and early spring.

It is best to knock them out of their pots about the end of April or May, and to cut them back rather hard, repotting them into good soil, and growing on in the open air as recommended. *Sparmannia africana*, when treated in the same manner, will also make an excellent plant for winter greenhouse flowering; in fact, neither of these plants is used so much as it deserves, if only for this grand quality of producing such quantities of flower, and at such a useful period. Large plants of either may be grown in tubs, and when introduced into a warm temperature will supply an immense amount of bloom.

Among *Abutilons* we can have many distinct colours, such as white, red, orange, yellow, rose, and several intermediate shades. The flowers last some considerable time in a cut state, particularly if water is not allowed to touch the pollen-bearing portion of the bloom; this causes it to run into a sweet and sticky mass, which soon ruins the flower.

Planted against a wall or pillar, they will resemble all over it, and with a little attention to tying or tacking in, will soon clothe it with foliage and bloom. At any time when the plants are not flowering freely enough, or you have an extra demand for cut flowers, if you give them a little extra heat, the plants will very soon respond by giving a greater profusion of flowers. Weak manure-water, especially soot-water, helps them very much, and also keeps the foliage of a good colour. *Abutilons* enjoy

an abundance of water, and provided they are well drained, it is scarcely possible to give them too much while in full bloom and growth. *A. P.*

ORCHID NOTES AND GLEANINGS.

THE WOODHATCH ORCHIDS.

MR. HAYWOOD does not aim at a great collection of species and varieties in his Orchids, but prefers to grow large quantities of those that are more amenable to easy culture as well as beautiful. For instance, lately there were as many as 300 spikes of *Odontoglossum crispum* in flower, and a prettier floral feast could hardly be imagined. At present, since July and August are about the worst months for the crispums, he has large numbers massed together of *O. vexillarium* and *Harryanum*. The form *radiatum* of the former is very striking, and and some of the *Harryanums* have broader white bases in the labellums, and greater depth of colouring in the petals than I ever remember to have noticed before. The collection of *Cypripediums* contains nearly all the old favourites, and *C. Veitchii* and *C. bellatulum* are grown in quantity. The drooping petals of *C. Stonei* reminded me much of a spaniel's ears. An old Orchid, not much seen now-a-days, is *Tricopilia tortilis*, which is very noticeable on account of its one coriaceous leaf and cork-screw sepals. Any one who may chance to call at Woodhatch just now should by no means leave until he has looked into the stove, the roof of which is simply dazzling in its many-coloured splendour. Close together, growing luxuriantly, are *Dipladenia Brearleyana*, *Gloriosa superba*, and *Allamanda Hendersoni*. The velvet-pink of the first, the vivid scarlet of the second, and the burnished gold of the third, coalesce to form a cynosure from which the eye lingeringly turns. A curious trait of the *Gloriosa* is that the style spreads horizontally from the apex of the ovary. The *Nepenthes* in this same house are loaded with pitchers, those of *Hookeri* being very large in size. The secret of their pitching in such quantity seems to be the fact of their being hung near to the glass, on which there is very little shading. They are essentially sun-loving plants. *C. A. M. Carmichael.*

THE ROCK GARDEN.

ROMNEYA COULTERI.

It is interesting to see this rare Californian Poppywort flowering so freely as it is at the present time so far north as the York Nurseries. The plant is most distinct, forming, as it does, large semi-shrubby bushes from 2 to more feet in height. The blossoms are large (4 inches or more in diameter), pure white, and continue fresh for many days in deep, rich sandy loam, under the shelter of a wall, where the root can readily be covered in winter with a little litter. There is another very singular and beautiful Poppywort flowering on the rockwork in the above nurseries—the blue Himalayan Poppy *Meconopsis Wallichii*. It has an erect stem over 4 feet high, with large pendent light-blue flowers, 3 to 3½ inches in diameter. *R. P.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

THE INTERMEDIATE-HOUSE.—The most beautiful flowering plant here at the present time is *Sobralia xantholeuca*, and it is a fine grower, of good habit, and dwarfer than most of the species. The large yellow blossoms which follow in succession, number as many as five on strong growths, each flower lasts two days in perfection. I grow the plant in a mixture of loam, peat, and sphagnum moss, and very small crocks. When growing strongly, liquid manure made from guano and soot, seems to benefit the plants.

Cœlogyne cristata and its varieties may now receive guano-water at each alternate watering, and the syringing of the plants morning and evening can scarcely be overdone whilst they are growing. *Barkerias* must also be well syringed three or four times a day, otherwise thrips will be likely to make their appearance, and few plants suffer more from them than *Barkerias*. *Lycaste Skinneri* and its varieties will now be growing away, and any plant with roots growing on the outside of the pots will be the better if assisted with weak guano-water at first, gradually increasing its strength as the plants gain in size. *Cypripedium insigne* will now be the better if placed in a frame facing the south, the glass having a shading over it during the sunny part of the day, and the plants kept very moist at the root, liquid manure being afforded twice a week.

Oncidium sarcodes is now breaking away into growth. This is not always a satisfactory plant, as it has the objectionable habit of flowering well, and then resting for a year before breaking into growth; this is not always the case, but it does so occasionally when in the best of health. The same thing I have noticed in *Odontoglossum hastilabium* and *O. Reichenheimii*, and I have noticed that these plants seem the better for the long rest taken.

The pretty *Leptotes* do exceedingly well when planted in baskets, and hung up near the glass in this house; they do not require a large amount of compost about their roots, which entwine themselves around the baskets; but it is a plant which requires a large amount of water, and frequent dipping of the baskets into a bucket of water.

Maxillaria venusta is a good Orchid for flowering at this dull season of the year, and the petals and sepals being pure white, greatly enhances its value at a season when white Orchids are scarce.

MASDEVALLIA-HOUSE.—We have now *Odontoglossum coronarium* sending up flower-spikes. These plants have been grown in this house for more than four years, and made extraordinary large growths. I have been told by many persons that I should not be able to flower them unless I dried them off severely, but as I had already flowered *O. chirmensis*, and *O. brevifolium* under the same conditions, I could not think it was necessary to dry the plant, and I had previously flowered it without doing so; it is, therefore, all the more satisfactory to see the plants are in bloom. In this house I find *Cattleya* or *Laelia crispata*, finds a congenial home. I tried for some years to grow this plant with other *Cattleyas*, but with little success, and it chanced that a plant of little value was crowded into this house, where it grew healthy and bloomed. The temperatures may remain as given in a previous Calendar, but a liberal amount of air must be afforded. *A. G. Catt, Parkfield, Hallow, Worcester.*

FRUITS UNDER GLASS.

TOMATOS.—These fruits will now be plentiful, if strong plants were placed in frames or pits as soon as these were cleared of Strawberries and vegetables. As soon as a good set is obtained, manurial aids may be given, the laterals and superabundant foliage being reduced. As manures for the Tomato, when in pots or boxes, I find "Le Fruitier" and "Thomson's Vine Manure" excellent, soon producing a wonderful change on exhausted plants. Tomatos planted out may be top-dressed, and, if root-space be small, a mulch of rotten dung may be put on the roots. With a little attention in stopping and feeding, abundance of fruit may be got for months in succession. The present is a good time to sow seed or strike cuttings for the latest lot; but I prefer seed, and rely on cutting raised plants for the early fruiterers at the beginning of the year, employing *Ham Green Favourite*, *Prelude*, and *Conference*. The Old Red is good for present sowing, it being the best late autumn and winter fruiter; and, to save time, a few seeds may be sown in large 60-pots, and when up, thinned to one strong seedling, removing them to a cold frame as soon as the third leaf appears, and grow them as sturdy as possible, re-potting them as occasion requires, finally shifting them into 9-inch pots. Grown quite cool from the first, they fruit very freely when placed in their fruiting quarters in the autumn. They may also be planted out.

MELONS.—Those which have just finished a crop and are clean and healthy, may be top-dressed, pruned, and started for the second time. Seedlings raised as advised will be ready for planting, and will soon furnish the trellis if well looked after. This lot will furnish the latest supply. Late Melons should possess thick rind, as these keep better than the thin rinds. Melons for fruiting late should be

grown in a well-heated pit, so that the grower is provided against damp and mildew. Plants just swelling off their fruits should be top-dressed and often supplied with a liquid-manure, and the laterals removed where not required. Blooms will now set very freely, but late fruiterers should not be allowed to carry more than four fruits. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

EUCHARIS AMAZONICA.—Although several new species of *Eucharis* have been introduced of late years, *E. amazonica*, which was the first that we had, is still the best, the others having failed to replace it in the estimation of gardeners. But few growers can induce the new species to flower as freely as the *E. amazonica* will when well managed. The plant is a very accommodating one, so that where a sufficient stock of it is at hand, flowers may be obtained during the greater part of the year. Plants which have just finished blooming, and which will be required to flower again towards the end of the year, should be encouraged to make strong growth, by placing them in a moderately warm temperature, but avoiding a too moist one, and admitting a reasonable amount of fresh air daily. Be careful not to expose the plants to too much light, as the *Eucharis* is very impatient of being exposed to the sun's rays; therefore a sufficient amount of shade should be afforded them. How often do we meet with the finest examples of *Eucharis amazonica* growing in ill-lighted, old-fashioned houses. Large plants may be divided at any time during the summer, so long as there is enough time for the plant to get well-established before the winter sets in; but care must be taken not to disturb them whilst they are making fresh growth, and the best time is when the leaves are matured, and the plants have been resting. Examples of moderate size, and which do not require to be divided, but simply to have more space for their roots, may be shifted at any time, as all that is required is the removal of the old drainage. Specimens in 12 inch pots will be found quite large enough for general purposes, but should one or two larger examples be required for special purposes, all that will be necessary will be to shift them into pots or tubs, in proportion to their size.

CALLICARPA PURPUREA (fig. 13, p. 101).—Young stock of this most effective berry-bearing plant raised from cuttings or seed last spring should now be moved into larger pots, so that the plants may attain good size before the autumn. The leading shoots will require pinching back occasionally, as the plant itself is naturally thin and straggling in growth. A good compost for it consists of two parts good loam, one of leaf-soil, and one of rotted manure, and sand in proportion. Grow the plants close to the glass in an intermediate-house, shading them from bright sun, and syringing them freely when closing the house about 3.30 P.M.; also be careful not to allow them at any time to become dry at the roots, or the foliage will suffer greatly.

CHRYSANTHEMUM FRUTESCENS—Plants of this, which are intended for late blooming, should now be repotted, so as to keep them growing freely. Keep the whole stock free from aphides, and go over the plants frequently, and on the first appearance of the leaf-miner, crush all the affected leaves between the finger and thumb, so as to kill the grub effectively, or the plants will be spoilt. Should there be any deficiency of plants, lose no time in getting the required number of cuttings put in, choosing the young tender shoots, always discarding those which are inclined to flower, as these will not strike so freely, nor grow satisfactorily after they are rooted. *R. Milner, Penrice Castle, Swansea.*

THE KITCHEN GARDEN.

CELERY.—Some gardeners for want of ground cannot put out their Celery plants until the earliest crops of Peas are cleared off. As soon as possible the trenches should now be dug out and well manured. Before lifting the plants, well water the bed in which they are standing, and take them up with large masses of roots and soil, quickly planting them in the trenches, and watering them directly afterwards; should the weather be bright, shade the plants a little for a few days. The after-watering of the plants in dry weather must be carefully attended to, and weeds diligently removed. Having planted the early crops of Celery, the plants from later sowings should be got out without much delay into similar trenches, always keeping plenty of soil about the roots when lifting them, bearing in mind the fact that the evening is the best time to transplant Celery, unless the weather

be showery, when every advantage should be taken of such kind of weather to finish the job of Celery planting. The earliest planted Celery is now growing apace, and should be afforded frequent waterings with weak liquid manure; strong manure causes coarseness of leaf-stalk and hollowness. Keep them free of suckers, but do not earth-up before they have attained almost full size.

TURNIPS.—A good breadth of this vegetable should be sown for winter supply. The bulbs from this sowing will be of moderate size, and may be trusted to keep sound during that season. Red Globe, Snowball, Greentop Round, and Golden Ball are undoubtedly among the best varieties of the Turnip for garden crops; but it is advisable to sow a small quantity of Chirk Castle for the latest use, it being a variety that remains firm longer than any other white-fleshed Turnip. Chirk Castle has a black exterior, but the flesh is perfectly white. It will not be necessary to make much preparation for this crop, and as a rule manure will not be needed unless the ground is in an impoverished state, then it ought to be rotten dung, bone-dust, or some other artificial manure rich in phosphates, in preference to anything that contains much nitrogen. A piece of ground from which the early Cauliflowers has been cleared will be suitable, forking it over lightly, breaking it down, and levelling it. The seed should be sown in shallow drills, 16 inches apart, and the plants thinned as soon as they are ready, leaving them at about 9 inches. At this season it is well to sow rather thicker in case the Turnip-fly should attack the plants, and if that should occur, give a good dressing of wood-ashes and soot in a dry state when the leaves are damp, and repeat it as often as may be necessary. An occasional hoeing to keep down weeds will be all the attention the crop will require until fully grown.

HERBS.—Mint, Balm, Pennyroyal, Sweet Marjoram, Hyssop, Sage, Lavender, Camomile flowers, Marygold, &c., may be cut or gathered for drying for winter use. Most of these herbs should be cut when nearly in full growth, and coming into flower; and Lavender, Marygold, and Camomile when in full bloom. Cut them when quite dry, and spread out or hang up in a dry, airy, shady place. This is also the proper time to gather herbs for distillation. *C. J. Waite, Glenhurst Gardens, Esher.*

THE FLOWER GARDEN.

BORDER CARNATIONS.—Layering is the mode usually adopted in the propagating of Carnations, Picotees, and Pinks, and the earlier it is performed in August the better. If a little light loamy soil is placed around and underneath the plants, with a surfacing of sand, the layers will root more quickly than would otherwise be the case. In layering, remove a few of the bottom leaves with a sharp knife, and cut the shoot half-way through, just below a joint where the shoot has acquired some degree of solidity, and cut in an upward direction for about 1 inch, then bend the stem of the plant down to the prepared soil, inserting therein the tongue formed by the upward cut, and secure the shoot with a hooked peg. It is good practice to just top the grass of the shoot layered. A few hundred layers may be made by an experienced hand in this way in a few hours; care, however, should be taken not to cut the stem too far through, and not to break the "shoots" operated on in the act of bending it downwards. Water should be afforded through a rose water-can to settle the soil about the layers, and also every afternoon in dry weather until roots are formed in good numbers. Thus treated, the layered shoots will be sufficiently rooted by the end of September to detach from the parent plants, cutting them off at the joint at which they were layered, and taking them up with compact lumps of soil and roots, and either potting them singly into 3-inch pots, and standing them on sifted coal-ashes in a cold pit or frame near to the glass during the winter months for transplanting out-of-doors early in March, or be planted out at once.

CUTTINGS OR PIPINGS.—Where pipings of varieties are obtained from a distance, as frequently happens at this season, the following simple and effectual method of procedure may be employed to strike them. Place one or more hand-glasses, according to the number of cuttings to be put in, over a bed of fine sandy loam and leaf-mould, with a surfacing of sand, a few inches deep; into this dibble the cutting 2 inches apart every way. The pipings should be about 3 inches long, the lower pair of leaves being removed by a sharp knife, and the

end cut square across a little below the joint before being dibbled into the soil, afterwards watering them gently. Keep the light, or lights, close, and shaded from bright sun, until the pipings are rooted, when the shading must be no longer used, and a little fresh air admitted, gradually at first, and increasing the amount until the rooted cuttings are either potted up, or planted out on a west border. If large quantities of plants are to be raised from cuttings, a shallow frame should be placed on a gentle hot-bed, placing therein sufficient half-rotted dung, and 3 or 4 inches deep of fine soil, so as to bring the surface of the bed to within a like distance of the glass, covering this with sand to the depth of half an inch, and then dibble the cuttings into it, as described above, pressing the soil about the individual pipings in putting them in with the dibble. The frame should be kept close, and be shaded during the heat of the day, admitting a little fresh air every day to disperse or prevent too much moisture settling on the cuttings.

ROSES.—Cuttings of the different sections of the Rose desired to be propagated may be readily struck, if taken off with a "heel"—that is, a piece of the old or ripened wood attached—in the manner recommended for Carnations and Pelargoniums. Wherever the removal of cuttings from the several sections of the Pelargonium will effect an improvement in the appearance of the beds, it should be done forthwith, putting the cutting in shallow boxes of uniform dimensions, provided with a few holes in the bottom, these being covered with potsherds and a few handfuls of leaves for drainage, and then filled with light soil, with a surfacing of sand, a space of 3 inches being allowed between the individual cuttings. Stand the box in a dry situation fully exposed to the sun, and sprinkle the cuttings overhead on the afternoons of bright days to freshen them up. *W. H. Ward, Longford Castle, Salisbury.*

THE HARDY FRUIT GARDEN.

SUMMER PRUNING.—To give the fruit every chance of full development, the summer pruning of the various trees and bushes should be attended to forthwith. In doing this, do not shorten back the shoots too hard, as at this season severe cutting back might be followed by a burst of new growth at the base of the shoots, and much closer to the main branches than is desirable. Secure neatly to the walls or trellises all leading shoots of Pears, and where the allotted room has not been filled up, be careful not to place the fastenings too near the ends of such shoots, nor tie too tightly. If very large fruits are required for dessert or exhibition, the thinning should be severely practised, and only those which are the best placed, that is, the most exposed to the sun, should be reserved. Freely mulch the roots with farmyard dung, and afford water to the roots, but not giving quite cold water. After the pruning is finished, gather up the shoots which are of use in fastening back the young growths of Peaches, Plums, Morello Cherries, Apricots, &c., and finish up with a thorough tidying up of the borders, for no matter however well the walls may be clothed, or the trees trained, an untidy border has a bad appearance.

Pear Doyenné d'Été, and other early varieties, should never be allowed to get dry at the roots, and as these pears will soon be ripe, assistance should be afforded the trees before the fruit ripens; the neglect of this is a great drawback to many of our early fruits. These Pears are better flavoured when gathered a day or two before they are ripe, and placed in a cool room.

EARLY PEACHES.—Such early sorts as the Waterloo, Alexander, Ausden, followed by Hal's Early, Condor, Early Louise, and Early York, should receive good treatment to help the fruits to swell to a passable size, especially the first-named, as these ripen up very quickly, and if not attended to early, the fruits are apt to be small. Remove or push aside the leaves so as to expose the fruits to the sun. Use the garden-engine regularly in hot weather until signs of colouring appear.

RASPBERRIES.—Cut away all suckers springing up in the alleys, excepting such as may have been left for stock. When the fruit is gathered and the old canes are no longer of use, cut them out and most of the young canes, reserving five or seven of the strongest on each stool. If the soil be light, or in an impoverished state, afford it another dressing of rich manure, and apply liquid manure; heavy soils, inclined to wetness, will be the better for a dressing of leaf-mould or spent Mushroom dung, attending well to the young suckers recently pulled up and planted, and seeing that they are supplied with water. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

SATURDAY, AUG. 1—Ripley (Derby).

SALES.

TUESDAY, JULY 28 { Orchids and Lillium Harrisii, at
Protheroe & Morris' Rooms.
THURSDAY, JULY 30 { Established Orchids, in flower and
bud, and 9000 Lillium Harrisii, at
Stevens' Rooms.
FRIDAY, JULY 31 { Established and Imported Orchids
by order of Messrs. Seeger & Tropp,
at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°·3.

Our Fruit Report.

THIS week we are enabled, by the courtesy of our correspondents in all parts of the country, to give an abstract, comprising the general condition of the fruit crops at the present time. The fuller comments will be given in a succeeding issue, but enough is now published to afford a general idea, both of those crops which are practically over, as the Strawberries, and those which are to come. Commercially it is the Apple crop which is of most importance, and out of some 200 reports, we find that sixty-seven in England and fourteen in Scotland report an average crop of good quality. As these reports are for the most part furnished year by year from the same districts, by the same correspondents, the statement may be taken as a near approach to accuracy; only seventeen in England and four in Scotland report an over-average crop of Apples, whilst fifty-seven in England, and eighteen in Scotland report an under-average crop.

Of course, some counties are more especially fruit districts, whilst others are less distinctly concerned in fruit culture; thus, if we take Kent, as specially important from this point of view, we find that in this favoured county, Apples are generally both abundant and of good quality, though in certain districts round Sittingbourne and Boughton apples are "very short." In Middlesex, though the crop is reported under average, the quality is good. In Surrey, an average is recorded; Sussex scores a little better; Gloucestershire notes an average crop, as also do Hereford, Worcester, and Devon.

Plums, which come next in order of commercial importance, show thirteen in Scotland and forty-four in England under average. Sixteen districts in Scotland and forty-two in England show average returns, whilst six Scottish and fifty-two English reports show an average

crop. The Western Counties are specially Plum counties, and we find Devonshire, Worcester, and also Kent recording over average, whilst Gloucestershire is behindhand.

Cherries throughout the British isles show sixty-five under, ninety-two average, and seventeen over average. Kent, the most important of all in this respect, does not come out well; and our Sittingbourne reports given last week were specially bad, though elsewhere as at Boughton they are if not abundant at least good.

Small fruits, which are less dependent on climatal derangements than some others, show eight under average in Scotland, forty in England. Average crops are noted in twenty-four Scottish, and sixty-five English reports: seven over average in Scotland, and thirty-six in England. Red and black currants are disappointing in Kent. Where also gooseberries are noted as only middling. These remarks apply to all parts of the country.

Strawberries have done well; only two in Scotland are recorded as under average, and fourteen in England, whilst twenty-three in Scotland, and seventy-nine in England, are named as yielding average supplies; fifteen in Scotland, and no fewer than forty-seven in England, being over the mark. The great Strawberry counties, such as Kent, on the whole report favourably. As many as sixty tons were sent away from St. Mary Cray Station in one day lately, being fourteen tons in excess of the largest quantity last year.

Nuts, including Filberts and Walnuts, are not much grown in some districts, and seem variable everywhere; thus, in Scotland, two are reported as bad, sixty-one in England no better; two in Scotland and thirty-three in England report an average; and six in England are over the average.

The English Apple crop is, as every one knows, severely tried by competition with Canada and the United States, and lately with Tasmania. Allowances must, however, be made for differences of season and climate. As to soft fruits and Strawberries, the competition is entirely in our favour, a point which would be fruit-growers will not fail to note.

We defer any further comment till we are enabled to publish the full details.

AN INDIAN TODDY PALM—PHŒNIX SYLVESTRIS.—A familiar and perhaps, to some people, a monotonous feature in Indian scenery, particularly along the coast regions of Western India, are the groves of Phœnix sylvestris, one of the toddy Palms, the commonest of the wild Palms of the country, but a most valuable one to the natives. It is frequently seen in company with another noble Palm, *Borassus flabelliformis*, the Palmyra, and these, together with the Cocoa-nut Palm, which, in the neighbourhood of Bombay, is cultivated in extensive plantations, comprise the chief elements of that striking tropical scenery which always impresses travellers from northern regions when they first see it. This Phœnix does not differ materially in aspect from the Date Palm of Egypt, *P. dactylifera*, which one sees on the way out; and my impression that the Date Palm, as well as such Phœnixes as *P. rupicola*, *tenuis*, *acaulis*, *canariensis*, and possibly others, are but geographical forms of a widely-distributed species, having a range almost as extensive as that of the Cocoa-nut Palm. Be this as it may, they all seem to me very much alike, and from my point of view produce the same effect, for in a natural grove of *P. sylvestris* one could select forms that to all appearances are identical with the species named. The Palm now illustrated is not the only one that yields toddy, as there are several in India from which the enticing juice can be drawn, notably the Palmyra, Cocoa-nut and Wine Palm (*Caryota urens*), but in

Guzerat the Phœnix yields the bulk of the enormous quantity of toddy that is consumed by the natives. Toddy drawing is, in fact, an important industry, and moreover a source of revenue to the Government, as a tax is imposed upon every tree in full yield, and to which an official number is attached. A large plantation of Phœnix is a valuable property, for the owners assess their value at from five to fifteen rupees a tree. If a plantation is near a town or group of villages, or near a frequented highway, the drawing and distribution of toddy is always active, and keeps several people busy. The mode of drawing is admirably shown in the picture. The toddy man is in the act of fixing a "chattie" at the mouth of a notch that has previously been made in the succulent part of the stem, the incision being made so that the descending sap trickles into the vessel, a few strips of reed being placed so as to conduct the juice more readily. The chatties are emptied morning and evening, and, as they hold a quart or more, a great quantity of sap is extracted from each tree during the season; and the loss tells materially on the health of the tree, so much so that if the extraction were to continue year after year, the tree would soon die from exhaustion. After a tree has been tapped for a full season, it is allowed to rest for two or three seasons, and that accounts for the intervals of the scars on the trunk, as may be seen in the picture where the man has his left foot and the scar lower down. The toddy drawer is possessed of surprising agility in climbing the perpendicular stems, which he does with the utmost ease, the only support being the rope he has fastened round his waist, which leaves his hands free. The fluid thus obtained is of the consistence of watered milk, and has a sweetish, and to some Europeans an agreeable taste, while to others it is nauseating. When freshly drawn it is most refreshing, and to quaff a bowl of it when excessively thirsty is one of the pleasantest incidents in Indian life. When, however, it is allowed to ferment, which it quickly does, it is sour and unpleasant, and becomes as intoxicating as Scotch nectar but in this state it obviously finds more favour with the natives. As a garden plant, the wild Phœnix is of great value for landscape effect when it occurs in natural groups, for in these you see all gradations of size, from the small seedling to the decrepit old trees, that have reached the length of their days, and lean leewards in a most picturesque way. The bluish-grey-green tint of a grove of Phœnix is perhaps too sombre, but in a garden one can always introduce variety as a foreground, or intermixed in the group. It is a singular fact, that the Date-bearing Palm does not thrive successfully in India, so as to produce edible fruit, and that of *P. sylvestris* is valueless as food, though the leaves and stems, and the fibre and bark thereof, are of value to the natives in various ways. The engraving (fig. 14) is an admirable reproduction of a photograph by Messrs. JOHNSON & HOFFMAN, of Calcutta. *W. Goldring.*

THE POTATO TRADE IN NEWCASTLE.—The importance of the Potato trade of Newcastle has been considerably emphasized during the past season, in consequence of an acceptable display of enterprise on the part of the shippers and some of our principal local merchants. This enterprise, in all probability, has resulted from the inconveniently fluctuating state of the market, and for the first time it is to be recorded that Potatoes have been brought direct by steamer from Ireland to the Tyne. The venture, which has been in the hands of the agents for the Antrim line of steamers, Messrs. LISLE & Co., Baltic Chambers, Newcastle, has been carried on with a gratifying success, and the new trade will undoubtedly continue so long as the supply in Ireland is good. On a rough calculation, about 4000 tons have been brought to Newcastle by this line of steamers, which trades between Belfast and the Tyne *via* the North of Scotland. The arrivals continued to increase in quantity after the first introduction, and it only need be mentioned to indicate the extent to which the Scotch Potato trade of Newcastle was affected, that in one week alone as many as 680 tons were landed.

FIG. 11.—*PHOENIX SYLVESTRIS*, AN INDIAN "TODDY" PALM. A TODDY-DRAWER AT WORK. (SEE P. 104.)

THE FRUITERS' COMPANY AND FRUIT CULTURE.—Already, says the *City Press*, July 18, we are gratified to learn, a substantial amount has been raised in connection with the fruit culture scheme that has been set on foot by the Fruiterers' Company. The Company head the list of subscriptions with a donation of £500—a most munificent grant, having regard to the comparative poverty of the Guild. Other donors include:—The Corporation, £250; the Duke of Westminster, K.G., £150; Alderman Sir James Whithead, Bart., £100; the Duke of Bedford, £50; the Right Hon. W. H. Smith, M.P., £20; Colonel North, £25; the Baroness Bardett-Coutts, £100; Sir H. A. Isaacs, £10 10s.; Messrs. Crosse & Blackwell, £52 10s.; Mr. C. J. Leaf, £10; Sir W. A. Ogg, £25; Mr. H. R. Williams, £25; Mr. H. R. Williams (second donation), £46; Mr. H. Martin (Rent-warden of the Fruiterers' Company), £25; the Drapers' Company, £105; the Clothworkers' Company, £100; the Mercers' Company, £52 10s.; the Leather-sellers' Company, £26 5s.; the Skinners' Company, £26 5s.; Mr. G. Farmiloe, £10 10s.; Mr. A. H. Smeo, £25; Mr. G. Williams, £10 10s. The Lord Mayor has opened a fund at the Mansion House, and intending donors should therefore forward their cheques to his Lordship.

— We are glad to find a general agreement of opinion as to the unfortunate omission at the meeting at the Mansion House reported last week. The Royal Horticultural Society, sadly hampered as it has been, has done such really splendid service in the cause of fruit-culture for many years past, and especially by its conferences and publications; and the British Fruit Growers' Association has so valiantly and energetically taken up the subject during the last few years, that the omission to make some note of these facts, which we believe to have been unintentional, was really a cruel injustice, especially to the Royal Horticultural Society. This body deserved much better treatment at the hands of the Minister of Agriculture, who, as Minister for Horticulture and Forestry also, ought to have been better informed of the sacrifices and deeds of the Society and its younger ally.

WEED KILLERS.—We understand that the Pharmaceutical Society has instituted proceedings against one of our leading nurserymen for selling these substances, or one of them, without having a licence to sell poisons. Considering the numerous accidents with these fluids, it is in the public interest that they should be retailed in bottles of peculiar shape, prominently labelled "POISON." The label should also state for what purpose only the liquid is employed. We do not think nurserymen or dealers in garden requisites would raise any objection to some precautionary measure of this kind. In these days of insecticides, to prevent nurserymen absolutely from selling these substances would be injudicious; but that some special precautions are necessary, is unfortunately too true.

FLORIST'S WIRE TIDY.—At the last meeting of the Royal Horticultural Society at Chiswick, a useful little exhibit, which possibly escaped critical notice by visitors, deserves mention. It consisted of some samples of various sizes, labelled "Florist's Wire Tidy." The wire is placed on reels of strong tin, Japanese inside and out; the reels revolve on spindles, and can be removed at will. To the gardener and florist they would seem to be indispensable, preventing confusion, and saving both time and worry; they also effect a considerable saving in material, as each size of wire required for binding and mounting can be kept separately, and will not be scattered about and wasted as in the old method. It is the invention of Mr. BUNYARD, The Nurseries, Ashford, Kent, the patent rights having been bought by Messrs. BLAKE & MCKENZIE, Liverpool.

STOCK-TAKING: JUNE.—To those with the opportunity (and time) the Board of Trade Returns for the past month present very many features of interest, and in both sections, viz., imports and

exports. For us we have only the necessity for summarising and recording an inference or two. The following is our usual excerpt from the "Summary" of the returns for June, as to imports:—

	1890.	1891.	Difference.
	£.	£.	£.
Total value of imports	£32,926,295	£36,850,121	+3,923,826
§II.—(A.) Articles of food and drink—duty free ...	11,709,613	13,351,112	+1,641,499
(B.)—do., dutiable	1,531,456	1,873,006	+341,550
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	5,418,813	6,493,954	+1,075,141
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,663,424	3,963,939	+300,515
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	774,044	1,111,061	+337,017
(B.)—Parcel Post ...	39,804	44,987	+5,183

The exports for the past six months show an increase of £5,364,782 over the corresponding period of last year. In the matter of exports for the month just closed, there is an increase under every head save one (yarns, textile manufactures, &c.), and this reduces the total by £93,418 under that for June 1, 1890. The exports for the six months ending June 30, show a reduction of £3,189,713. These exports are of articles of British and Irish manufacture; there is also a falling off in the export of articles of foreign produce. It may not be out of place to note here, respecting the imports of wood or timber, that the imports of hewn timber for the past six months are set down at 951,453 loads, as against 953,094 loads for the same term in the previous year. Sawn timber is placed at 1,122,206 loads for the past six months, as against 1,257,537 loads for the past six months of 1890. It would be almost wrong to omit, in this connection, some few figures bearing on the policy of our cousins on the other side of the Atlantic. The revenue returns for the last fiscal year in the United States do not show the usual abounding surplus. Whilst the revenue amounted to 392,470,752 do's., the expenditure for the year was 365,447,275 do's., which leaves the comparatively small surplus of 27,023,477 do's., or only between five and six millions sterling. Why this is so, is because there has been a diminution of revenue and an increase in state expenses. Protection has considerably reduced imports, and the collection of duty necessitates an immense increase in staff and "appliances" necessary for its collection. We know all about that sort of thing here; and have in great part done with it. But enough of that, we come finally to a few extracts from the general figures of those returns relating to the imports of fruits, roots, and vegetables for the month of June compared with those for June, 1890:—

	1890.	1891.	Difference
§ II. Fruit:—			
Apples, raw ... bush.	8,798	64,031	+55,233
Unenumerated, raw	251,874	213,164	-38,710
Onions	171,880	259,742	+87,862
Potatos cwt.	1954,287	836,058	-1,118,229
Vegetables, raw, unenumerated value	£101,565	117,681	+16,116

JULY HORTICULTURAL MEETING AT GHENT.—Thirty-one exhibits were staged, and the following Certificates of Merit were awarded: 1st, Variegated Rose, No. 6092, to Mlle. E. Guequier, ground pink with white markings; 2, English Mignardise Carnations, large blooms, to the same exhibitor, very pretty varieties of distinct colourings; 3, Nidularium Makoyanum, to M. Aug. Van Geert, a good and noteworthy plant with striped foliage; 4, Asplenium caryotaefolium, to the same exhibitor, the foliage was

exceedingly pretty and exactly like that of a Carrot; 5, Curmeria Leopoldi, to the same exhibitor, very finely foliaged plant, which will become very popular; 6, Kentia Fosteriana, var. robusta, to M. Millet-Richard, stems and leaves exceedingly substantial and firm in texture, a fine example; 7, Cattleya Mossie alba (Wagneri), unanimously awarded to M. Jules Hye; 8, Odontoglossum Alexandræ grandiflorum, to the same exhibitor, a very fine flower and most remarkable variety; 9, Cattleya gigas marmorata, to MM. Ed. Vervaeet et Cie., petals nicely speckled, quite a distinct variety; 10, Phaius Humblotii, to M. A. van Imshoot, with fine blooms; 11, Cycnoches chlorochilum, to the same exhibitor, an exceedingly curious plant. Certificates of Merit for cultivation and flowering, were awarded for: 1, Asparagus virgatus, to M. Desmet Duvivier, a large and fine plant from an horticulturist, who is endeavouring to form a complete collection of plants of this genus; 2, Abies alba compacta gracilis, to the same exhibitor, truly a graceful specimen; 3, Odontoglossum mulus illustris, to M. Ch. Vuylsteke, in full bloom, the flowers of good form; 4, Oncidium macranthum, to M. Jules Hye, an interesting and well-bloomed variety; 5, Lælia purpurata Brysiana, to MM. Ed. Vervaeet et Cie., a plant still very rare, shown with fifteen splendid blooms; 6, Cattleya Mendeli, to the same exhibitor, a remarkable plant with thirteen flowers; 7, Mormodes luxatum eburneum, to M. van Imshoot, a fine example; 8, Vriisia Sieboldiana, to MM. F. Desbois et Cie., a very pretty and noteworthy plant with translucent bracts. The jury also awarded many "honourable mentions." *C. de B.*

THE "BOTANICAL MAGAZINE."—The July number contains illustrations of:—

Musa Basjoo, t. 7182, a Banana, remarkable for its hardihood, as it survived several winters at Combe Wood, in Messrs. VETTON'S nurseries. Now that it has flowered in the temperate-house at Kew, it has been identified as "*M. Basjoo*," a species native to the Liu-Kiu Archipelago, to the south of Japan, where it is cultivated for the sake of the fibre in its leaves. In general appearance, it is quite like *M. sapientum*, but its floral characteristics are different.

Hibiscus venustus, t. 7183—A shrubby species, with large handsome cream-coloured flowers. It is supposed to have been procured from Tahiti, and was flowered in the garden of A. KINGSMILL, Esq., of Hurrow.

Synlœnia arborescens, t. 7184.—A succulent Euphorbiad, with obovate leaves and terminal corymbs of greenish flowers. A botanical curiosity.

Masdevallia platyglossa, t. 7185.—A species with long pendulous flower-stalks, bearing irregular bell-shaped pale yellow flowers, about an inch in length. Its nearest ally is stated to be *M. coriacea*, *alias* *M. Bruchmulleri*.

Stenoglottis longifolia, t. 7186.—A striking-looking terrestrial Orchid, from Natal, with long undulate leaves, spotted on the under surface, decreasing in size gradually upwards on the stem, which ends in a long rather dense raceme of dull violet flowers.

CATTELEYA BRYMERIANA.—This beautiful hybrid is now in bloom for the first time in Belgium, in one of the houses of M. PEETERS, at Brussels. The plant exhibits many of the characteristics of *C. superba*, the flower those of *C. Eldorado*. *Cattleya Mossie alba* or *Wagneri* should also be mentioned, and *Odontoglossum Harryanum*, in which the general colouring is clearer than usual, while the tips of the sepals and petals are of an unusual shade of golden-yellow. The very rare *Odontoglossum vexillarium* var. *superba* is also now in bloom under favourable circumstances.

AGRICULTURAL EDUCATION.—The committee appointed by the Hebdomadal Council, Oxford, to consider in what way the University could assist in the establishment of agricultural education, with a special view to the needs of the County Councils, have now submitted their report. By agricultural education, the committee understand instruction in the sciences, or the branches of science, specially applicable to agriculture, employing the latter term

with the larger meaning which must have been present to the mind of Dr. SIMMONS, when he designated the professorship founded by him, the professorship of "Rural Economy." Used in this sense, agriculture becomes not merely the science of the cultivation of the soil, but includes the knowledge of its constitution and properties, of its vegetable products, and of the structure, habits, and uses of the domestic animals that are reared upon it; so that the student has evidently much to gain by a knowledge of such subjects as botany, chemistry, animal physiology, and geology. Taking into account the requirements of the County Councils, the committee think that the efforts of the University should, in the first place, be directed to the provision of an adequate supply of persons qualified to be lecturers or teachers; and those members who are most familiar with the wants of the counties, lay stress upon the importance of University teachers possessing credentials of practical acquaintance with the details of farming and farm-life, which has hitherto been only accidentally—if at all—acquired by such teachers. Other classes of persons whose circumstances the committee think deserving of consideration, are young men who go to Oxford intending to take an ordinary degree, and then, either as landowners, or the agents of landowners, to devote themselves to the pursuit and improvement of agriculture; and young men who might go to Oxford with a view to attending such courses of instruction as would be useful to them in agriculture, but without the intention of taking a degree. Dealing with the means already at the command of the University for providing agricultural education, the Committee point out, that the professors to whose services resort would most naturally be had are the following:—The Sibthorpe Professor of Rural Economy, the Sherardian Professor of Botany, the Waynflete Professor of Chemistry, the Waynflete Professor of Physiology, and the Professor of Experimental Philosophy (Physics). In addition to these University professors, there are the Lee's Readers in Chemistry and Physics at Christ Church, and the Millard Lecturer in Physics at Trinity College, whose courses would probably be open to agricultural students. The committee sketch the proper course of study for each class of students, and express the opinion that for the organisation and supervision of the studies pertaining to agricultural education some further provision is needed than at present exists. In the Sibthorpe Professorship of Rural Economy, which is now vacant, they recognise a foundation capable of being rendered the centre of agricultural education within the University; and they strongly recommend that the duties and emoluments of the chair should be revised.

LIPARIS MONACHA.—This most destructive caterpillar, after having destroyed the Pine plantations of parts of Bavaria, is attacking those of Belgium. Millions of insects have been destroyed, but milliards require to be immolated, as whole woods are destroyed by the creature.

TRUE BLUE VIOLA.—A large bed of this excellent variety is now in full bloom at the Birmingham Botanic Gardens, and has been so since early in April. It was raised by Mr. W. DEAN some years ago, and is the most blue-shaded variety known, and is of dwarf compact stiff habit, and a wonderful bloomer, and stands hot weather better than a great many varieties. Mr. LATHAM thinks highly of this variety.

THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY.—The first exhibition of this Society will be held in the Botanic Gardens, Birmingham, on Saturday, August 8, and nearly £70 is offered in prizes. Notice of entries must reach the Secretary, or Mr. ROBERT SYDENHAM, Tenby Street, Birmingham, not later than the morning of Tuesday, August 4. There is a special class for border Carnations also.

HELENSBURGH FLOWER SHOW.—"Among the Rothsay florists exhibiting at this show on Thursday, July 17," says the *Rothsay Chronicle*, July 18, "was Mr. M. CURRIERSON, of the Public Park Nursery, and his collection was considered of such merit by the judges, that they awarded him a Silver Medal as an extra prize. Mr. CURRIERSON'S exhibit contained more than forty varieties of hardy border flowers, tastefully arranged in bouquets and sprays; also sixty blooms of fancy Pansies, including two seedlings—Mrs. M. Cuthbertson and Edith Crossley, which come up to the florists' standard, and are likely to be further heard of in the competition lists. *Campanula persicifolia* Cuthbertsoni, new, also attracted attention, being a great improvement on the ordinary variety."

HAMMERSMITH HORTICULTURAL SOCIETY.—The twelfth annual exhibition of this Society took place on the 16th inst., and proved to be a successful affair, the show being somewhat larger than usual. In the gardeners' class for a group of plants arranged for effect, the successful competitor was Mr. HODGE, gr. to J. J. FORD, Esq., Parkside, Ravenscourt Park, W., with a charming display. In the amateur's division (group for effect class) the premier position was won by Mr. J. BUOMLEY, Miles Street, Hammersmith. Mr. JOHN ADDISON, gr. to Mrs. LLOYD, Merton Lodge, Chiswick, won the 1st prize for six fine examples of Exotic Ferns. Mr. M. T. MAY, gr. to the Marquis of BURE, Chiswick House, Chiswick, contributed (not for competition) a beautiful, well-arranged group of foliage and flowering plants, which added much to the attractiveness of the exhibition. Mr. GEORGE CANNON, manager to Messrs. C. LEE & SON, Faling, sent some fine blooms of Roses, also not for competition, and which were greatly admired.

ROYAL COUNTIES AGRICULTURAL SOCIETY'S SHOW AT PORTSMOUTH.—The Council of the Royal Counties Agricultural Society gratefully accepted the offer made by Messrs. SUTTON & SONS, the Queen's Seedsmen, Reading, to gratuitously undertake the floral decorations of the Royal box in the Grand Stand, and we need hardly state it was carried out in a manner worthy of the occasion. The whole interior of the box was tastefully decorated with flowers, consisting of Calendula, Canterbury Bells, annual Chrysanthemums, Clarkia, Delphinium, Hawkweed, Linaria, Sweet Pea, Sweet William, &c., from Messrs. SUTTON'S seed trial farm at Reading. In front was a charming display of a new Begonia raised by the firm, named the Duchess of Edinburgh, colour white, suffused with pink, this being the first time of its exhibition.

THE BERMUDA JUNIPER.—In *Garden and Forest* for June, 1824, is an interesting article on the Bermuda Cedar, *Juniperus bermudiana*, which formed the subject of an interesting article in our pages by Mr. HEMSLEY some time since. The writer points out the close resemblance of the Bermuda plant to the Red Cedar, *Juniperus virginiana*, which grows from Canada to Florida; and from Cape Cod to Vancouver. The Red Cedar, it is known, was growing on the American Continent long before Bermuda arose from above the surface of the ocean. It is surmised then, that when the islands did appear, a bird may have conveyed in his crop a number of the Juniper berries, which germinated on the island. Once established, the different soil and climate may have gradually modified the plant, so that at length the Bermuda Juniper became specifically distinct, as we esteem it, from the continental type. The wood was formerly used in shipbuilding, and for furniture, and but few old trees now remain. The younger ones are remarkable for the fact that they flourish equally well in very different situations on dry porous limestone and brackish swampy land.

EEL-WORMS IN STRAWBERRIES.—The first number of the *Zeitschrift für Pflanzen Krankheiten*, a new journal devoted to the diffusion of information concerning the diseases of plants, has a paper on

a curious hypertrophy of the stem of the Strawberry caused by the nematode worms described by Dr. RITZEMA BOS under the names of *Aphelenchus fragariae* and of *A. ormerodis* respectively.

BOTANICAL ILLUSTRATIONS.—We learn from the *Revue Horticole* that M. MALLOIZEL, Librarian at the Jardin des Plantes, has undertaken the publication of a list of all the figures of plants, or of the more important of them, published since PARZEL'S *Iconum Botanicarum Index*. Of what service such a publication will be, few, if any, can know better than ourselves.

HOOKE'S "ICONES PLANTARUM."—The last issued part (June) contains lithographic illustrations of Orchids, chiefly in illustration of, or as supplementary to, the enumeration given by Sir JOSEPH HOOKER in the *Flora of British India*. The species figured are generally of little cultural interest.

MACADAMIA TERNIFOLIA.—The Australian nut, of which we gave a representation in 1870, has, we learn, produced its fruits at Golfe Juan, in the garden of M. A. CONSTANT. An illustration is given in the *Revue Horticole* for July 16.

GOLDEN HORSE CHESTNUT.—Mr. BLAND of the nurseries, Fordham, sends us leaves of Horse Chestnut very finely blotched and variegated with golden-yellow. Judging from the leaves sent to us, this is one of the best golden forms with which we are acquainted.

BEDDING TROPÆOLUM.—Messrs. CLIBRAN sends us flowers of a new dwarf-bedding *Tropæolum* of a very bright clear yolk-yellow colour. It is apparently a free bloomer, and the plants we are informed measure from 4 to 6 inches in height. The colour is decidedly very good. Messrs. CLIBRAN intend to send it out next spring under the name of Mrs. Clibran.

CATTLEYA GIGAS.—Mr. MURRAY, of the gardens, Redholme, Ardrossan, sends us a photograph, showing two flowers of *Cattleya gigas*, each about 9 inches in diameter, the lip measuring 2½ inches, and of a rich magenta crimson. Evidently a fine variety.

STAVELEY WORKS FLOWER SHOW.—The 24th annual show in connection with the Staveley Works Floral and Horticultural Society was held on Monday, 20th inst., in Ringwood Park, Notts, lent by Mr. J. B. BARRON, J.P. The weather was unfavourable, but despite this the attendance was very large. The exhibits, staged in a large marquee, were of an excellent quality.

POTATOS IN THE CHANNEL ISLANDS.—We have received the following letter from Mr. C. B. SAUNDERS, Caserean Nurseries, St. Saviour's, Jersey, July 18:—"I thought you would be pleased to see and probably taste, the Potatos which have been shipped off to the English markets by our Jersey growers. I stated in my report [Will appear shortly, Eo.] last week that the returns made to the island for Potatos would be £400,000; but it appears from further calculations that have been made, that it is more likely to reach £500,000. The samples I now send to you, Royal Jersey Flukes, were grown partly in my own ground and partly in my next neighbour's; the latter are Prince of Wales. In a small island like Jersey, with its 50,000 inhabitants, can make such a splendid return from one crop, it lets some light in upon the theory of 'How the other half of the world lives!' Irrespective of Potatos, large quantities of Grapes and Tomatos are grown here and shipped off, realising a ready sale in the markets of London, Birmingham, Manchester, and other large towns. The question of how it is done is answered: by industry, high cultivation, and careful attention to preparation of plants and tubers before putting sorts where they are to produce the crops, quite as much as by climate. Our Potato growers are artists at the culture, and Tomato growers are not excelled in the ways and means they employ to bring about successful results

The weight of crop of Potatoes reaches the enormous amount of 7 cabots=280 lb., imperial weight, to the perch of 22 feet square—i.e., 'ware' besides this, are the 'seconds' and 'small's.'

ONGAR FLOWER SHOW.—The fourth summer exhibition of the Ongar and District Horticultural Society was held on Wednesday, July 15, in a field kindly lent by the Rev. J. TANNER. The weather turned out most favourably, and the show passed off very successfully. The general exhibits were staged in two spacious marquees, and the cottagers' exhibits in two small marquees, and were quite up to the usual average, the show of flowers being very good. Mr. C. H. F. CHRISTIE, of the Wilderness, kindly threw open his beautiful grounds as a promenade for the visitors to the show, and this proved no small attraction. Great praise is due to the committee for the way in which the arrangements were carried out, and also to the indefatigable Hon. Sec., Dr. SPURDIN, for the hard work he did to make the show a success.

THE READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—This flourishing Society held its first excursion on Wednesday week under most auspicious circumstances, the weather being everything that could be desired. Bleoheim was the place chosen, the Society having received an invitation from the Duke of MARLBOROUGH to visit the grounds and garden of this noted place. A party of about fifty left Reading by the 11.10 train, and on reaching Woodstock were met by Mr. WILLIAMS, the head gardener at Blenheim. The party made their way at once to the Bear Hotel, when luncheon was partaken of, and thence proceeded, under the guidance of Mr. WILLIAMS, to inspect the beauties of Blenheim. The Italian garden and the conservatory were first visited, after which the party went on to the kitchen and fruit gardens, where everything is carried out on an immense scale. The houses were then gone through, and those containing the Orchids excited the admiration of the whole party, the flowers being in splendid condition. The party left Woodstock at 8.10, having experienced an enjoyable outing.

CHILDREN'S FLOWER SHOW.—At the St. Pancras Vestry Hall, on Saturday, July 18, an extensive array of garden flowers cultivated by the children of the Aldenham Street Sunday School in connection with the Presbyterian Church in Regent Square, attracted a considerable gathering of young folks and others interested in their annual competition for prizes. The collection consisted of flowers grown from seed supplied, together with plants that had been distributed at an early stage of growth for careful cultivation. The exhibits numbered over 600, and represented nearly 280 boys and girls. Numerous awards, consisting of money and articles of utility, were distributed by Mrs. AFFLECK FRASER, and amongst the favourite flowers on the prize-list were Nasturtiums, Lupins, scarlet and pink Pelargoniums, Creeping Jenny, and red and white Fuchsia. A programme of bright music was performed by a band, under the direction of Mr. O. H. Bamberger. *Daily News.*

THE BISHOP'S STORTFORD HORTICULTURAL SHOW.—The Committee of the Bishop's Stortford Horticultural Society at a meeting on Thursday, found it desirable to change the date originally fixed for the show to Wednesday, August 19.

EXCURSION TO WITLEY COURT.—On Tuesday last, the employes of the well-known firm of EDWARD WEBB & SONS, Seed and Manure Merchants, Wordsley, Stourbridge, accompanied by Major WENN, took a trip as far as Witley Court, the charming residence of the Earl of DUDLEY.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual picnic of the members of the above Society took place on the 20th inst., in the form of a visit to Ascott Park, Leighton Buzzard, the residence of Leopold de Rothchild, Esq., one of the vice-presidents of the Society; the party numbering between eighty and ninety persons.

NEW BOOK.—A dainty volume, prettily illustrated and elegantly bound, on *Landscape Gardening*, by S. PARSONS, Jun., Superintendent of Parks, New York City, is before us. It will demand further notice at our hands; all we can say for the moment is, that it may be obtained from Messrs. PUTNAM, 27, King William Street, Strand, W.C.

PLANT PORTRAITS.

AÉRIDES HOULLETIANUM, *Revue Horticole*, July 16. —Segments apricot-coloured; lip transversely oblong, two-lobed, white, streaked and dotted with violet.

LACHENALIA COMESII ×. — A cross between *L. reflexa* and *L. quadricolor*. *Gartenflora*, p. 358, 1891.

LACHENALIA REBELIANA ×. — A cross between *L. reflexa* and *L. aurea*. *Gartenflora*, p. 357, 1891.

NEPETA MUSSINI, *Revue Horticole*, July 1, 1891.

PLUM "DESROMAINS."—A seedling raised in the orchard of Dr. Desromains; very fertile, and a good market Plum. *Bulletin d'Arboriculture*, &c., June, 1891.

PARANIS TRICOLOR, Drapeau Belge (*Belgian Standard*).—Colours, red, black, yellow. *Revue de Horticulture Belge*, July 1, 1891.

SPIREA ASTILOIDES VAR. **FLORIBUNDA**, *Revue de l'Horticulture Belge*, July 1, 1891.

WEIGELA EVA RATHKE, *Gartenflora*, t. 1350.

PEACHES AT KETTON HALL, STAMFORD.

The garden at this place, the residence of J. T. Hopwood, Esq., in the pretty Rutlandshire village of the same name, has, of recent years, grown into notoriety for its Peaches and Peach-houses.

The estate is a small one, as are the gardens, but the latter grow bigger as time goes on, and encroach bit by bit on the adjoining meadow. The Peacheries here were described in these pages a few years ago, but the record of a recent visit paid to them may not be without use to the readers of this Journal. The large gothic span-house, built by Mr. Rendle, and glazed by him in the manner associated with his name—that is, large panes placed length-wise of the roof—contains two trees at one end only, to the right and left of the door. One is a Lord Napier Nectarine, a strong tree, with a good crop of fruit, which Mr. Divers, the gardener, said would be ripe in the first week in August. On the other side of the door, is a tree of equal size and vigour, of Victoria Nectarine, which ripens its fruits one month later. The opposite end of this house was covered with two Ivy-leaf Pelargoniums, Albert Crousse, and Madame Crousse, now in full flower, and which have not been without a large border of blossoms since early spring. The house is really a greenhouse, and it is mainly treated as such, the occupants standing on the floor. What is called the "old range," is 180 feet long in divisione. The trees in it, the first division, consisted of three Prince of Wales, two Crimson Galande, and one of Dagmar Peaches. The next division was planted with Royal George, there being three trees; and in the third division, which is the early house, were two of Early Louise and one of Beatrice. These trees show great vigour, and are of large size, and bear annually full crops of the finest fruits.

Another span-roofed Peach-house, with the name of "Carlsbad," is planted in one of its divisions with the following varieties of the Peach:—Bellegarde, Sea Eagle, here a fine autumn fruit, of good flavour; Prince of Wales, which colours well; Early Grosse Mignonne, Barrington, Salway, Lord Palmerston, Princess of Wales, and Early Crawford, a fine showy fruit. Of Nectarines, there are Pineapple, one which Mr. Divers regards as his best late variety; Rivers' Elruge, a large-fruited Seedling of Elruge, of beautiful colour; and Lord Napier; that is, nine varieties of Peaches and three of Nectarines—in all sixteen trees, there being of some more than one tree.

The next division of the above house contains

Nectarinea, Dryden, Lord Napier, Spenser, Violette Hative, and River's Orange; and of Peaches, Abec, Sea Eagle, Alexander, Nectarine Peach, a good late variety, Dymond, Crimson Galande, Lord Palmerstone, and a seedling not yet fruited. These trees are of large size, and are fastened to sloping trellises on each side of the central path, the roots being inside. A row of Figs and Pears, in pots, are placed along each side of the side of the path.

Close to the wall plate, and all round the house, are planted Maréchal Niel Roses, now just making growth, after being cut hard back when their floral harvest was at an end. By this mode of treatment no shade of any account is thrown on the fruit trees, and it is an open question which make the best returns—the Roses or the fruits. When the Roses are in full leaf and flower is the dangerous time for the Peach and Nectarine buds in Rendle's houses, the evils of the sudden bursts of sunshine, which cause a very rapid rise of the temperature, being in great measure averted by the roof-shade afforded by the Roses. A Cherry-house, built with an acute-angled roof, contained Cherries on the north side, and M. Niel Roses on the opposite one. This year the temptation to favour the Roses with a little heat during the flowering period of the Cherries was not resisted, and the Cherry crop was, in consequence, almost a failure.

Yet another Peach-house—a span-roofed one of 100 feet in length, with the Nectarine Peach, Royal George, Prince of Wales, Sea Eagle, Princess of Wales, Stirling Castle, Barrington, Crimson Galande, and Early Albert, a very good variety. It was to a tree of Princess of Wales in this house that sulphate of iron mixed with water, after partially laying bare the roots, was applied with such good results for the yellows (see *Gardeners' Chronicle*, p. 278, 1889). Fruits of Barrington Peach have been grown in this house up to 12 oz. in weight.

To make Mr. Divers' success in growing these fruits the more remarkable, every bit of the soil in which they are grown has to be fetched from a distance, iron being in excess in the soil of the garden, and rendering it inimical to the trees either indoors or out.

All is not ruled by pence, shillings, and pence at Ketton, but the ornamental has a fair share of attention, and we saw small houses in which were a collection of Orchids, a gigantic *Bongainvillea glabra*, *Streptosolen Jamesoni*, employed as a wall creeper; Palms, and general flowering plants. It will be understood that the greater portion of the fruit is disposed of, Peaches fetching for weeks together 30s. per dozen, this of itself bespeaking the excellence of the methods of cultivation pursued.

ENTOMOLOGY.

AN ORCHID-EATER.

A CORRESPONDENT from Duckinfield, Cheshire, has sent us the insect represented in the accompanying wood-cut (fig. 15), and also a leaf of *Lælia majalis* upon which it was caught, in order to show the damage which it had done in a single night. Another plant of *Lælia anceps* was attacked in just the same manner, and as yet the insect had not attacked any other variety of Orchid plants. As the species of Orchids attacked are natives of Mexico, we may, in all probability, imagine that the foreign beetle in question was imported with the plants, and that it also is a native of Mexico or some adjacent part of the New World. It will be noticed that the leaf exhibits a number of dark blotches, and the upper surface of the leaf, under a lens, is seen to be finely corrugated in those parts, although the leaf is not gnawed into holes; the remainder of the leaf being entire and uninjured.

The insect itself, *Eunalcus albo-costatus*, is a beetle belonging to the very numerous tribe of the Longicornia, or long-horns. It belongs to the section in which the prothorax, or neck, is not produced on each side into a spine. It measures nearly half an inch in length, and is of a

luteous grey colour; the front of the head between the eyes rather deeply impressed; the eyes encircle the base of the antennæ, which are rather shorter than the whole body of the insect. The prothorax is convex, and rather conical in shape, with a central whitish narrow line, on each side of which the surface is punctured, and with a narrow line of similar pale colour running parallel to each lateral margin; and there is a shallow, transverse impression running across near the base of this part of the body.

The elytra are moderately long, and simply rounded at the apex, with a narrow space along each side of the suture, with a number of small dark spots, and the disc of each elytron is marked with three narrow raised white lines or costæ, the front of which, next the suture, is slightly curved outwardly to about one-third of its length from the base; it extends nearly to the apex of the elytron, being united to the second line at about one-sixth distance from the apex, and again it is united just before reaching the apex, with the third or outer pale line. The legs are of the usual form, of moderate length, the middle tibiæ simple, and the tarsi of the usual subtetramerous structure.

I am not acquainted with any of the myriads of New World Longicorns exactly agreeing with this species, which appears to belong to Thomson's genus *Eunalcus*, *Systema Cerambyc.*, p. 109; Lacordaire *Gen. Col.*, ix., 627; and to be closely allied to *Eunalcus lineatus* of Bates, figured in the *Biologia Centrali-Americana Zool. Coleopt.*, vol. v., p. 351, pl. 22, fig. 16, which is a native of Mexico and Guatemala, 4 lines long, and having the white longitudinal lines on the elytra straight, and not curved, as in the species before us.

In the economy of Nature it is the duty of this great tribe of long-horned beetles to keep the rank vegetation, especially of the Tropics, in check by feeding on the foliage or burrowing into the solid parts of the plants. The insect before us, by apparently gnawing the upper surface of the leaves, adopts a different mode from those which gnaw and eat distinct patches in the leaves. *L. O. Westwood, Oxford.*

HOME CORRESPONDENCE.

ROSE W. A. RICHARDSON.—I am much obliged for hints as to cultivation by Mr. Piper, at p. 35, but it so happens that we have been "rational" in pruning, leaving it to ramble at will all over the roof of the greenhouse, as suggested by your correspondent, and then it has failed to flower in a satisfactory manner. I think I have, in mentioning the pruning of this Rose in these columns before, said that it should not be pruned hard, if abundant flowering is wanted. Your correspondent's case is, perhaps, exceptional, as I have never seen it bloom so well indoors as in the open. Hereabouts it flowers most profusely upon the open walls, and beautiful it is in the bud state. *W. A. Cook, Compton Bassett.*

PRUNING GOOSEBERRY BUSHES.—I note in the last issue your report of the Hardy Fruit Conference, that it was discussed whether it is better to prune the Gooseberry for the production of fruit or not. It is not possible to decide the matter universally either one way or another, so much depends upon circumstances such as the kind of soil in which the bushes are growing; in some soils there is a great difference as to the manner in which Gooseberry bushes grow and fruit—in one sort of soil they make but little wood, but plenty of fruit, which of course is a means of still further checking growth of shoots. In other places the bushes grow luxuriantly, and require a considerable amount of pruning to keep them within bounds. Under these conditions it is not possible to decide other than by experience. From my experience, a calcareous soil is the best suited to the Gooseberry, and in soil of this character the bushes do not make vigorous growth, and need but little pruning, and hardly ever miss having a crop, except, of course, when frost destroys it before the branches are furnished with foliage to shelter the tender fruit and bloom. A mishap of this kind has nothing to do with the pruning, but is one over which we have little or no control. The soil in this garden is heavy and retentive, not clay, but it rests on a bed of what is akin to clay, except that large

flints abound in it, and when it is worked in wet weather, it gives one the idea of being a kind of clay; below, at variable depths, chalk is found, therefore it cannot be said that this is a chalk soil, but the top spit contains a good deal of chalk, scarcely discernible to the eye for the reason that for a number of years a quantity of chalk was spread on the surface during the winter for agricultural purposes. Such a soil is evidently well suited to the growth of Gooseberries. Our bushes have been planted eleven years, and during that time, they have only received manure three times, but they have never failed to give us a crop of fruit. I send you a small branch to show how heavily the trees are laden. Most of the varieties make but little growth now, and need but little pruning; indeed, some sorts grow so little that it is out of the question to think of getting from them suitable shoots for cuttings. Where the Gooseberry bushes make abundant growth and but little fruit, they should be transplanted. The bushes ought then to be pruned in such a manner that the main branches stand fairly wide apart, so that the wood may be matured. It is with the Gooseberry as with other fruit trees, if the current season's growth be not ripened, it is in vain that

FIG. 15.—LEAF OF *LELIA MAJALIS*, DAMAGED IN ONE NIGHT BY THE BEETLE, *EUNALCUS ALBO-COSTATUS*. (SEE P. 108.)

the grower expects a full crop of fruits. Gooseberries fruit well on spurs and the previous year's leading shoots. My aim in pruning is to establish bushes with several main branches, and having an open centre, so that ample sunlight can play amongst the branches, and until the bushes reach their full size, I allow all leading shoots to grow 1 foot long annually if they will do this, and obtain fruiting bushes quickly. If the main branches show signs of weakness, it is best to remove some of them each year, replacing them with young shoots; in this manner the vigour of the bushes gets renewed. When bushes are so established, and produce a full crop of fruit annually, it will be found that but little pruning is needed. We endeavour to do the pruning necessary before Christmas, as experience teaches me that there is no necessity to defer the operation till a later date. Pruning is done with a pair of hand-shears in preference to the knife, on the score of the work being much quicker done. I am an advocate of summer-pruning of bush-fruits, where growth is freely made, and the time can be found to do it; in fact, time ought to be always found for this job. The advantage of shortening the current growth from the middle

to the end of June is two-fold. First, the removal of such shoots that must of necessity come away at the winter pruning, and prevents crowding; moreover, the fruit colours and ripens better, and is rendered much cleaner by being exposed to rain. As previously noted, the fact whether Gooseberry trees require much or little pruning depends entirely upon circumstances, which can only be accurately judged on the spot, but where they are yearly fruitful, the work of pruning is considerably lessened by the crops borne, or ought to be if the bushes are rightly managed. *E. Molyneux.*

ON THE VARYING CHARACTER OF HYBRIDS.—A correspondent (p. 753, vol. ix.) inclines to the belief that one may foresee or predict, by employing certain combinations, the character of a proposed hybrid. The idea that hybrids are intermediate between two parents as regards their general features is a very common one. This sometimes results, but so far as my experience goes, it is the exception rather than the rule. *Diplacus aurantiacus* of gardens, came from one of my youthful crosses. This is intermediate between *D. punicus* and *D. glutinosus*, its parents. But the most interesting of my experiences has been the vast difference between the seedlings raised from a single flower. I believe I was the first to introduce the modern race of hybrid Fuchsias. *St. Clare* did not appear in the trade as soon as *Standishii* or *Dominiana*, because its propagators kept it on hand longer to raise stock, but my plants flowered the second year after the introduction of *Fuchsia fulgens*—the male parent. A garden form, known as *F. longiflora*, was the female. Only one flower was crossed, only one berry produced. I do not remember how many plants, but I believe several score, but no two plants were alike. A few were little different from the mother plant; the tendency was more in that direction than in the direction of *F. fulgens*. Since then I have succeeded in getting *Fuchsia arborescens* to seed with pollen from one of our garden varieties. Instead of there being any intermediate character, the progeny were exactly *arborescens*. I know some may say, "No doubt some error. Of course the flower, in some way, received its own pollen." I can only remark, that old fellows like ourselves cannot be caught in that way. But without going into a list of my experiences, I will tell of one before me now. Two years ago, I pollenised *Rosa kamtschatica* with our well-known garden form, *General Jacqueminot*. The sowing in the open ground from this one "haw," produced only two plants which have not yet flowered, but so far as appearances go, one plant is the "General," and the other, the original *Kamtschatica* Rose! There may be some differences in the flowers. I expect them, but certainly so far as the plants themselves got, there is nothing like the exact mixture of characters so often supposed from hybridisation. To my mind, this prevalent idea of an equal fusion of character in hybrids, does much harm to vegetable biology. It induces us to overlook the fact that plants possess the power to vary enormously, outside of any conditions of environment, that their characters would be constant and exact only for foreign pollen, or some other accident coming along to produce change. This innate power to change must, in the usual order of things, be under the operation of some law, but what that law is, no one has yet been able to get the slightest conception of. It does not help us in this investigation to assume that it is dependent on the chapter of accidents. We see, at any rate, by the results of this Rose experiment, that no accident of which we have at present any appreciation of, could have produced the results as stated. *Thomas Mehan, Germantown Nurseries, Philadelphia, U.S.A., July 6, 1891.*

"ENGLISH WONDER" PEA—In the *Gardeners' Chronicle* of Saturday last, you notice a sample of this new Pea, sent to you by Messrs. Cannell and Sons, and many of your readers may like to know its origio. It was raised by a Mr. Tipping, an old gardener at Kenilworth, who, for several years past, has paid attention to the hybridisation of Peas, and raised, amongst others, "Early Bird" and "William the Conqueror," and this dwarf Pea, "English Wonder," and they have been, and still are, extensively grown for seed by Mr. Burbury, seed grower and farmer, Kenilworth. I saw in the gardens at Stoneleigh Abbey, the three sorts I have named growing there; and "William the Conqueror" and "William the First," side by side, bore a close resemblance, but the former is an excellent cropper. Mr. Biddard, gardener at Stoneleigh, thinks highly of "English Wonder." I have seen it growing in

other places, and Mr. Burbury sent to the Kenilworth Show samples of pods and haulm in the bearing state. It is a Pea of excellent flavour, dwarf, and a good cropper, and very early. Mr. Tipping is still at work with the crossing of Peas; but we are now so rich in first-class varieties, that only something with very superior all-round qualities should be introduced. *H. D.*

RASPBERRIES.—Of the many varieties of Raspberries, Superlative will, I feel sure, as it becomes known, take the leading position, as it is a great bearer, the fruits very large, compared with that of some others of good flavour. We have it growing side by side with Hornet, Baumforth's Seedling, and Fastolf, and they cannot be compared with it; and this may readily be seen without a very close inspection, the big conical fruits standing up boldly from the stout much-branched canes. So convinced am I of its superiority, that I am saving every sucker that pushes up from the shoots; and I would discard most of the other sorts, but that Fastolf is earlier than it, and I must keep it on that account. As yet, Superlative seems very scarce, as last year I ordered 100, and could only get supplied with half that quantity, and it is hardly likely that nurserymen have much stock of it as yet. Those who get it should plant at least 4 feet apart, as it is a strong grower, the canes running to a good height, being very stout and stiff, which is also much in favour of the variety, stakes hardly being required, for if the three or four canes, usually left to each stool or crown, are brought together and tied at the top, they stand almost rigid against the wind. As soon as all the fruit is picked, the old canes should be cut out. Raspberries should never be dug amongst, as by doing so the roots are disturbed, but a good top-dressing of rotted dung should be afforded them every winter, leaving it as a mulching. *J. Sheppard.*

DELPHINIUMS.—We forward you a few pips of some novel crosses of the Delphinium, gathered from flower-spikes 3 feet 6 inches in length, independently of the leafy portion; each spike attended with three or four surrounding branches or spikelets, if you can call that a spikelet which is 2 feet long. Viewed in this way, plants about 5 or 6 feet high make a noble backing to a border, and bloom throughout the summer and into the autumn. Wonder does not belie its name, with its swarm of bees instead of a single bee in its centre. King of Delphiniums, too, is royal in size, if not also in colouring. *Kelway & Son.* [Unfortunately, the bloom had resolved themselves into their elements when we examined them, but the magnificent specimens exhibited by Messrs. Kelway at the shows of the Royal Horticultural Society amply bear out their statement. *Ed.*]

LABELS.—The mention of the label question in No. 237 of the *Gardeners' Chronicle* induces me to tell you of my method for the alpine garden, where certainly conspicuous labels do not look well. I employ pieces of broken bottles of a dark colour, write the name thereon with a good deep-scratching diamond, and varnish over with a white, thick oil-colour. This remains in the scratched name when the oil-colour is rubbed off the surface. These labels are not stuck in the ground, but placed near the plants and they are very durable. *O. F., Lehenhof.*

CHRYSANTHEMUMS SHOWING FOR BLOOM.—Would some of the readers of the *Gardeners' Chronicle* who are Chrysanthemum growers, kindly say if it is a usual thing for "crown buds" to be showing so early as July, as a great many are doing here, viz., Mrs. Wright, Beverley, Val d'Andorre, Comte de Germiny, Grandiflorum, Belle Paule, G. Glenny, Refulgence, &c., and I fear that many more will show before long. The cuttings were put in during the last week in November and the first week in December, and received cool treatment, frost only just being excluded. If they are run on to the terminal bud, would they be good enough for exhibition? I would also be glad of a remedy for thrips, [Tobacco fumigation, or pyrethrum powder. *Ed.*] which have been and are still very troublesome. *Young Gardener.*

SOCIETIES.

ROYAL HORTICULTURAL.

CARNATION AND PICOTEÉ CONFERENCE.

On the occasion of the Chiswick Conference in July last year, a sub-committee selected from the Floral Committee examined the collection of border

Pinks growing in the garden, and awarded three marks (xxx) to each of the following varieties:—Her Majesty (Hooper), Beauty of Bath (Hooper), Modesty (Turner), Hattie Dean (Dean), Charmer (Dean), Mrs. Dark (Dean).

The Fruit and Vegetable Committee, P. C. M. Veitch, Esq., in the chair; and Messrs. J. H. Veitch, Denning, Bates, Reynolds, Wythes, Hudson, Crowley, Dean, Balderson, and Cheal, examined the collection of Peas growing in the garden, and awarded three marks (xxx) to the following sorts:—Ameer (Harrison & Sons), Early Green Marrow, Sutton's Empress of India (Sutton & Sons); Early Green Wrinkled.

This Committee met again on 14th inst. Present:—W. Warren, Esq., in the chair; Messrs. Dean, Woodward, Wythes, Reynolds, Smith, Hudson, and Denning, when three marks (xxx) were awarded to the following varieties of Peas, as representing the best types in the collection:—Duke of Albany (Veitch), tall Green Marrow; Telephone (Veitch), tall Green Marrow; Cheltenham (Veitch), tall Green Marrow; Extra Dwarf Daisy (Carter & Co.), Green Marrow; Critic (Eckford), tall; Essential (Eckford), tall; Epicure (Eckford), tall; The Echo (Eckford), dwarf; Alderman (Laxton), tall; The Marquis (Laxton), tall.

Two marks (xx) were awarded to the following varieties:—Sutton's Early Marrowfat (Sutton & Sons), dwarf; Optimum (Laxton), tall.

A 1st class certificate was awarded to Potato Early Short Top, provisionally named (Laxton), a remarkably fine and early variety. Tubers large, fully-grown—greatly in advance of any other variety.

TUESDAY, July 21.—The show of the National Carnation and Picoteé Society, and the meeting of the Royal Horticultural Society's committees, which were held together in the Drill Hall, James Street, Westminster, made a very gay and attractive whole, and the attendance of the public was fairly good.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. B. Wynne, W. Goldring, H. Herbst, J. B. May, F. Ross, G. Phippen, C. E. Pearson, W. Bennett, T. W. Girdlestone, H. Turner, C. Noble, R. Dean, Dr. M. T. Masters, C. Bryccsson, P. Paul, J. Fraser, and J. Laing.

From the nurseries of Messrs. Laing and Mather, Kelso, came some fairly fine blooms of a fixed sport of Carnation Souvenir de la Malmaison, named Lady Middleton; the ground colour of which is that of the older pink form (also shown in quantity), of this variety with crimson stripes; Madame Arthur Waroche is a bright red flower, a seedling of Belgian origin, also from Souvenir de la Malmaison Carnation. Two dozen fine blooms of the original Carnation Souvenir de la Malmaison were shown, with flowers not so monstrously overgrown as we sometimes observe them.

A very beautiful lot of stands of cut-flowers of Carnations and Picotees was put up by Messrs. J. Veitch & Sons, Chelsea. The flowers were, perhaps, of less substance and size than we have seen them in other years, but in the purity of their colours and regularity of outlines, there was nothing left to desire. A few of the best flowers may be mentioned—Self: Lothian, pink; Silver King, cerise; Florian, buff; Brilliant, lake; W. P. Midner, Comte de Chambord, both white; Royal Purple, purple; Masterpiece, carnation-red; The Cropper, brilliant scarlet; Beauty of Foxhall, rich purple; Magnum Bonum, scarlet; Reynolds Hole, salmon-pink. Flakes and bizarres: Miss Crombie, yellow, flaked crimson; Colmont Beauty, pale buff and purple-rose; R. Jefferies, yellow and crimson; Mrs. Thomas, Thalia, Joe Baystock, &c. Among the border Carnations shown in this collection were Border Maid, rose-self, running out at the margin into white; and the Crimson Clove.

A large collection of flowers of hardy perennials in variety was staged by Messrs. Paul and Son, Old Nurseries, Chesham. This included seven boxes of cut roses in fine condition and rich variety. Rarer plants observed were *Rudbeckia californica*, a flower having large yellow rays, and conical green disc—a strong grower; (*Euthera speciosa*, white; *E. Youngi*, deep yellow, a fine plant for borders; *Disa grandiflora*, *Potentilla formosa*, with rose-red flowers; *Canna Francis Corbin*, yellow ground, spotted with scarlet; *C. Hippolyte Flandrin*, orange-red; *Anton Chantin*, yellow, sparsely spotted with red; *C. Wilhelm Piltzer*, bright crimson; *C. Madame Crozy*, crimson, with a bright yellow edge; and *C. Fran-*

cisque Morel, a deep red, very dwarf in habit, and of telling shade; *Babiana rubro-cyanea*; many species of Lilies, *Brodiaea Murrayana*, *Vallota purpurea eximeia*, and the pretty pink-flowered *Pentstemon barbata*.

Some excellent Verbenas, as cut blooms, were staged by Mr. W. Stacey, florist, Dunmow. There was great choice of colour, and the trusses were of good size. It is a pity these pretty plants are not more employed in beds and borders, and as greenhouse plants for early summer use.

Hardy flowers came in great profusion from the nurseries of Messrs. J. Laing & Son, Forest Hill, S.E. There were *Alströmérias*, white *Antirrhinums*, Carnations, *Anthemis nobilis*, yellow rays and orange disc; *Gaillardia grandiflora*, *Violas*, *Gladiolus ramosus*, several *Calochortus*, *Centaurea macrocephala*, &c.

Some nice boxes of nice Rose blooms were shown by Mr. W. Rumsey, Waltham Cross; and a semi-double pink flowered ivy-leaf *P. largonium*, Beauty of Castle Hill, was shown by Mr. R. Owen, florist, Maidenhead. It was dwarf in habit, and free-flowering.

Messrs. W. Paul & Son, Waltham Cross, showed their Tea Rose, Corinna, a pretty pinkish-buff with a filbert-shaped bud; H. P. Spenser, a beautiful Rose, full of a flesh-pink colour; and Mrs. Paul, a nice bouquet Rose, of a small size, and pale blush in colour.

One of the best, if not the best, collections of self-coloured Sweet Peas we have ever noticed was that shown by Mr. Eckford, Wem, Salop. Of these we may name the following colours:—dark purple, light purple, rose-blush, crimson, pale pink, pale yellow. Variegated flowers of a good type were also found in the collection, but the selfs were very choice and true.

Messrs. Kelway & Sons, Langport, Somerset, showed a very extensive collection of perennial *Gaillardias*, the newest being Buffalo Bill, in naming which they have come out of the mists of antiquity to contemporary persons. It has fluted forets of a yellow colour, and, like all these *Gaillardia grandiflora*, it will come true from seed.

A number of Delphiniums were shown, amongst them, D. Zahl, a species with a flower of the colour of the Evening Primrose. Some compact-growing double-flowered varieties were observed in Langport Gem and Henry Drummond. Amongst their miscellaneous plants may be mentioned *Centaurea Tourneforti*, yellow; *Cephalaria speciosa*, creamy white, globular heads of flowers; and *Telekia speciosa*.

From Mr. Bateman's garden at Worthing, came a fine spike of *Phormium tenax*, New Zealand Flax, which shows that whatever may have been the severity of the winter near London, it was materially better on the south coast.

One of the most interesting exhibits consisted of a series of cut specimens illustrative of the more decorative kinds of deciduous trees and shrubs, forming an object lesson which greatly needs enforcing. Amongst the deep purple-leaved plants none is deeper than the purple Nut; *Amygdalus dulcis purpureus* may also be mentioned, together with *Berberis vulgaris purpureus*, and *Prunus Pissardi*, the yellow flowers of *Berberis aristata*, thrown up by a background of these purple leaves, was very effective. *Acer latum*, alias *colchicum rubrum*, *A. palmatum atropurpureum*, and others furnish various shades of purple and red. Amongst the yellow-leaved series, nothing finer than the golden Catalpa can be seen, and associated with it may be mentioned the Golden Elder, the Golden Oak, "Concordia," various Privets, such as *ovalifolium var. elegantissimum*; Maples, Cornels, and *Weigela Loomaui aurea*. The noble foliage of *Quercus daimio* was especially conspicuous amongst the green-leaved set in strange contrast with the finely-cut leaves of *O. filicifolia*. *Stephanandra flexuosa*, various Maples, and others "too numerous to mention," went to make up a very interesting group. Intermixed with these were cut specimens of various flowering shrubs, such as *Spiraea canescens*, *Weigela sessilifolia*, a yellow-flowered species, new to us, and one that is interesting, and, perhaps, susceptible of improvement; at present the colour is like that of the corolla of *Lonicera Ledebouri*, a near neighbour of the *Weigela*. Specimens of *Ceanothus*—pink, white, blue, and cream-coloured; *Itea virginica*, *Carmichaelia*, and others, were effectively mixed in with the foliage. This group was exhibited by Messrs. Veitch & Sons.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. J. O'Brien, W. Courtauld, T. B. Hlaywood,

Maxwell T. Masters, H. Williams, J. Douglas, E. Hill, C. Pilcher, H. Ballantine, H. M. Pollett, A. H. Snee.

The Orchids shown, if not very numerous, were of a choice character. Foremost among them, we may note Mr. Hamar Bass's variety of *Cattleya Hardyana*. This was a gorgeous flower, of large size, with broad segments of a very deep rose or rosy-lilac colour, the fore part of the lip of the richest purple, while the orange-yellow throat was streaked with purple. No wonder the award of a First-Class Certificate was unanimous.

From the garden of the Marquis of Salisbury came a large number of cut spikes of *Saccolabium Blumei*, each of great length, and densely crowded with flowers; a Silver Flora Medal was awarded to the exhibit, which gave evidence of superior cultivation. Equally remarkable from the point of view of cultivation, if not more so, was the group of *Disa grandiflora* shown from Chatsworth, and to which a Silver Flora Medal was awarded. From the gardens of T. W. Temple, Esq., Tunbridge Wells, came a nice group of varieties of *Cattleya gigas* which won for the exhibitor a Silver Banksian Medal. Mr. Temple also showed a plant of a white variety of *Trichopilia tortilis*.

Messrs. Seeger & Tropp had a small group of white flowering Orchids, including *Dendrobium Dearei* and *D. lophophotum*, together with *Aerides maculosum*. C. G. Smith, Esq., Cobham, showed the old *Oncidium Lanceanum*. Mr. B. S. Williams brought an interesting group of Orchids, for which he obtained a Silver Flora Medal. Among the plants exhibited were some nice pieces of *Cypripedium Morganæ*, *C. selligerum rubrum*, *C. superbiens*, *C. tonsum*, *Chysis lavis*, the curious orange-flowered *Cochlidia Noezliana* (picked out for a Botanical Certificate), *Trichopilia Galeottiana*, the whole backed up by a fine lot of Vandas.

Fruit Committee.

Present: W. Warren, Esq., in the chair; and Messrs. A. Dean, G. Woodward, G. Wythes, G. Reynolds, J. Smith, J. Hudson, and W. Deuning.

A large collection of small fruits, valuable as an object-lesson to gardeners and amateurs alike, came from Messrs. J. Veitch & Sons, Chelsea. It consisted of about sixty dishes of Gooseberries, show and dessert varieties; a number of stems of the Gooseberry grown as upright cordons, these being loaded heavily with berries; some very fine examples of the best early Cherries, amongst them *Imperatrice Eugène*, Governor Wood, Black Eagle, Frogmore Early Bigarreau, Bigarreau Gros Rouge, Belle Magnifique, Belle d'Orleans, Mammoth, Elton, Nouvelle Royal. The collection of Raspberries was a small one, but it contained all or nearly all the varieties worth growing—we may name the conical-fruited, prolific *Superlative*, Carter's Prolific, and *Semper Fidelis*, fine for preserving; Carter's Keigbley Queen, *Magnum Bonum*, Northumberland Fullbasket, and *Yellow Antwerp*. About twenty varieties of Strawberries were shown, including *Helena Gloede*, *The Captain*, *Loxford Hall*, *J. Veitch*, and *Latest of All*. Some dishes of the best kinds of black, white, and red Currants completed the exhibit.

Messrs. T. F. Rivers & Son, Sawbridgeworth, Herts, had some superb dishes of Cherries—*Turkey Black Heart*, *Ludwig's Bigarreau*, *Olivet*, *Gémit d'Helldeluge*, *May Duke*, *Black Heart*, *Bigarreau Noir de Guben*, *D'Espagne*, *Bedford Prolific*, *Griotto Imperiale*, and *white Bigarreau*. Some few dishes were shown of early Peaches from the house, such as *Belle Beauce*, *Exquisite*, *Albatross*, and *Stump the World*; likewise a seedling *Nectarine* of good eating quality, which Mr. Rivers has not yet named. The *Curlew*, *River's Heron*, and *Early Transparent Gage Plums* are worthy of notice—the first two novelties of merit; the fruits came from an orchard-house.

Messrs. J. Carter & Co., High Holborn, exhibited, from their trial grounds at Perry Vale, S.E., a collection of eighty-seven dishes of almost as many varieties of garden Peas. A good many of these were of their own raising, as *Stratagem*, *Anticipator*, *Telegraph*, and its selection *Telephone*; *Elephant*, a fine straight pod, with nine peas therein; *Daisy*, a pea not yet sent out, a plant 2 feet high, with pods well filled.

Mr. W. A. Cook, gr. to Major Heneage, Compton Bassett, Wilts, exhibited eight dishes of various Peas, of which Sir F. R. Milbank and The Duchess were capital examples.

The Dowager Lady Freake, Fullwell Park, Twickenham, showed four dishes of excellent Peaches, *Grosse Mignonne*, Dr. Hogg, and received a cultural commendation.

The Forde Abbey Tomato, a bunch of ripe fruits weighing four pounds, was shown by Mr. Crook, gr., Forde Abbey, Chard, also a seedling Tomato, *Abbi-ana*, a smooth red variety.

Mr. Divers, gr. to J. T. Hopwood, Esq., Ketton Hall, Stamford, showed some very large fruits of *Peaches*, *Sea Eagle*, *Barrington*, *Royal George*, *Prince of Wales*, and *Princess of Wales*; also the *Nectarine Peach*. Most of these fruits were of high colour, if in some instances barely ripe.

Mr. H. A. Page, gr. to F. Crisp, Esq., White House, New Southgate, exhibited three massive bunches of *Canon Hall Muscat Grapes*, barely finished. *Fig. Ursule d'Avignon*, a small pale brown fruit that cracks when ripe; a new white *Currant*, *Pride of Aston*; and a dish of *Nectarines*. Lord Howard of Glossop (gr. Mr. R. Ashton), showed *Melons*; and from the Society's garden came sixteen dishes of *Currants*, red, brown, and white.

List of Awards.

ORCHID COMMITTEE.

Silver Flora Medal.

To B. S. Williams, Esq., for group of Orchids.
To Duke of Devonshire, for *Disa grandiflora*.
To Marquis of Salisbury, for *Saccolabium Blumei* (cut spikes).

Silver Banksian Medal.

To J. W. Temple, Esq., Tunbridge Wells, for *Cattleya gigas*, group.

First-class Certificate.

To Hamar Bass, Esq., Byrkley, for *Cattleya Hardyana* (Hamar Bass's var.).

Botanical Certificate.

To B. S. Williams, & Son, for *Cochlidia Noezliana*.

FLORAL COMMITTEE.

First-class Certificate.

To Allamanda Williamsii, from Messrs. B. S. Williams & Son.

Awards of Merit.

To Ivy-leaved *Pelargonium Beauty of Castle Hill*, from Mr. R. Owen.

To *Pteris serrulata pendula*, from Mr. F. Lane.

To *Rudbeckia californica*, from Messrs. Paul & Son.

To *Spiræa Beauty of Knapp Hill*, from Mr. A. Waterer.

To *Sweet Pea Lady Penzance*, from Mr. H. Eckford.

To *Sweet Pea Venus*, from Mr. H. Eckford.

To *Sweet Pea Mrs. Eckford*, from Mr. H. Eckford.

Botanical Certificate.

To *Delphinium Zaili* (species), Messrs. Kelway & Sons.

MEDALS.

Silver Flora.

To Messrs. Paul & Son, for Group of Roses, &c.

To Messrs. J. Veitch & Son, for Group of cut hardy foliage.

Silver Banksian.

To Messrs. Laing & Mather, for Collection of cut Carnations.

To Mr. W. Rumney, for Collection of cut Roses.

To Messrs. Kelway & Sons, for Collection of hardy flowers.

To Messrs. J. Laing & Sons, for Collection of hardy flowers.

To Mr. T. S. Ware, for Groups of Lilies.

To Mr. W. Stacey, for Collection of Verbenas.

Bronze Banksian.

To Messrs. J. Veitch & Sons, for Collection of Carnations and Picotees.

FRUIT COMMITTEE.

Silver Gilt Banksian Medal.

To Messrs. J. Veitch & Sons, Chelsea, for 250 dishes of fruit.

To Messrs. T. Rivers & Sons, for Peaches, Plums, &c.

Silver Banksian.

To W. H. Divers, Esq., Ketton Hall, Stamford for Peaches.

To James Carter, Esq., for Collection of Peas (180 vars.).

First-class Certificate.

To Seedling Strawberries, from Mr. W. Allan, gr. to Lord Sutherland, Gunton Park, Norwich.

At the close of the ordinary duties of the Fruit Committee, Mr. Rivers stated he had a resolution to propose bearing on the subject of fruit culture, which was now commanding attention. He said the Minister of Agriculture, in speaking at the Guild-

hall last week, did not appear to know the Royal Horticultural Society had a special committee of the most competent men, and he thought the Society ought to take a more prominent position, and lead the way instead of being left behind, as an authority on the subject of fruit, especially as they possessed such a great collection of trees and varieties in their gardens. Mr. Rivers concluded his remarks by proposing the following resolution:—

"That it is desirable that the Royal Horticultural Society, acting through its Fruit Committee, should endeavour to guide farmers and others, who are intending to plant, in the choice of the best and most profitable sorts of fruits, and that a leaflet should be prepared by the Committee with the necessary information, and that such leaflets be distributed by the Royal Horticultural Society in the widest possible manner."

Mr. J. Wright, in seconding the resolution, said he had sometimes thought the Council were waiting for some expression of the views of their Fruit Committee on this question. It was most desirable and appropriate that the Society should, as they could, give good advice to all who need it on the subject of useful fruit production, and he was sure the Council would give the best consideration to the resolution. Mr. Banyard and Mr. Crowley gave their strong approval to the object in view, and the resolution was passed unanimously, Dr. Hogg remarking he thought the committee had done a good day's work.

NATIONAL CARNATION AND PICOTEE SOCIETY, SOUTHERN SECTION.

Miscellaneous Self's and Fancies.—These, as is usual, made an effective display; some fine blooms were staged, and they attracted a good deal of attention. The best twenty-four blooms, in not less than twelve dissimilar varieties, came from Mr. C. Turner, who had *Alnra*, *Victory*, *Hutchinson's Rose* (self), Mrs. Reynolds Hole, *Annie Douglas*, Lord Rendlesham, Mrs. Maclaren (deep crimson self), *Ruby* (ruby self, very fine), *Charles Turner* (crimson self), *Fimbriata alba*, *Germania*, *Duchess of Fife* (soft pink), *Robert Hogg*, a rare form, &c. 2nd, Mr. F. Hooper, Bath, with Mrs. Little, *Squire Potts*, run; *Queen of Roses*, self; Mrs. Reynolds Hole, *White Queen*, *Alice*, flaked with pink; *Rosea perfecta*, self; Mrs. Laing, flaked with purple; *Pride of Penshurst*, *Ruth*, white self, &c. 3rd, Mr. J. Douglas, with some promising seedlings. 4th, Mr. T. H. Cattley.

The best twelve blooms, dissimilar, came from Mr. E. Rowan, who had fine blooms of *Purple Emperor*, *Comtesse de Paris*, Mrs. R. Hole, Vice-President, a rich crimson self; *Edith*, *Rose Celestial*, fine in colour; *President*, a bright purple self; *Middle Duttonche*, maroon self; Mrs. Ducroz, bright rose; and *Lady Agnes*, blush, striped and flaked with pink. 2nd, Mr. F. Nutt, with very good flowers, unnamed. 4th, Mr. G. Chaundy.

In the class for twelve plants in pots, there were two or three collections, but nothing worthy of special mention.

The premier Carnation was S.F. *Henry Cannell*, shown by Mr. J. J. Keen; and the premier Picotee, medium rose-edge *Madeline*, a beautiful flower, remarkable for its fine quality and purity.

First-class Certificates of Merit were awarded to Martin R. Smith, Esq., Hayes, for *Niphetos*, a beautiful white self Carnation of rare quality; and to a dull red self named *Gwendoline*, large, and having finely formed petals.

THE MIDLAND PINK SOCIETY.

JULY 14. — Our Wolverhampton friends undoubtedly scored on the occasion of the first exhibition of the Midland Section of the National Pink Society on July 14. They were admirably served in that they were able to hold it in connection with the Wolverhampton Floral Fête, and the fragrant Pink on one side of the flower-tent by no means ingloriously competed with the fragrant Rose on the other side, as both were in good form.

There were two competitors in the class for twelve Pinks in distinct varieties, Mr. M. Campbell, Florist, Blantyre, N.B., taking 1st prize with some good blooms for the season, of *Modesty*, *Boiard*, *Mary Anderson*, *Deuce*, *Lowlander*, *Emmeline*, *George Kennedy*, *Princess of Wales*, *Empress of India*, *Elizabeth*, *Samuel Barlow*, and *Sensation*. The 2nd prize was awarded to Mr. James Thurstan, Richmond Road, Cardiff, who had Mrs. Thurstan, Mrs. Morton, James Thurstan, John Dorington and George Hodgkinson, varieties of his own raising, and seedlings of considerable promise.

In the class for twelve blooms in not less than six varieties, Mr. A. R. Brown, Handsworth, Birmingham, was 1st with well laced blooms of Fred Hooper, Boiard, Zoe, Amy (very fine), Empress of India, Modesty, Rosy Morn, George White, and Victory, a few being in duplicate. 2nd, Mr. M. Campbell, having, distinct from the foregoing, Device, Emily, Emmeline, and Angus Paul. With six blooms distinct, Mr. A. R. Brown was again 1st, showing in good character, Rosy Morn, Amy, Boiard, Modesty, George White, and Empress of India. 2nd, Mr. C. F. Thurstan, Pennfields, Wolverhampton, with Device, Erudia, and Mrs. Thurstan differing from the foregoing. Mr. F. Morton, Merridale Grove, Wolverhampton, was 3rd. With six blooms in three varieties, Mr. A. R. Brown, who was in strong form, was again 1st, having Amy, Modesty, Eurydice, and Victory, two of them in duplicate. 2nd, Mr. C. F. Thurstan, with George Hodgkinson, Mrs. Thurstan, Modesty, and a seedling. Mr. F. Morton was 3rd. The best three blooms in distinct varieties came also from Mr. A. R. Brown, he had Amy, Modesty, and Rosy Morn. 2nd, Mr. C. F. Thurstan, with John Dorington, Boiard, and Mrs. Thurstan.

In the class for single blooms of purple-laced Pinks, Mr. Brown was 1st and 3rd, with Modesty; and Mr. Campbell 4th and 5th, with the same; Mr. C. F. Thurstan took the 2nd prize, with Mrs. Thurstan. In the class for red-laced, Mr. Brown was 1st and 2nd, with Empress of India; and Mr. C. F. Thurstan 3rd, 4th, and 5th, with seedlings.

The premier purple-laced Pink was Amy, shown by Mr. A. R. Brown, a good-sized full flower, with finely-formed petals, handsomely laced; also awarded a First-class Certificate of Merit; and the premier red-laced Empress of India, also from Mr. Brown.

The best six bunches of miscellaneous Pinks, eight blooms forming a bunch, came from Mr. C. H. Herbert (Messrs. Thomson & Son), Birmingham, a very interesting collection, consisting of Daniel O'Rourke, Ascot, Lord Lyon, Derby Day, Annie (deep pink, dark centre), and Mrs. Thomson, a small flower, laced with rosy-red. Messrs. Thomson & Son also had, not for competition, a stand of twenty-four bunches of Pinks, similar in the main to the varieties already named.

From Mr. Robert Sydenham, Birmingham, came a stand of very handsome laced Pinks, consisting of The Rector, in superb condition; Ne Plus Ultra, Minerva, Henry Hooper, Empress of India, and the new white variety, Mrs. Lakin. First-class Certificates of Merit were awarded to The Rector and Mrs. Lakin. A Certificate of Merit was awarded to Mr. Charles Turner, Royal Nursery, Slough, for a stand of blooms of The Rector, Lorina, Lustre, and Memnon, and unnamed seedlings, twenty-four blooms in all.

EALING HORTICULTURAL.

FAVoured by fine weather, and held in the beautiful grounds of Hanger Hill House, Ealing, by kind permission of E. M. Nelson, Esq., J.P., the twenty-seventh annual exhibition, held on 15th inst., was a decided success—horticulturally and financially—the arrangements reflecting much credit on the Hon. Secretaries, Messrs. Cannon and Dawes.

The competition is now confined to the district—a good horticultural one. In the class for a group of plants arranged for effect, Mr. H. Denison, gr. to T. A. Gledstanes, Esq., Old Manor House, gained 1st honours for a light and graceful arrangement; 2nd, C. Long, gr. to E. P. Oakshott, Esq.; 3rd, Mr. H. Viner, gr. to R. Dawes, Esq.

In the smaller class for a group for effect, the most successful competitors were Mr. J. Beasley, gr. to A. Fraser, Esq., and Mr. T. Wiseman, gr. to F. Butler, Esq. Fine foliage plants were very successfully shown by Mr. Wingrove, gr. to F. Hicks, Esq., and Mr. H. Viner. For the best specimen stove or greenhouse plant in bloom, the most successful competitor was Mr. C. Long. The Coleus from the latter exhibitor were very fine specimens. Grand Gloxinias, in rich variety and colour, were contributed by Mr. A. Jones, gr. to E. Hyde, Esq., and Mr. J. Beasley.

In the class for Caladiums, the post of honour was secured by Mr. H. Viner with some well-developed examples; and Miss Lilian Hudson, Gunnersbury, was invincible in the class for three stands or vases of flowers for the dinner table; 2nd, Mr. W. Merridew, gr. to F. Garlach, Esq.; 3rd, Mr. E. Chadwick, gr. to E. M. Nelson, Esq., the latter exhibiting successfully with bouquets and other cut flowers. Mrs. H. B. Smith, Court Florist, Broadway, Ealing, sent some very fine bouquets, in her usual

tasteful style, not for competition. Mr. Godfrey, manager to Mr. William Whiteley, Hillingdon, contributed cut blooms of Orchids—Cattleyas in good variety, and other choice things—which were much admired.

Fruit was not shown extensively, probably on account of the season. For four dishes, the premier award was assigned to Mr. S. Wingrove, gr. to F. Hicks, Esq., who had good Peaches, Melons, and Nectarines; equal 2nd, Mr. C. Edwards, gr. to W. Owen, Esq.; and Mr. H. Viner.

Some very good examples of Black Hamburgh and Muscat of Alexandria Grapes (not for competition) were staged by Mr. Thompson, gr. to Messrs. W. and E. Wells, Hattonhurst, Hounslow.

For a collection of vegetables (prizes offered by Messrs. Sutton & Sons), the successful competitors were Mr. S. Wingrove, Mr. C. Edwards, and Mr. E. Chadwick.

Some capital examples of Tomatos Hackwood Park and Westbourne Grove Favourite were staged (not for competition) by Mr. T. Godfrey, manager to Mr. W. Whiteley. The cottagers made a good and extensive display of vegetables, &c.

Some very beautiful and tasteful groups of plants (not for competition) adding much to the beauty of the show, were contributed by Mr. G. Reynolds, The Gardens, Gunnersbury Park; Messrs. Fromow & Sons, Chiswick; Messrs. C. Lee & Son, Hammer-smith, the latter showing, in addition, a fine selection of cut Roses and hardy herbaceous flowers; Mr. G. Weeden, St. John's Nursery, Ealing; and Mr. Holden, Park Road, Acton.

HIGHGATE HORTICULTURAL SOCIETY.

JULY 16.—One of the prettiest, brightest, and best-managed of the suburban horticultural societies, is that held at Highgate, on this occasion in a portion of the grounds of Holly Lodge, the residence of Baroness Burdett-Coutts. Two tents took the exhibits, plants being a leading feature in one, and cut flowers and fruits in the other. A number of special prizes, given by leading supporters of the society, served to bring out interesting features; then the President, Mr. W. Burdett-Coutts, M.P., gave some for a group of flowering plants, which formed a good feature along the sides of the plant tent. Mr. J. Brooks, gr. to W. Reynolds, Esq., Highgate, was 1st, having a free arrangement—Fuchsias, Liliums (auratum and speciosum), Trachelium cœruleum and its white form; Hydrangea paniculata, Francos, Petunias, &c. Mr. A. Eason, gr. to B. Noakes, Esq., Highgate, was 2nd. The President offered prizes also for a group of miscellaneous plants—six pots of Mignonette, a stand of flowers for the table, pots of Musk, model garden, &c., some of which were competed for by cottagers and amateurs, who contributed some capital produce. Baroness Burdett-Coutts offered special prizes for a collection of hardy cut flowers, which was won by Mr. T. L. Turk, gr. to T. Boney, Esq., Highgate, who staged forty-eight bunches—a very good lot indeed. Mr. C. J. Wilkins, gr. to W. Smith, Esq., Muswell Hill, was 2nd; also, for a collection of hardy fruits, Mr. A. Page, gr. to A. Taylor, Esq., The Priory, New Southgate, who had sixteen dishes, comprising Cherries, Strawberries, Raspberries, Currants, &c. Mr. C. Shepherd, gr. to J. S. Duval, Esq., South Grove House, was 2nd, with the same number of dishes; also for a collection of wild flowers.

Mr. A. J. Reynolds' special prizes for twelve tuberous-rooted Begonias brought some well-grown and flowered plants from Mr. C. Payne, gr. to C. J. Whittingham, Esq., Shepperd's Hill; Mr. G. Quelch took the 2nd prize. Mr. H. R. Williams offered prizes for a collection of hardy fruits, which also brought a good competition for such a late season; the 1st prize was won by C. Halsey, a cottager. Mr. F. Reckitt's special prize for six flowering plants brought a good competition; as also did his prizes for a collection of miscellaneous fruit. Mrs. Stedall's leading special prize for a group of plants was won by Mr. J. Brittain, gr. to C. J. Reckitt, Esq., Caen Wood Towers; Mr. Eason was 2nd. Mr. W. Scrymgeour's prizes for plants for table decoration, brought several competitors, and also for Gloxinias; some excellently grown and flowered plants were staged. Mr. W. Reynolds' special prizes for six stove and greenhouse plants brought a very good lot indeed from Mr. H. Eason, consisting of Eucharis amazonica, Gloriosa superba, Allamanda Hendersoni, &c. Mr. B. Noake's special prizes for six fine foliaged plants, brought a capital lot from Mr. Brittain, two

well-coloured Crotons, and two Dracœnas, being the leading subjects; and the special *Gardeners' Magazine* medal was awarded to this collection; Mr. H. Eason took the 2nd prize.

One novel feature appeared, through the special prizes offered by Mr. H. Regnart for twelve plants of Tuberous-rooted Begonias and twelve of Gloxinias. These, arranged on tables in four lines of six each, the Begonias at back and the Gloxinias in front, had an excellent effect. Mr. C. Payne was 1st, having the strongest Begonias and the weakest Gloxinias; Mr. H. Eason was 2nd, having very good Gloxinias, but a little weak in Begonias.

Major Walker's special prizes for six Coleus brought some good-sized pyramidal-trained plants, but rather small in foliage, from Mr. J. Brittain; Mr. Eason was 2nd, with smaller bush-shaped plants, of bolder growth. Mr. Wilkinson offered prizes for six plants in flower, as also did Mr. T. Boney, and brought well-grown and flowered subjects.

Mr. Eason had the best four Orchids, having Cattleya Gaskelliana, Cymbidium Lowii, Miltonia vexillaria, and Oncidium papilio; Mr. J. Brooks was 2nd, with three Cattleyas and Cypripedium Lawrenceanum.

Fuchsias were a good feature for the London district; Caladiums small, but well grown.

Exotic Ferns, in sixes, good. Petunias very good. The best specimen plant in flower was Clerodendron Balfourianum, from Mr. Eason; Mr. Brooks coming 2nd, with Allamanda. Fine plants of Latania borbonica and Seaforthia elegans divided the honours as foliaged plants.

Roses were shown in twelve varieties, three trusses of each, some very good flowers being shown by an exhibitor whose name did not transpire. Mr. S. Simpson's special prize for twelve varieties was taken by Mr. J. Bateman, Archway Road. The best twenty-four bunches of cut-flowers came from Mr. H. G. Russell, gr. to H. Mansfield, Esq., Highgate. Mr. H. Elcock had the best twelve bunches of tuberous-rooted Begonias arranged for effect.

The better class of fruit, such as Grapes, &c., was poorly represented. The best two dishes of Strawberries were Sir C. Napier and President, from Mr. H. G. Russell.

Vegetables were numerous, and on the whole, very good. Mr. C. Gregory had the best three dishes of Peas—Telegraph, Duke of Albany, and Telephone.

The 1st prize for an arrangement of three pieces for the dinner-table went to the Secretary, Mr. D. B. Crane, for a very artistic design in Iceland Poppies, Ferns, and Grasses, that was greatly admired.

WOODFORD HORTICULTURAL EXHIBITION.

THE nineteenth annual exhibition of the Woodford Horticultural Society was held on Thursday, July 16, in the pretty grounds of Mrs. Spicer, "Harts," Woodford Green. The entries were more numerous than last year, and the exhibits were staged in two marquees, one devoted to cut flowers and table decorations, the other to specimen plants, fruit and vegetables. There was a large attendance of visitors.

The fruit shown was fairly good. There were sixteen entries in the Grape classes. Strawberries were not well represented. Currants were very fine. Vegetables were very good, and some first-class Tomatos and Cucumbers were shown. As usual, the stove and greenhouse plants and Ferns were deserving of great merit, and were a leading feature. In the cut-flower department, the table decorations and bouquets were very pretty. Messrs. W. Paul & Son and Mr. W. Rumsey, of Waltham Cross, contributed a magnificent display of Roses, the latter having a box of a new Noisette named Nois l'Idéale, worthy of special notice. Messrs. Paul & Son, of Cheshunt, exhibited hardy herbaceous cut-blooms, and several baskets of Strawberries containing splendid specimens of fruit, amongst which newer kinds worthy of note were Noble, Latest of All, Auguste Nicaise, and La Grosse Sucrée.

ROYAL WESTERN HORTICULTURAL.

JULY 21.—After a lapse of seven years, this society has this year been re-started under entirely new management, and a schedule was issued consisting of about 172 classes, and a liberal response was made in the shape of subscriptions. A great feature, and one which helped the Society much, was the opening of the exhibition by the Duke and Duchess of Edinburgh, who afterwards inspected the various exhibits. Mr. Sandford, Junr., of the firm of Curtis, Sandford

& Co., presented the Duchess with a handsome bouquet made of Duke of Edinburgh Roses.

The nurserymen of the neighbourhood came out well, and did much to make the exhibition a success.

Messrs. Veitch & Sons, Royal Nurseries, Exeter, showed a group, about 40 feet by 7 feet, the centre of which was occupied by various Bamboos, Palms, and Japanese Maples, relieved by *Lilium auratum*, *L. Brownei*, *L. Harrissi*, &c. The group included a group of fine Carnations of the variety *La Grande*, *Lady Middleton*, *Rose Malmaison*, *Germania*, &c., with Carnations, as cut flowers, in the front, consisting of many new and choice varieties. Other flowers noticed were pans of *Drosera capensis*, *Dionaea Muscipula* and *Sarracenia chelsoni* and *exoniensis*, which were much admired; a handsome plant of *Blandfordiana nobilis*, boxes of *Roses*, *Asparagus scandens reflexus*, and a fine flowering spike of *Morina longifolia*. Very fine plants of *Gloxinias* were a feature of the group, also tuberous *Begonias*, in great variety, and *Orchids* in variety.

Mr. Smale, nurseryman, Torquay, staged a large group, principally of cut flowers, of hardy perennials, *Roses* in variety, *Dahlias*, zonal and Ivy-leaved *Pelargoniums*, which were backed up by *Palms*, *Crotons*, *Ferns*, *Caladiums*, *Fuchsias*, *Eulalias*, &c., making a very attractive whole. Messrs. Mill & Tweedie, Truro, exhibited a large collection of cut flowers of Pearson's new single and double-flowered Ivy-leaved *Pelargoniums*, *Roses* in variety, *Carnations*, hardy perennials, and a variety of *Shirley Poppies*, &c. Messrs. Curtis, Sandford & Co., Torquay, staged a magnificent lot of *Roses*, and especially even in size, and in boxes, of *Duke of Edinburgh*, *Merveille de Lyon*, *Baronesse de Rothschild* and *La France*; good blooms of *H.P.'s* were observed in *Marie Baumann*, *Etienne Levet*, *Charles Lefebvre*, *A. Colomb*, *Ulrich Brunner*, *Prince Arthur*, *Duchess de Moroy*, and *Victor Verdier*. *Cactus Dahlias* in variety were likewise shown by them. Messrs. Smith & Sons, St. Austell, staged a grand collection of cut blooms of double-flowered *Tuberous Begonias* in every shade of colour, the salmon-coloured *Henry Brown* being especially good. Mr. J. R. Williams, Compton Nurseries, Plymouth, staged a large collection of decorative plants in great variety. Mr. Chalice, nurseryman, Plympton, staged a beautiful collection of well-grown *Palms*, *Fuchsias*, zonal *Pelargoniums*, *Begonias*, *Orchids*, *Hydrangeas*, *Petunias*, *Anthuriums*, &c., very effectively arranged. Messrs. Hendre & Sons, Plymouth, put up a fine collection of plants, including many fine *Petunias*, as well as fine assortment of cut blooms of their handsome single and double fringed *Petunias*, *Carnations*, &c.

Groups of flowering and foliaged plants, not exceeding thirty plants, 1st, Mr. Chalice, with a group, which consisted of *Lilium longiflorum* *Harrisi*, *Carnations*, *Palms*, *Dracaenas*, *Nepenthes*, *Caladiums*, &c.; 2nd, Mr. Truscott. Mr. F. Clatworthy, gr. to F. Bradshaw, Esq., was 1st for six *Coxcombs*; and Mr. J. Pengelly, gr. to W. Square, Esq., was 2nd. Mr. Chalice was 1st for six plants for dinner-table decorations, and Mr. J. Pengelly was 2nd.

Fruit.—Mr. W. A. Cox was 1st for white *Grapes* and Mr. Truscott for black ones. Mr. Cox was 1st for twelve *Peaches*, showing *Corytoni*, a variety raised at Powderham Castle—some very fine well-coloured fruits; 2nd, Mr. R. Pond, with excellent fruits. For twelve *Nectarines*, Mr. T. Marsh, gr. to Sir F. Freake, Bart., was 1st, for *Lord Napier*—very fine fruits; 2nd, Mr. Cox. Mr. Marsh won with *Melon Hero* of Lockinge.

Miscellaneous.—The best dinner-table decoration was that of Miss Scaife, with Mr. Cole as 2nd. Cut flowers were shown in excellent taste by Mr. Pound; *Carnations* by Rev. D. Jenkins, who also took honours for twelve varieties of *Roses*; Mr. Cox being 2nd, who was also 1st for six *Orchids*.

Vegetables were shown in abundance, and were of good quality generally. For twelve dishes, Mr. F. Catworthy was 1st, with *Walcheren Cauliflower*, *Moore's Cream Marrow*, *Lettuce Veitch Perfect Gem*, *Duchess Peas*, *Telegraph Cucumber*, *Bunyard's Extra Long Pod Peas*, *Tomato Glenhurst Favourite*, *Veitch's Purple Shallot*, *Nonpareil Cabbage*, *Wright's Gem White Celery*, and *Devill's Extra Scarlet Horn Carrot*; 2nd, Mr. W. Jenkins.

Cottagers' Section.—Some excellent exhibits were shown in these classes, and the competition was severe.

PRESCOT HORTICULTURAL.

FAVoured with fine weather on the 16th inst. the seventh annual exhibition in connection with the Prescott and District Horticultural Society was

eminently successful. The show was held in a field at Park Side, lent for the occasion by Mr. James Whittaker, sen. The principal exhibits numbered over 700, an increase of 100. The prizes offered amounted to £120 in value, against £90 last year. The principal prize-winners were Mr. Edward Banner, Roby (gr., Mr. R. Pinnington); Mrs. Baxter, Rainhill (gr., Mr. E. Blayhen); Mr. E. C. Levington, Huyton (gr., Mr. H. McFall); Alderman C. J. Bishop, St. Helens (gr., Mr. E. Gray); Mr. G. G. Musson (Prescot); Mr. T. Harding, Roby (gr., Mr. William Learman); Colonel R. Pilkington, Rainford (gr., Mr. George Middleton); Mr. J. E. Brown, Huyton (gr., Mr. Joseph Watkin); Mrs. H. S. Hall, St. Helens (gr., Mr. John Price); Mr. A. L. Jones, Huyton (gr., Mr. John Bounds); Mr. John Parrington, Roby (gr., Mr. Thomas Heaton); Mr. John Beesley (Prescot), Mr. John Pownall (Prescot), Mr. W. H. Evans, Huyton (gr., Mr. James Mather), Mr. Charles Lockett (Prescot), Mr. John Lyon (Rainhill), Mr. John Pendleton (Prescot), and Mr. N. Mercer. Special prizes for the best *Roses* in the collection were won by Mr. John Beesley (open class) and Mr. N. Mercer (cottagers' class).

MANCHESTER ROSE SHOW.

JULY 18.—The Rose show held in the Royal Botanic Gardens brought out some of the best exhibitors in the trade and amongst amateurs. The season being backward in the north, the southern growers took the lead, and not a single northern exhibitor was able to take a 1st place. The *Roses* were a little over-blown, owing to the heat and the long distances some of them had travelled. The setting of good blooms enhances the appearance of boxes of cut flowers, which is more or less remembered by exhibitors, and the *Tree Ferns* and *Palms* and ground-work of lesser plants in the show area helped in a capital manner.

Taking the trade first, undoubtedly Mr. F. Cant, of Colchester, carried off the three best prizes. The trebles in thirty-six and in twenty-four varieties, were superb; and although the English Fruit and Rose Co., Hereford, beat him with "seventy-two distinct singles," they had not the quality of blooms, and generally speaking, they carried the day by their blooms being in a better condition than his.

The English Fruit and Rose Company had some excellent blooms, although not quite so large, full, and well staged. Mr. W. H. Merryweather showed an excellent assortment, and so did Paul & Sons, Dicksons of Chester, and Mr. George Prince, Oxford; the latter grower had a beautiful lot of *Tea Roses*, comprising the *Hon. Edith Giffard*, *Souvenir d'Elise*, *Innocente Pirola*, a fine large-petalled white, and several others. Mr. Cant had the best *Teas* and *Noisettes*. Most of the exhibitors named above had capital stands of twelve singles of one variety, of which *Her Majesty*, *Merveille de Lyon*, and *Mrs. J. Laing*, were the finer.

Messrs. Perkins & Sons, Coventry, had a creditable lot of *Roses*, and although he was defeated by Mr. Mason, a local exhibitor, in bouquets of *Roses*, they showed with style and spirit. Dickson & Robinson, and Dickson, Brown & Tait, of Manchester, had a great variety of cut blooms of various *Roses*.

The amateurs, although not so weighty, had on the whole some very fine flowers. They did not differ in sorts essentially from those named in the above classes. The 1st prize for thirty-six singles was awarded to Rev. J. H. Pemberton, Essex; Mr. S. F. Budd, Mr. J. B. Lindsett, Hitchin, and Rev. Foster Melliar following in the order named. Among the best *Roses* were *Marie Finger*, *Gabrielle Luizete*, *Her Majesty*, *Madame Lambert*, *Annie Rivers*, *Star of Waltham*, and *Abel Carriere*. Mr. Pemberton also took 1st position in trebles. Mr. Budd and Mr. Foster Melliar also had fine stands.

In *Tea Roses*, Rev. W. Burnside took leading position, Mr. S. F. Budd also showing well. Among the novelties in colour was *Marie Van Houtte*, with fine shell petal of a light colour dashed with yoke of egg colour at the base.

Miscellaneous.—Messrs. Clibran & Son, Altrincham, had a nice assortment of herbaceous and alpine flowers. Mr. M. Campbell, High Blantyre, sent a very creditable display of fancy *Pansies* in fine sorts, only the hot weather had curled up the blooms. Messrs. Dobbie & Co., Rothesay, N.B., sent also a fine collection, chiefly of *Violas*, and some of the best strains of *Sweet Williams* we have seen for years. A rather pretty novelty was sent by Mr. John Walkden, Sale, in the shape of a *Heliotrope-scented Pink* bearing

the name of *Souvenir de Sale*. It will make a pretty border flower, being of pale pink, with white centre, rather full, and of the odour of the *Heliotrope*. There were several other good exhibits.

One of the unique exhibits, which not only deserved the Gold Medal of the society but the Lindley Medal for superlative cultivation, was the collection of *Disa grandiflora* sent from Chatsworth. The plants numbered sixty-nine, and we venture to say, without fear of contradiction, that no such group of plants has been exhibited before. The total number of racemes was one hundred and eighty-eight, each with four flowers.

The Pink Show.—This was a comparatively limited exhibition. If the weather was cold for the unfolding of the *Roses*, so it was even in a more marked degree for the *Pinks*. Nothing could be finer than the 1st prize group, they were large and finely coloured. Among the best flowers were *Amy*, *Minerva*, *Ethel*, *Maud*, *Modestie*, *Boiard* (a grand flower), *Mrs. Barlow*, *Mr. Barlow*, and a lot of seedlings which, doubtless, will have their respective pedigrees, but they did not appear on the cards. The two that were singled out on this occasion were a deep red-blotched flower named *Bertha*, and a light red-blotched one named *Jas. Percival*. Even judges and the disappointed competitors should not forget being "hailed over the coals" about not giving a seedling a certificate, and that "a chief's among them takin notes." On being asked for a certificate, the judge said, "It will be a flower some day, it wants clipping."

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 12° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS. Above (+) or below (-) the Mean for the week ending July 18.	TEMPERATURE.		RAINFALL.		BRIGHT SUN.	
	Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths.	Ins.

12 1 + 137 0	- 3 + 40 3	- 89	12.8	61	48	

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. *Principal Grazing, &c., Districts*—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 18, is furnished from the Meteorological Office:—

"The weather remained fair and dry generally until towards the end of the week, when it became showery and unsettled, with local thunderstorms.

"The temperature has just equalled the mean in 'England, E.' and 'S.' but in all other districts it has been 1° or 2° above. The highest of the maxima were registered on the 17th, when the thermometer rose to between 79° and 82° over the greater part of England, and to between 73° and 78° in the western

and northern parts of the kingdom. The lowest of the minima, which were recorded on rather irregular dates, ranged from 40° in 'Scotland, N.,' and 41° in the 'Midland Counties' to 47° in 'England, N.W.,' and the 'Channel Islands.'

"The rainfall has been a little more than the mean in 'Scotland, E.,' and equal to it in 'England, N.E.;" in nearly all other districts, however, a decided deficit is shown.

"Bright sunshine has exceeded the mean in all except the eastern and the north-eastern parts of the kingdom. The percentage of the possible amount of duration ranged from 61 in 'England, S.W.,' and the 'Channel Islands,' and from 59° in 'Ireland, N.,' to 21° in 'England, N.E.'"

MARKETS.

COVENT GARDEN, July 23.

A brisk trade doing in Currants and Raspberries, with supplies good. Cherries and other goods, slow trade. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns s.d., s.d., s.d., s.d. listing prices for Apples, Lemons, Melons, Peaches, Pine-apples, Strawberries, etc.

NOTE.—Bananas and Apricots differ in price so greatly, according to quality and quantity on sale, that no trustworthy quotations can be afforded.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns s.d., s.d., s.d., s.d. listing prices for Arum Lilies, Asters, Carnations, etc.

ORCHID-BLOOM IN VARIETY.

POTATOS.—Home-grown from all the districts surrounding London, are coming to hand in fairly heavy quantities. Prices ruling from 5s. to 8s. per cwt. J. B. Thomas.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns s.d., s.d., s.d., s.d. listing prices for Artichokes, Beans, Beet, Carrots, Cauliflowers, etc.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns s.d., s.d., s.d., s.d. listing prices for Aralia Sieboldii, Aspidistra, Bedding plants, Bouvardia, etc.

SEEDS.

LONDON, July 22.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that business in seeds, as might be expected, is just now at a standstill.

FRUIT AND VEGETABLES.

SPITALFIELDS: July 21.—Quotations:—Cabbages, 2s. to 3s. per tally; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen; Peas, 1s. 6d. to 2s. 6d. per bushel; do., 2s. 3d. to 3s. 6l. per sack; Sea-kale, 1s. to 1s. 6d. per punnet; Vegetable Marrows, 3s. to 4s. per dozen; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, 1s. 6d. to 2s. do.; Parsley, 1s. 6d. to 2s. do.; frame Cucumbers, 1s. 9d. to 2s. 6d. per dozen; Horseradish, 12s. to 13s. per dozen bundles; Mint, 1s. 6d. to 2s. 6d.; spring Onions, 2s. 6d. to 5s. per dozen bunches; Cos Lettuce, 4l. to 8l. per score; Cabbage do., 4d. to 6d. per dozen; Endive, 1s. to 1s. 6d. do.; Gooseberries, 2s. 6d. to 4s. per half-sieve; black Currants, 7s. do.; white do., 5s. to 6s. do.; red do., 4s. to 5s. do.; black Cherries, 4s. 6d. to 6s. do.; white do., 7s. to 10s. do.; Raspberries, 30s. to 32s. per cwt.; Strawberries, 2s. to 3s. per peck.

STRATFORD: July 22.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 3s. 6d. per tally; Carrots, household, 1s. 6d. to 2s. 6l. per dozen bunches; cattle-feeding, 1s. to 1s. 3d. do.; Onions, Egyptians, 100s. to 110s. per ton; Green Peas, 1s. 6d. to 2s. 6d. per sieve; do., 2s. 3d. to 5s. per bag; black Currants, 6s. 6d. to 7s. per half-sieve; red do., 4s. to 5s. do.; white do., 4s. to 5s. 6d. do.; Gooseberries, 2s. 6d. to 4s. do.; do., 5s. to 7s. per flat; Strawberries, 2s. to 3s. per peck.

POTATOS.

BOROUGH: July 21.—Quotations:—Kent and Essex Hebrons, £7. to £5 10s.; Early Rose, £4 10s. to £5; kidneys, £3 to £7. Old; Miganms, £3 to £3 10s.; Jersey new, £7 to £7 10s.; Cherbourg flukes, £3; and rounds, £5 per ton.

STRATFORD: July 22.—Quotations:—Myatt's kidneys, 120s. to 140s.; Hebrons, 90s. to 110s.; Jersey flukes, 170s. to 180s.; foreign, Cherbourg, 140s. to 150s. per ton.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

Would any correspondent kindly inform "A. W." what proportion of carbonic acid to water should be used on the roots of Vines.

NOTICES TO CORRESPONDENTS.

CORRECTION.—Second Innings of the Gardeners' v. Scedsmen's Cricket Match in last issue, for "E. Cannell," read "C. C. Hurst."

CROP OF BLACK CURRANTS: A. W. The amount of fruit to be obtained would vary with circumstances, but a good crop on bushes of the size given would be about 1 gallon per bush. This season Black Currants suffered much from spring frosts.

GRAPES: J. K. The shanking is due to so many causes, that we cannot say which of them has caused it in your case. The commoner cause is a bad state of the roots, brought about by badly drained close pasty soil, this causing the loss of the finer roots—look to the border in early autumn. For red-spider you must sponge the leaves with soapy water. It is a tedious job, but effectual.

INSECTS: W. M. (Oakwood). The Rose-shoots are attacked by a small black-and-white saw-fly—Teluthredo cincta, of Linnaeus = Emphytus cinctus of modern writers (see figure and description in the Gardeners' Chronicle, 1856, p. 421), the larvæ of which burrow into the young shoots, eating the central pith, and making cylindrical gangways. Pick off and burn all the attacked shoots without delay. I. O. W.—J. P. The insect which has bored into your Apple tree is the caterpillar of a moth, Zenzera æxuli.

LEAF FROM CUCUMBER: J. B. We have frequently seen similar outgrowths.

NAME OF APPLE: W. J. F. We are unable to name the Apple sent.

NAMES OF PLANTS: I. O. W. Astrantia major. H. J. Ross, Davos Platz. Orchis ustula, O. militaris, Gymnadenia conopsea, R. Br.; Nigritella angustifolia, Rich.; N. suaveolens, a natural hybrid from the last two.—D. C. Crested Moss.—C. S. Ampelopsis. We cannot tell from the specimens sent.—J. R. W. 1, Acer palmatum; 2, Campanula—send better specimen; 3, Ginkgo adiantifolia (Maidenhair tree); 4, not recognised; 5, Ixora sp.; 6, Spiræa callosa; 7, Acer negundo variegatum.—Mrs. C. Lythrum hyssopifolium.—V. C. Galega officinalis, perfectly hardy. There is also a white variety.—R. H. 1, Alocasia hybrida;

2, Davallia (Leucostegia) immersa; 3, Dieffenbachia nobilis; 4, Nephrolepis tuberosa; 5, Nerium oleander flore-pleno, a good variety; 6, Begonia argentea. The numbers were all detached, consequently we can only guess at them.—W. D. H. Potentilla fruticosa.—J. M., Bath. Next week.—No name. 1c, Statice latifolia; 2c, Potentilla atro-sanguinea; 3c, Centaurea macrocephala; 4c, Telekia speciosissima; 5c, not recognised; 6c, Watsonia Meriana.—J. MeM. 1 and 2, species of Ornithogalum, which we cannot name; 3, Astrantia Biebersteinii, probably; 4, Erigeron speciosus; 5, Lysimachia thyriflora; 6, Mimulus cardinalis.—E. R. 1, (?); 2, Clarkia pulchella; 3, Malcolmia maritima; 4, Oxalis sp.; 5, Campanula sp.; 6, Cuphea platycentra. Specimens dried up when received.—A Constant Reader. 1, Blechnum occidentale; 2, Adiantum macrophyllum; 3, Polypodium appendiculatum; 4, Adiantum concinnum latum; 5, Pteris argyræa; 6, Asplenium Belangeri.—J. M. 1, Coronilla varia; 2, Anchlussa italica; 3, Sedum spurium; 4, Centaurea; 5, not recognised.

NURSERY LAND: A Young Nurseryman. Have nothing to do with it. Something much better suited for a nursery-ground may turn up. "Black loam" overlying blue clay does not seem to be very enticing.

PARSNIPS: George Thompson. We have sent off the Parsnips and insects to our referee, and will be able to give you a reply to your question next week.

PEAS: J. S. We have seen similar mossy outgrowths before. We suspect rather than know that they are caused by the irritation of a mite. There is no fungus.

PETUNIAS DYING-OFF: T. H., Devon. It is almost impossible to examine satisfactorily the Petunia foliage, on account of so much sand adhering, as to break all the cover glasses. I find nothing the matter with the roots, and no evidence of Peronospora. The dead tissue is full of mycelium, and on the dead leaves is plenty of Cladosporium, which is not the cause of the mischief, but comes after. I believe the true cause is a minute mould, coming on the spots of the leaves, and this belongs to the genus Ramularia, which is hitherto unknown. These moulds are so delicate that they do not bear carriage, and hence are so difficult to make out from rough material. Spotted and dead leaves should be sent flattened in folds of blotting paper, for further examination. This is an internal parasite, and nothing can save the plants. Every effort should be made to prevent it spreading. There are plenty of the spores about the dead leaves. M. C. Cooke.

SOCIETY: J. W. W. We know nothing about the society you mention, except that a similar application was made to us, which we disregarded.

TOMATO DISEASE: J. R. W. One of the fungus moulds affecting Tomatoes—we cannot tell which in the present state. It is too late to do anything now, otherwise you might have tried the copper solution.

VINES: Interested. The condition of your Vines is not unusual; the cause is not, however, so well understood. As you have observed, the berries are not set, and the silvery appearance they have is due to some constitutional weakness. There are some Vines at Chiswick similarly affected, one a golden Hambro is so every year.

VINES: Foreman. The roots are full of spawn mycelium—the cortex completely destroyed by it. Cannot say whether there is rotten wood or mycelium in the soil, or whence derived; but the cause of the mischief is the profuse spawn at the roots. Doubtless, all the surrounding soil will be pervaded by it, and no chance for the plants but by transfer to fresh clear soil, and then doubtful. M. C. Cooke.

CATALOGUES RECEIVED.

G. PHIPPEN, Reading, Berks—Bulbs and Roots.

COMMUNICATIONS RECEIVED.—J. Maltby.—R. A. R.—V. C.—F. B.—E. C.—E. H.—C. S., Guernsey (many thanks, we quite concur, but there are so many other considerations, and we shall revert to the subject later on).—W. E. G.—H. W. W.—D. F.—H. V.—E. H. B.—J. S.—E. F., Florence.—W. C. & Sons.—R. A. R.—Yes.—R. G. S.—R. B.—J. B.—J. S.—C. A. M. C.—R. B., Christchurch, New Zealand.—W. Sutherland.—W. D.—Campanula.—W. N.—Head Gardener.—H. G.—G. B. C.—J. K. & Son.—W. A. Carpenter, N. Z.—J. W.—R. D.—P. W.—J. O'N.—G. M. Wood, Natal, many thanks.—Foreman, next week.

S.C. CLAY'S INVIGORATOR

TRADE MARK.

FOR PLANTS. QUICK, LASTING, ECONOMICAL.

The Gardens, Seacroft Heath, Hawkhurst, Kent, March 11, 1891.
DEAR SIR—Having used your "Clay's Invigorator" for some time, I am exceedingly pleased with the results obtained from it. As an Exhibitor I have used it upon most sorts of Vegetables with great advantage; also upon many sorts of Stove and Greenhouse Plants—Melons, Cucumbers, Tomatoes, Pot Strawberries, Chrysanthemums, &c. For Lawns it has a quick and beneficial effect. For Amateurs and those with small gardens, where there is a difficulty in obtaining stable or farm-yard manure, your "Invigorator" ought to be of special value, as it is clean in use, easy of application, and reasonable in price.—Yours respectfully, J. GILMOUR, Gardener to the Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the Works, in 6d. and 1s. Packs, and SEALED BAGS:—
7 lbs. 14 lbs. 28 lbs. 55 lbs. 112 lbs.

2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.
The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of ONE SHILLING by the MANUFACTURER—
S. C. CLAY,
Marsh Island, Stratford New Town, London, E.
NO CONNECTION with ANY OTHER FIRM

TO NURSERYMEN AND AMATEUR GARDENERS.

CRUSTACEAN FERTILISER.

Made from the Waste of the Lobster Tinning Factories in Newfoundland and Nova Scotia.

The most beneficial and the cheapest Fertiliser in the Market for Nursery, Vegetable, and Flower Gardens, and for Conservatories, producing the highest results with the smallest outlay. Ask your Seed-man for a shilling 1 lb. Tin, with printed directions for use, and see that you get none other.

For Wholesale Quantities address:—
5, SALTERS' HALL COURT, CANNON ST., LONDON, E.C.

THOMSON'S IMPROVED VINE AND PLANT MANURE.—This valuable Manure is made only by us. Every bag and tin has our name on it. To be had of all Nursery and Seedsmen, and direct from us. 1 cwt. and over carriage paid. London Agent—Mr. GEORGE, 10, Victoria Road, Putney. W.M. THOMSON AND SONS, Clovenfords, Galashiels, N.B.

BEESON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 13s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

Bonâ Fide **BENTLEY'S** Bonâ Fide
WEED DESTROYER.

Mr. J. HUDSON, Gunnersbury House Gardens, writes:—"I am glad to say that the Weed Destroyer has given us every satisfaction; it proved most effectual, and is a great saving of time and labour."
Mr. A. WARD, Stoke Edith Park Gardens, writes:—"I am pleased to tell you that I am exceedingly gratified with the results of your Weed Destroyer, as it destroys both Weeds and Moss on the walks most effectually, and gives the gravel a bright appearance."
In the following sizes, carriage paid:—
3 Gallon Drums, 5s. 6d. | 12 Gallon Casks, 19s. 0d.
6 " " 10s. 0d. | 18 " " 27s. 6d.
40 Gallon Casks, 50s.

CHEMICAL WORKS,
BARROW-ON-HUMBER, HULL.

THE JUBILEE YEAR OF THE GARDENERS' CHRONICLE.

THE *Gardeners' Chronicle* was founded, in 1841, by the late Dr. Lindley, Sir Joseph Paxton, and others. It proved a great success from the first, having then few competitors. As the exigencies of the time have required, it has been trebled in size, so far as horticultural matters are concerned. Illustrations which at one time were few, and given only at intervals, are now numerous and regularly issued. The price has been reduced one-half, and though there are now many competitors in the field, the *Gardeners' Chronicle* is generally recognised as the leading authority in all matters relating to Gardening, Garden Botany, Forestry, and the sciences connected therewith. What others think of it may be judged from the following from among many unsolicited expressions of opinion:—

EXTRACTS FROM THE PRESS.

"THE *Gardeners' Chronicle* has faithfully held to its promises. It is still, to-day, the best gardening journal, being indispensable equally to the practical gardener and the man of science, because each finds in it something useful. We wish the journal still further success."—*Garten Flora, Berlin, January 15.*

"THE *Gardeners' Chronicle* celebrated, on Jan. 2, the fiftieth anniversary of its foundation. This is, in [English] garden literature, an unique event. . . . The publication is one of special excellence."—*Vossische Zeitung, Berlin, January 7.*

"THE *Gardeners' Chronicle*, one of the most justly renowned horticultural journals of the world, celebrates the fiftieth anniversary of its foundation. The career of this publication, which is an authority in scientific as well as in practical matters, has been most successful and interesting. . . . With such a past, there can be no doubt as to its future."—*Revue Horticole, Paris, January 16.*

"THE *Gardeners' Chronicle* is known wherever intelligence in horticulture is appreciated."—*Meehan's Monthly.*

"THE first issue of the *Gardeners' Chronicle* for the year is a jubilee number devoted largely to a commemoration of the fiftieth anniversary of that journal's first appearance. Founded by Dr. Lindley and Sir Joseph Paxton, its policy has always been directed by men of accurate knowledge and scientific temper. Its trusted correspondents have been among the foremost of skilled cultivators and recognized authorities in the sciences related to horticulture. During its life of half a century, its influence has tended to elevate and dignify the art of horticulture, not only in England, but throughout the world, and it was never more worthy to command respect than under its present management. Our venerable contemporary is to be congratulated on the possession of so honourable a history, whilst its future is bright with the promise of ever-increasing usefulness."—*Garden and Forest (New York), Jan. 21.*

"We wish to give ourselves the pleasure of recognizing an event in the career of a respected contemporary. . . . The *Gardeners' Chronicle* is the senior by only seven years of the *Journal of Horticulture*, and, to speak paradoxically, we may venture

to say, that both these journals are as young as ever, and disseminate, each in its own way, matter of interest to botanists and horticulturists throughout the world, where the science of botany is studied, and the art of gardening is practised by the community."—*Journal of Horticulture, February 5, 1891.*

"THE JUBILEE OF THE 'GARDENERS' CHRONICLE.'—On January 2, 1841, appeared the first number of a weekly paper which, thanks to the scientific research and practical knowledge of its editors, soon became, and has ever since remained, the principal horticultural medium in England.—*Illustration Horticole, Brussels, Jan. 1891.*

"One of the best conducted English horticultural papers, the *Gardeners' Chronicle*, celebrated the fiftieth year of its existence on January 2. This journal was called into existence by Dr. Lindley and Joseph Paxton. Two of the first and most industrious assistants were the recently-deceased landscape gardener Marnock in the practical part, and James Bateman, who published a series of interesting articles on epiphytal Orchids. Of other eminent writers, there are mentioned the names of Charles Darwin, Dean Herbert, Sir W. Hooker, who, in 1841, was appointed Director of the Royal Botanical Garden, Kew; Sir J. Hooker, Professor Daubeny, Dr. Royle, Henslow, MacIntosh, Curtis, Phillip Frost, Robert Thompson, Robert Fortune, and Berkley."—*Moller's Deutsche Gartner Zeitung, Erfurt, February 1, 1891.*

"For the past half a century, the *Gardeners' Chronicle* has been the leading horticultural and botanical newspaper in the United Kingdom. . . . With such a talented proprietary and staff of editors, it is not surprising that the paper was at once recognized, and took up a leading position as the first horticultural journal of the kingdom. Its success has been very great. . . . Very few of the first working printers on the paper are left to witness the prosperity of the venture, except the writer of these lines (the editor of the *Press News*). . . . The *Gardeners' Chronicle* is still recognized as the leading horticultural journal of the kingdom."—*Press News, January, 1891.*

"The *Gardeners' Chronicle* has just celebrated its jubilee, its first number having appeared January 12, 1841. The founders were Dr. Lindley and Sir

Joseph Paxton. It is to be congratulated upon its long and eminent list of contributors, and upon its constantly increasing usefulness. It is one of those gardening journals that have become a necessity, not only to the practical gardener, but to the professional botanist as well."—*The Botanical Gazette (American), February, 1891.*

"This important journal renders great service in acting as an intermediary between botanists and horticulturists, impressing on the one the true principles of classification and nomenclature, and on the other, the fact that the observation of living plants in the garden teaches many things which cannot be learnt, either in the herbarium or the laboratory, facts which the new generation is disposed to overlook."—*Alphonse de Candolle, Geneva.*

"Let me offer my best felicitation on the semi-centenary jubilee of your splendid *Chronicle*, which you have edited with so much talent, knowledge, and discrimination, for so long a while as the worthy successor of the great Lindley. Wishing the *Gardeners' Chronicle* also in future a splendid success under your able leadership, I remain, Ferd. von Mueller, Melbourne."

"You have brought the *Gardeners' Chronicle* into an admirable condition of prosperity and authority. Of all analogous publications, the *Chronicle*, with no possible reservation, takes the lead. It is more widely read than any of the horticultural journals, owing to its wider circulation. The matter is the most varied, and the illustrations the most correct and elegant. What I wish is, not the continuance and enhancement of your success, for that is certain, as the future will prove, but the continuance of that marvellous energy which has had such excellent results already."—*Maxime Cornu, Director of the Jardin des Plantes, Paris.*

"In 1841, Lindley and Sir Joseph Paxton enriched horticulture with this high-class periodical, in which science has always taken an equally important part with practical information. The issue for the 3rd of last January was devoted to the celebration of the anniversary. The *Gardeners' Chronicle* cannot fail to prosper under its present management, which is conducted with unusual ability and skill."—*Le Jardin, Paris, March 20, 1891.*

THE GARDENERS' CHRONICLE

("The Times of Horticulture").

A WEEKLY ILLUSTRATED JOURNAL,

CONTAINS

PRACTICAL INSTRUCTION & SEASONABLE INFORMATION IN ALL DEPARTMENTS OF GARDENING

Notices of all Horticultural Matters of Current Interest, Reports of Exhibitions, Reviews of Books, and Home, Colonial, and Foreign Correspondence.

Original Illustrations by W. H. FITCH, F.L.S., W. G. SMITH, F.L.S., W. J. WELCH, JOHN ALLEN, and Others.

THREE ABSOLUTELY TRUSTWORTHY GARDENERS' FRIENDS.

CAMPBELL'S FUMIGATING INSECTICIDE

Big Facts:—
Mr. WILLIAMS, Gardener to Earl Lisburne:—"I have given your New Fumigating Material a thorough trial. Nothing could be more simple to use, nor more effective in its work."

Big Facts:—
Mr. THOMSON, Gardener to the Duke of Buccleuch:—"One of the best inventions connected with horticulture that has been introduced for many a long day. I will never use Tobacco paper again."

Mr. CULVERWELL, Gardener to Sir F. Millbank, Bart.:—"The Fumigating Insecticide is very effectual. I have recommended it to several people."

Mr. GEO. WYTHES, Gardener to the Duke of Northumberland:—"Pleased with Insecticide; answered its purpose thoroughly; for Orchids a boon."

PRICES:—

For houses with a 1000 cubic feet, No. 3 Roll, 1/- each Post capacity of 12000 " " " " " 4 " 19 " " " Free.
The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.

The Safest and Most Effective Liquid Insecticide for Dipping or Syringing.

Mr. FLACK, Gardener to the Marquis of Cholmondeley:—"Your Lemon Oil is most effectual and safe, destroying every insect it comes in contact with, as well as having such cleansing properties."

Mr. MILNE, Gardener to Lord Delamere:—"Your Lemon Oil Insecticide is the best, safest, and most effective I have ever used."

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half-gallons, 5s. 9d.

A truly valuable remedy. Has saved thousands of Bulbs.

CLIBRAN'S EUCHARIS MITE KILLER.

Mr. B. CROMWELL, Cleveley Gardens, says:—"The result of using your EUCHARIS MITE KILLER is, that our stock of Eucharis is now furnished with dark-green leathery foliage, and pots full of strong fleshy roots."

PRICES, post-free:—Half-pints, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLDFIELD NURSERIES, ALTRINCHAM;
A-10 and 12, MARKET STREET, MANCHESTER.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supercede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

THE STOTT PATENT DISTRIBUTOR, PATENT SPRAYER, PATENT SYRINGE, KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillar and all Insect Pests, and Prevention of Mildew.

Mr. NORMAN, gardener to the Right Hon. the Marquis of Salisbury, writes as follows under date April 20, 1891.—

Mr. STOTT. The Gardens, Hatfield House, Herts. Sir,—I am pleased to report that I consider your Distributor a very useful invention for mixing your Insecticide Killmright as it passes through the hose, supplied by gravitation.

Your Sprayer is the best I have used. It is very easy to damp a large house of plants with Insecticide without it running into the soil to damage the roots. The Sprayer may be used on either garden engine pipe, or on pipes where the water is laid on—I am, yours truly,
G. NORMAN.

Retail from Ironmongers, Seedsmen, and Wholesale and Retail from The Stott Distributor Co., Ltd., Barton House, Manchester.

SLUGICIDE (Registered).—CERTAIN DEATH TO SLUGS. Harmless to Plant, Vegetable, and Animal Life. Delicate seedlings are absolutely secure when sprinkled with "Slugicide." 1s. 6d. per box. All Seedsmen wholesale.
The SLUGICIDE COMPANY, 6, Maryleport Street, Bristol.

CLERK, in Nursery and Seed Trade; thorough knowledge of both branches. Good correspondent and bookkeeper.—H. Y., Messrs. Miles & Co., West Brighton Nurseries, Hove, Brighton.

HOLLOWAY'S PILLS.—The Hour of Danger.—Disease commonly comes on with slight symptoms, which, when neglected, increase in extent, and gradually grow dangerous—a condition which betrays the greatest remissness—when these Pills, taken in accordance with their accompanying directions, would not only have checked, but conquered the incipient disorder. Patients daily forward details of the most remarkable and instructive cases in which timely attention to Holloway's advice has undoubtedly saved them from severe illness. These Pills act primarily on the digestive organs, which they stimulate when slow and imperfect; and, secondly, upon the blood, which is thoroughly purified by them, whence is derived the general tone they impart, and their power of subjugating hypochondriacism, dyspepsia, and nervous complaints.

CADBURY'S COCOA

ABSOLUTELY PURE
THEREFORE BEST

**"WINNING EASILY"
FOR
STAYING POWER
AND
ABSOLUTE PURITY.**

"CADBURY'S COCOA has, in a remarkable degree, those natural elements of sustenance which give the system endurance and hardihood, building up muscle and bodily vigour with a steady action that renders it a most acceptable and reliable beverage."—HEALTH.

The MEDICAL ANNUAL advises Practitioners to remember that when recommending Cocoa as a food and beverage for Invalids, the name CADBURY on any Packet of Cocoa is a guarantee of purity.

Rare and Valuable Orchids.

MR. RICHARD PFAU has entrusted me with the sale of the following rare and valuable ORCHIDS, collected by him in Costa Rica, all of which are now offered in perfectly established plants, viz.:

BARKERIA ELEGANS, nice plants, 5s. each.
ODONTOGLOSSUM KRAMERI.—According to Collector, this very distinct and beautiful species will always remain scarce, being very rare in its native country. Nice plants, of flowering size, 30s. each; fine strong plants, 105s. each.
ODONTOGLOSSUM OERSTEDEI MAJUS.—This very distinct and fine variety has larger flowers, and several flowers on each spike, much superior to type. Fine plants, 5s. and 7s. 6d. each; 42s. per dozen.

TRICHOPILIA COCCINEA ATRORUBENS.—The entire lip of a deep blood-red colour, very fine variety, 7s. 6d. and 10s. 6d. each.

TRICHOPILIA TURIALVE, Rehb. f.—Very rare and most distinct species, with citron-yellow flowers; only one single plant found by Collector, 25s.

TRICHOCENTRUM PFAUI, Rehb. f.—A pretty winter flowerer; flowers of long duration. Small established plants, 7s. 6d. each.

The stock being very limited, early orders respectfully solicited.

Orders will be executed in strict rotation, and forwarded Post and package free to any part of Great Britain or Continent. Terms, payment within 30 days after receipt of plants, either by Post-office Order or crossed Cheque, made payable to **EDWARD ORTGLES**, Inspector of Botanic Gardens, Zurich, Switzerland.

OVER 100 ACRES OF NURSERY.

Without which none is genuine.

THE "PERFECT" WEED KILLER

Without which none is genuine.

Unrivalled for Destroying Weeds on Garden Walks, Carriage Drives, Stable Yards, &c. Recommended by the entire Horticultural Press, including *The Field*, *The Garden*, *Gardeners' Chronicle*, *Gardening Illustrated*, *Gardeners' Magazine*, *Journal of Horticulture*, and *Gardening World*. Supplied to Her Majesty's Commissioners of Works, and used regularly at Kew Gardens, &c.

Prices:—1 gal., 2s.; 5 gals., 1s. 9d. per gal.; 10 gals., 1s. 6d. per gal.; 40 gals. at 1s. 4d. per gal. Carriage Paid on 10 gallons.

SOLE MANUFACTURERS:
THE HORTICULTURAL & AGRICULTURAL CHEMICAL COY.,
97, MILTON STREET, GLASGOW (ORIGINALLY OF TUNBRIDGE, KENT).

CAUTION TO THE PUBLIC.—Please carefully note our Name, Address, and Trade Mark, and do not be deceived by imitations and apparently lower prices of inferior articles.

NOTICE IS HEREBY GIVEN, that by virtue of an Order of the High Court of Justice, dated May 26, 1891, the use of the name AGRI-HORTICULTURAL CHEMICAL COY. on Show-Cards, Circulars, Labels, or otherwise howsoever, by Parties recently trading under that name at Tunbridge, Kent, is ILLEGAL, and that our Manufactures cannot be obtained genuine in Tunbridge except from our Agents, Messrs. WILMER & WARDLEY, Chemists, there.

Rare and Valuable Orchids.
MR. F. C. LEHMANN, German Consul at Popayan, United States of Columbia, has entrusted me with the sale of the following Rare and Valuable Orchids, all of which, *Pescatorei Dayana* excepted, are now offered in perfectly established plants, viz.:—
CATTLEYA DOWIANA AUREA, 10s. 6d. and 15s. each.
" TRIANÆ, Popayan varieties, 5s. each; fine, strong, 10s. 6d. each.
ODONTOGLOSSUM CRISPUM LEHMANNI, 3s. 6d. and 5s. each.
" EDWARDI, most distinct and beautiful species, very slow and difficult to establish. Small, but perfectly established plants, 10s. 6d. each.
" HALLII LEUCOGLOSSUM, fine plants, 15s. and 21s. each.
" XANTHOGLOSSUM, fine plants, 10s. 6d. and 15s. each.
ONCIDIUM KRAMERI, quite distinct and superior to *O. Papilio*, several plants on each block, 5s. and 7s. 6d. per block.
" PYRAMIDALE, rare and very pretty, with dense upright panicles of golden-yellow flowers, with conspicuous clear-white centre, 7s. 6d. and 10s. 6d. each.
" UNULATUM, most beautiful species, belonging to the *Macranthum* section, 15s. and 21s. each.
PESCATOREI DAYANA, very rare and beautiful, figured in *Bot. Mag.*, t. 6214. Recently-imported plants, showing new growth, 7s. 6d. and 10s. each; 60s. per doz.
TRICHOPIA FRAGRANS ALBA (PILUMNA NOBILIS?), all segments clear white, with orange-yellow eye; very sweet scented. 3s. 6d., 5s., and 7s. 6d. each.
Orders will be executed in strict rotation, and forwarded, Post and Package free, to any part of Great Britain or Continent. The Stock being very limited, early Orders respectfully solicited. Terms, payment within thirty days after receipt of Plants, either by Post Office Order or Crossed Cheque, made payable to—
EDWARD ORTGIES, Inspector of Botanic Gardens, Zurich, Switzerland.

NOW READY. **CARTERS'** NOW READY.

WHITE ROMAN HYACINTHS.

THE FINEST OF THE YEAR.

Very large Bulbs ... price 3s. per dozen; 21s. per 100.
Good flowering Bulbs ... price 2s. per dozen; 15s. per 100.

All Carriage Free. Special Quotations for Large Quantities.

Seedsman by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales.

Seedsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales,

237 HIGH HOLBORN, LONDON

STANDEN'S MANURE.

Established 30 Years.

Exceeds all others in general fertilising properties and staying powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry Powder, with very little smell.

It is consequently particularly adaptable for Ladies interested in Plant Culture.

The highly fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

Sold in Tins, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each.

And in Kegs (free), at Reduced Prices:—28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

LETHORION (VAPOUR CONE), (PATENT).

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure.

PRICES—For Frames, &c., of 50 cubic feet, 6d.; 100 feet, 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each.

Owing to the enormous demand, intending users should give their Seedsmen Early Orders to secure a supply.

By permission of the Hon. Board of Customs DUTY FREE.

TOBACCO PREPARATIONS FOR HORTICULTURAL USE.

THE "LONDON" TOBACCO JUICE. (FREE OF DUTY.)

Manufactured from strong American Leaf Tobacco, and highly concentrated. Sold in bottles:—Pints, 1s.; quarts, 1s. 9d.; half gall., 2s. 6d.; gall., 4s. Or, in casks of 10 gallons, and upwards, at 2s. 6d. per gallon.

EXTRA STRONG TOBACCO JUICE.

Specially manufactured for Evaporating in Greenhouses. Pints, 1s. 6d.; quarts, 2s. 9d.; half-gall., 6s.; gall., 11s. And in kegs of 5 gallons, 10s. 6d. per gallon; 10 gallons, 10s. per gallon.

THE "LONDON" TOBACCO POWDER.

This preparation consists of best Virginian Tobacco, finely ground and mixed with other ingredients of an essential character. Price, in tins, 1s., 2s. 6d., and 4s. Or, in bulk, £3 per cwt.

NICOTINE SOAP.

An effectual and speedy Eradicator of Scale, Thrip, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting plants, without injury to foliage. In jars, 1s. 6d. and 3s. each, and in tins, 5s. 6d., 15s. 6d., and 25s. each.

The above articles are manufactured only at our Bonded Stores, Shad Thames, S.E., and are the only reliable Horticultural Tobacco Preparations produced. We caution the public against spurious articles offered by several firms.

CORRY, SOPER, FOWLER & CO. (LIMITED).

16, FINSBURY STREET, E.C.; And SHAD THAMES, S.E., LONDON.

As a Supplement TO THE GARDENERS' CHRONICLE FOR Next Week, August 8, Will be Published an Ink-Photograph of a Range of Houses Erected by Messrs. RICHLARDSON & CO., For C. FURNESS, Esq., M.P.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 1, 1891.

BOWOOD PARK.

BOWOOD is always worth a visit, even when the gardener is holding his hand for a while, with a very reduced staff, as he is doing at present in the absence of the Marquis of Lansdowne, who is serving the country as Viceroy of India. I entered the park from Calne, having travelled by railway from Devizes and Chippenham on one of the few delightful days of a cold and showery May. The house, park, gardens, and pinetum at this famous seat are all very handsome and first-rate and the country around is historically interesting and the landscape beautiful. The house is finely placed, sheltered by woods, yet not encumbered. A stream runs through the lower part of the park, and widens into a lake of 50 acres, long, but not canal-like, widest before the house, and winding up the valley—a vista of water with wooded shores and varying promontories. It is a very pleasing scene from the windows of the stately mansion, and in spite of the water, it offers no suggestion of fogs, damps, and rheumatic pains. If Dr. Priestley, in residence here a hundred years ago as librarian and friend of the Earl of Shelburne, or if Moore, the poet of whom Byron said, "Tommy dearly loves a lord," a frequent visitor here fifty years ago, had walked down towards the head of the lake, as no doubt they did sometimes, and had passed the spot where the overflow escapes through some ornamental rockwork to the meadows below, they might have reached on the right a promontory of the lake, where a summer-house of classic architecture stands, like the portico of a Greek temple and from this spot they would see that the great house is placed well above the water on the banks of the lake, and considerably removed from it.

Owing to the high site, one can see from the terraces beneath the windows—from the midst of the seclusion of the wooded park—the fair country beyond; luxuriant woods and farms in the foreground, the boundary of the chalk hills beyond, with the smooth and rounded surface of the Cherhill Downs, having the Lansdowne column at the top, and a white horse cut in the slope. The chief entrance to the park is from Derry Hill, a little village of ornamental houses

THE TWO BEST CABBAGES

ARE DICKSONS FIRST AND BEST, and DICKSONS PERFECTION.

Per packet, 6d.; per ounce, 1s. Post free.

Mr. A. J. LONG, writing on June 1, says:—"I am very pleased with your 'First and Best' Cabbage, which I sowed last summer for the first time. We have been cutting for the past three weeks, and I cannot hear of anyone else cutting so early. The plants withstood the severe winter remarkably well."

For other CABBAGES, LETTUCES, ONIONS, &c., for present sowing, see CATALOGUE, sent post free on application.

DICKSONS CHESTER

WEBB & SONS, WORDSLEY, STOURBRIDGE

clustered partly round a small green in front of the entrance, where an arched gateway flanked by a tower; some handsome iron gates, and the sculptured arms of the family on the wall above the gates, intimate the neighbourhood of a lordly residence. A drive of 2 miles through the deer park brings us to the house, a three-storeyed mansion in the Italian style, with terraced flower gardens on the south and east fronts. It is gratifying to observe that the taste of the owners has not been satisfied with the architectural beauty of their dwelling alone, since they have covered the walls with creepers—Roses, Honeysuckles, Wistaria, and Virginia Creeper. On the west side, a long wing or extension—imitated from the Emperor Diocletian's palace at Spalato—includes the library and an orangery, having a narrow border under the wall filled with various alpine, none of which were brighter in May than the rose-coloured Thrift, and that very handsome dwarf Phlox setacea atro-purpurea. Oranges and Bays in tubs are placed upon the terraces in summer. Among the appropriate shrubs which cover the walls of the terraces, I noticed Banksian Roses, Kerria japonica, Clematis montana, Magnolia conspicua, two species of Pyrus japonica—albo and atro-purpurea; Garrya elliptica, Forsythia viridissima, and that handsome white-blossomed evergreen, Choisya ternata.

Between the park and the house there are several series of terraces, each supported by a wall, and each ornamented by handsome stone balustrades, and planted in the manner just described. There are gravel walks and geometric flower borders, filled with such plants in their season as may suit a garden with palatial surroundings. Everything at Bowood is spacious and grand. A house as comfortable as it is ornamental, built by a statesman and man of letters, filled with works of art, and famous as the resort of distinguished men, stands amid terraced gardens in a beautiful English park. The Earl of Shelburne selected his site well.

The pleasure grounds are entered immediately behind the house, and include 60 acres, devoted to ornamental trees and shrubs, and a pinetum which seems to have been planted forty or fifty years ago with choice specimens. At the entrance to this part of the grounds the Cedars of Lebanon are very fine. Then comes a specimen of Abies Douglasii, still 100 feet high, though wrecked by wind unfortunately three years since. A number of large and spreading evergreen Oaks help to shelter the pinetum, which is, in fact, so well protected that within its boundary one hears the wind in the surrounding tree tops without feeling its full force. I am afraid that the public who are freely admitted here may sometimes abuse their privilege by transposing the labels, since the first tree we came to was named Abies elegans, and is 50 feet high, and full of foliage, whereas A. excelsa elegans is described in Veitch's *Manual of the Coniferae* as a dense shrub, growing only from 5 to 7 feet high. Abies grandis flourishes here on the light soil, which suits most of the conifers. P. resinosa, however, the red Pine of Canada, is not quite happy here. There are many specimens of Sequoia sempervirens, with fine drooping foliage, which have already reached 70 feet in height. As this giant of the Pacific coast, the Californian Redwood, takes the second place in size among the coniferous trees of its native country, reaching 300 feet, it has still much to do before attaining at Bowood its typical height. Cryptomeria japonica is grateful for its sheltered situation and looks well.

Two specimens of Abies cephalonica stand side by side, and were putting forth their young shoots in the third week of a late and treacherous May, and seem hardy notwithstanding their Mediterranean origin. Cedrus atlantica is 60 feet high here, and wears its characteristic foliage, tinged with blue. This tree forms the prevalent arborescent foliage of Mount Atlas, and as it came to England after 1841, it must have reached Bowood early, probably in the time of the third Marquis, who was a patron of horticulture, and enlarged and embellished the ornamental grounds. The Chinese Arbor-vitæ, Biota orientalis pendula, is one of the curiosities here, and among its neighbours are Junipers and Cypresses in great variety.

The kitchen garden covers 4 acres, which are divided into four compartments by walls, an arrangement affording space for a large quantity of wall fruit. There are five vineries, two Peach-houses, a stove, and a number of pits. Probably the extent of this part of Mr. Nelson's charge is beyond the requirements of the relative of the owner who, at present, occupies Bowood. The soil here is light and warm, and this may partly explain the very vigorous and early growth of the Asparagus Kale, a variety which Mr. Nelson recommends beyond all others. It has supplied abundant sprouts since the end of March this season, and the more they are plucked the more freely they break. Sheep farmers would have been glad of a few acres of such Greens this year. The seed of this productive Kale is sown early in June, and the plants are set out in August.

Lilies of the Valley were in blossom in the kitchen garden on May 16, and the Gentianella, doing well on this soil, had put forth its deep blue blossoms. The beds of Pansies were brilliant, and the rows of Aubrietia could not be ignored, common as the plant may be. The abundance of Spinach showed the warmth of the soil; and a fine specimen of Ceanothus Veitchianus on the wall, cut by frost for the first time since it was planted here, recalled to mind that a famous gardener and ardent horticulturist once commanded an army of gardeners here, and introduced to their present sites some of the plants we now admire here, at a time when they were more novel in English gardens than they are now. It cannot be said that Mr. John Spencer made Bowood, but, at least, he did much to render it famous. *II. E.*

NEW OR NOTEWORTHY PLANTS.

LÆLIA GRANDIS, Lindl., var. *TENEBROSA*, Hort.

This, as its name implies, is a dark variety of *Lælia grandis*, a species described by Lindley as long ago as 1850, but which, until recently, has been a rare plant in gardens. The typical form has nankeen-yellow, decidedly undulate segments, and a white lip with rosy-purple veins. Until the appearance of the present form, very little variation had been observed in the species. In May, 1889, a flower from the collection of H. Tate, Esq., jun., of Allerton Beeches, near Liverpool, was sent to Kew by the Liverpool Horticultural Company, which, I thought, must be a peculiar dark variety of *Lælia grandis*. A year later, Mr. A. H. Grimsditch, of Clayton Square, Liverpool, sent a flower with leaf and pseudobulb, saying it was introduced by his principal, M. Travassos, from a new district in Brazil. It has since flowered with Lord Rothschild at Tring Park, E. Gotto, Esq., of Hampstead, and Messrs. Linden, of Brussels, and proves to be quite constant in character. The seg-

ments are flatter than in the typical form, less undulate, and of a decided copper-bronze tint, while the lip is wholly purple, somewhat lighter near the margin, and darker in the throat. The plant exhibited by Lord Rothschild at a recent meeting of the Royal Horticultural Society received a First-class Certificate. It is no trifling variation, as is so frequently seen in this group, but a very distinct geographical variety, and a decided horticultural acquisition. The successive flowering of the plants mentioned above only proves the constancy of the characters pointed out, and it may yet have to be considered a distinct sub-species. *R. A. Rolfe.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA SCHRODERÆ ALBA.

A BEAUTIFUL variety, with the sepals and petals white, while the crisped lip has a large central yellow blotch. In addition to its snowy whiteness, it exhales an exquisite perfume. *Reichenbachia*, t. 17, second series.

LYCASTE SKINNERI ARMENIACA.

A form of this beautiful species, remarkable for the apricot-coloured segments and lip. Mr. Rolfe has an interesting note on the history of the species. *Reichenbachia*, t. 18, second series.

ODONTOGLOSSUM EXCELLENS, VAR.

A superb *Odontoglossum*, a natural hybrid between *Pescatorei* and *triumphans*, like *O. eugenes*, *O. Vuylslekanum*, *chrysolanum*, and "Albert Edward," the particular variety figured. *Reichenbachia*, second series, t. 19.

LÆLIO-CATTLEYA ELEGANS VAR. BLENHEIMENSIS.

A natural hybrid between *Cattleya guttata* and *Lælia purpurata*. The sepals and petals are spreading, fleshy, and of a deep rose colour; the lip a deep crimson. According to Mr. Sander, it is best grown in baskets, in a rather sunny, moist position of the *Cattleya*-house, suspended near the glass, in a temperature of 65° to 70° in winter. In the summer the temperature may rise much higher. The plants are unlike *Cattleyas*, and should never be allowed to become thoroughly dry. *Lælio-Cattleya elegans* makes two growths during the year, and is extremely variable in its time of flowering. "The attempt," says Mr. Rolfe, "to refer the plant to either of the parent genera only involves us in all kinds of inconsistencies." *Lælio-Cattleya Schilleriana* ×, in like manner includes all the hybrid forms between *Lælia purpurata* and *Cattleya intermedia*. *Reichenbachia*, t. 20.

ONCIDIUM DIVARICATUM, Lindl.

At the Château de Boterlaer, at Durne, near Anvers, an example of this Brazilian Orchid is now in bloom with a stem which measures about 8 feet, and bears 784 flowers. A plant of *Cattleya Mossii*, Miss Zoe (?), is noteworthy on account of the markings on the petals. *Z.*

TOMATO FORCING.

1. The Tomato can be forced for winter bearing to advantage, but it demands close and constant attention.
2. A Tomato-house should be very light, warm, and the roof should be at least 5 feet above the beds or benches.
3. An abundance of sunlight is essential.
4. The temperature should be about 60° to 65° at night, and 70° to 80° during the day, or higher in full sunshine.
5. House Tomatoes demand a rich soil, and a liberal supply of fertilisers.
6. In this latitude, house Tomatoes bear when four to five months old.
7. Tomatoes like brisk bottom-heat. They may be grown in large boxes, or upon benches; 18-inch

square boxes, placed about a foot apart, and containing four plants to the box, afford one of the neatest and best means of growing Tomatos.

8. Winter Tomatos must be trained. From one to three stems, depending upon the distance apart of the plants, are allowed to grow from each plant. These are trained upon perpendicular or ascending cords. The plants must be pruned as fast as new shoots appear. The heaviest clusters should be supported.

9. Water may be used more freely early in the growth of the plant than later. Wet the soil thoroughly at each watering, rather than water often. When the fruits begin to set, keep the atmosphere dry, especially during the middle of the day.

10. In midwinter, the flowers should be pollinated by hand. This may be done by knocking the pollen from the flowers when the atmosphere is dry, and catching it in a spoon or other receptacle, into which the stigma is thrust.

11. One-sidedness and much of the smallness of

14. Lorillard, Ignotum, Volunteer, Itaca, Golden Queen, and Beauty, we have found to be good winter Tomatos.

15. Insect pests are kept in check by fumigating with Tobacco, and the spotted mite by Hughes' Fir-tree oil. Fungi are controlled by ammoniacal carbonate of copper and Bordeaux mixture. *L. H. Bailey, Cornell University Bulletin.*

A FRENCH TOWN GARDEN.

IN nothing in the case of towns has there been so remarkable a progress during the last quarter of a century as in the formation and decoration of parks and open spaces. Who is there that remembers the stony wilderness at Amiens, dominated over by a beperiwigged notability, but will be astonished and delighted with the change that now meets his eye. In this issue we give an illustration of a more recently

minds of some people who, in this matter, are in the long run penny-wise and pound-foolish, we would suggest, that while the rate-payers might be asked to provide for the formation and up-keep of the parks and spaces, the specially decorative features might be supplied by public subscription, or by the donations of philanthropic individuals having the welfare of the citizens at heart—in the same manner that, having provided a suitable gallery, generous donors contribute the pictures.

COLUMBINES.

At one time Columbines were regarded as common plants, as few people were acquainted with any species or varieties except those to be found in cottage-gardens and shrubberies; but since the introduction of the lovely Colorado species, and others, they have come under notice, and are much

FIG. 16.—TOWN GARDEN AT ABBEVILLE.

house Tomatos appears to be due, at least in part, to insufficient pollination.

a. One-sidedness appears to result from a greater development of seeds upon the large side.

b. This development of seeds is apparently due to the application of the pollen to that side.

c. An abundance of pollen applied over the entire stigmatic surface, by increasing the number of seeds, increases the size of the fruit.

d. The pollen, either directly or indirectly, probably stimulates the growth of the fruit beyond the mere influence of the number of seeds.

12. The second crop of fruits is obtained by training out a shoot or shoots from the base of old plants, by burying the old plant, or by starting a new seedling crop. The first method appears to be the best.

13. House Tomatos in this latitude yield about 2 lb. to the square foot. The amount of the first crop does not appear to influence the amount of yield in the second crop from the same plant.

formed garden in the neighbouring town of Abbeville. The situation is flat, and not much has been done to vary the monotony of the surface. The groups of trees selected for colour effect—dark shades of green of varied intensity, in front of Birches and light-foliaged trees—serve to break up the formality, while the treatment of the water is satisfactory. The flower-beds are ugly, and not to be commended. "*Mais c'est la mode!*" We have mentioned certain French towns, but it must not be forgotten that we were in advance of our neighbours, and such towns as Canterbury, Ipswich, Derby were provided with these welcome resting-places years before the time we speak of. We can but repeat what we have so often said, that the chief requirement of our towns now-a-days is not so much large parks at a distance from the centres of population, but numerous smaller ones interspersed throughout the more densely populated portions. As the question of expense, and the necessity of "keeping the rates down" are paramount in the

sought after as decorative plants for the borders. One of the most pleasing of the named kinds is *Aquilegia chrysantha*, which grows about 2 feet high, and blooms freely, the flowers being of a soft canary-yellow colour, and they have very long spurs, which render them attractive and of striking appearance. *A. cœrulea*, another that was introduced to the public at about the same time as that just mentioned, has spurs almost equally long, and produces widely-distended flowers of a rich pale blue shaded with white; but as this kind dies out so quickly, rarely lasting more than three or four years, and has to be raised from seed, it is difficult to get and keep it true, especially if any others are near. This being so, plants of it should be isolated for seeding purposes, as it is far too good and valuable to lose or become degenerated by being impregnated with commoner kinds, and yet much has been gained in that way, as witness the box of exquisite blooms, possessing so many shades of colour, exhibited by Messrs. Veitch at the Royal Botanic Show,

on the 13th of last month. These are destined to enrich our gardens, and it is more than likely that they have the hardy, enduring character of some of the older sorts; and, if so, then there will be but little trouble in keeping them. Be this as it may, they should be largely grown; the way, I think, in which Columbines look best, being in groups or large patches, mixed, as then they show each other off to advantage. To be really successful with the finer varieties, they must be treated as biennials instead of perennials, the most suitable time for sowing being early in spring, as then the plants have a long season's growth, and become strong by the autumn. Many, however, sow as soon as seed is ripe, and plants raised in August flower the following year, if pricked out and grown freely on as soon as they are up and of a size fit to handle. For semi-wild places, such as the hardy fernery, or wide pleasure-ground borders, the most vigorous kinds of Columbines are quite unrivalled, as in such situations they look quite at home, and become naturalised, and take care of themselves. *J. Sheppard.*

WINE PROSPECTS IN BURGUNDY.

WHILE the Bordeaux district of France has been fighting and overcoming the Phylloxera, mildew, and other scourges of the vineyards, Burgundy, having been attacked later, scarcely yet shows the same progress in victory over the insidious foes. It is a melancholy sight for those who knew the "golden slope" in days before the arch enemy of the Vine marched into occupation, to mark the scars still left, where every cubit had its "pleasant plant," standing deep-rooted in the ruddy soil, many of the "ceps" associated with memories of half a century of rosy wine. But grass and weeds hide now on too many a golden hill the rich red soil, and it will be years before some of the famous *crus* regain their former position, both as to quantity and quality.

We are indebted to Monsieur Louis Latour, Maire of Aloxe-Corton, one of the largest growers and holders on the Côte d'Or proper, and who has spent his life amid the vineyards, growing and tending wines, for a personally conducted survey of his district and for much practical information as to the prospects and condition there of viticulture. He has lately added to his properties the Château Corton, an estate well known till the Phylloxera almost destroyed its vineyards, and hopes in a few years to restore it to its pristine reputation. The estate is about 120 acres in extent, and he calculates having, on the purchase, replanting, and culture, to spend between thirty and forty thousand pounds before the vineyards will give him a proper yield, which fact will give some idea of what the losses have been on other estates.

The means used to combat the various ills to which the Vine seems heir in these latter days are those which our columns from time to time have made familiar to our readers. *Bouillie Bordelaise* for the mildew and other cryptogamic scourges which endanger the produce by attacking the plant in leaf and shoot, and bisulphide of carbon distributed to the roots, are the principal remedies. The French Government contribute, and the municipal authorities add to the subsidy, towards the expensive campaign against their common enemies, effective control and supervision being provided to ensure the funds being properly applied, and the due proportion met by the proprietors whose vineyards are affected.

Burgundy has again "caught on" of late years with our British wine drinkers. When our rulers by heavy differential duties almost killed the trade in French wine to encourage the produce of our ally Portugal, it was Burgundy above all that passed almost away from lip and literature. The contemporary colouring of the time of the Stuarts, Dutch William and Queen Anne, is rosy with the wine of Burgundy. Pious Dick Steele quaffed her vintages not wisely but too well; strong-headed Joseph Addison loosened his tongue without beclouding his brain with the same generous fluid; and the high-

bred beaux and roisterers of that day—a time so vivid in dress and doubtful deeds—reeled home, top-heavy with too much of the wine from the *cuvées* of the Côte-d'Or.

But great though the ravages have been in her vineyards, Burgundy can still give to the British *bourgeois* as good a wine as most of those gallants quaffed, at a price which cost of transport, &c., then placed far beyond their modest reach. Large buyers, such as Messrs. Gilbey and others, give the single-bottle buyer a Pommard at 1s. 6d. per bottle which has been bought first-hand as grapes, vintaged on the spot, stored in cool cellars in the limestone, and when fit to bear the voyage and the bottling, shipped *via* Dieppe and Newhaven to our shores.

The old Duchy included, roughly, the present departments of the Côte d'Or, Saône-et-Loire, and Ain, a country all wine-bearing, more or less, some 120 miles long by 40 miles broad. Purists may press to confine the name of "Burgundy" to the Côte d'Or, but no such limits are needed as a guarantee for its integrity. It would be as sensible to draw a line round the choicest district of the Haut Medoc, and deny to all the rest of the Bordeaux district the name of "Claret" for its wines. Macon, while well within the old Duchy, is more than 80 miles south of the centre of the Côte d'Or proper, which gives the name to its department, and is a large wine centre, round which is vintaged a huge quantity of genuine wine, distinctively racy of the soil, though lacking that highest quality and flavour which in former days raised to their present pre-eminence such names as Clos-Vougeot and Chambertin. From the district round Macon to that centre itself, and northward to the cellars of the merchants in Beaune and Dijon, go millions of gallons to be rightly distributed as "Burgundy;" were it not so, this sound red wine would be beyond the pockets of all but the wealthy. As matters fortunately stand, no citizen who has fifteen or eighteenpence to spare need lack a glass of genuine Burgundy if he have a respectable wine merchant or grocer within hail.

INSECT PESTS.

THE HOP LOUSE.—Prof. Riley, in a circular recently published by the United States Department of Agriculture, sums up the history of this pest. The eggs are laid on Plum trees. These produce wingless, so-called females, which feed on the Plum, and in their turn produce, by agamic reproduction, winged aphides, which desert the Plum and settle on the Hop, where they give birth to other generations of wingless individuals, and, ultimately, to a generation of winged aphides which fly back to the Plum, and on it give origin to the true female insects, which are wingless and never leave the Plum. Thus, there is but one generation of sexed insects produced, and this at the close of the life-round, the females, wingless, on the Plum trees, the males, winged, on the Hop. All intervening generations (and there are many) are parthenogenetic. If we had to deal with a fungus, we should call the latter sporophytes, producing spores, whilst the true sexual generation would be the gametophyte. From these points in the life-history, Prof. Riley concludes that it will pay to spray all Plum trees in the vicinity of Hop gardens in the spring or in the fall, after Hop picking. All wild Plum trees in the vicinity of the Hop gardens should be destroyed, and the Hop vines should be burnt.

Spraying the Hops can be made quite effective, the more so, as during the summer the lice cannot migrate, excepting by crawling from one garden to another, so that a careful grower is not in this case at the mercy of an apathetic or careless one. Kerosene emulsion is the best, made as follows:—Kerosene, 8 pints; water, 4 pints; soap, half a pound. Dissolve the soap in the water, heat it to boiling, and add it when boiling hot to the kerosene. Churn the mixture by means of a force-pump, and spray for five or ten minutes, till a smooth creamy emulsion

is formed. One part of this should be diluted with twenty-five parts of water when required for use. A spray-pump with a Riley nozzle is required, and may now be had of our makers.

THE NUN.—We have already called the attention of our readers to the devastation of the Pine forests caused by a moth (*Liparis monacha*) in Bavaria and Belgium. The only really effective remedy, according to an article in *Insect Life*, is the grease-band, such as is used for the winter moth of fruit trees, the object being to prevent the ascent of the larva.

CHANCELLOR SWAYNE'S GARDEN.

IN the close of Salisbury Cathedral, about 100 yards westward from the west entrance door, and actually under the shadow of its lofty spire, Chancellor Swayne has his substantial residence. At the rear of it is first a lawn and then a garden, which extends about 150 yards down to the lazy Avon, which meanders past it in a southerly direction. Both lawn and garden are pleasantly situated and admirably kept, and contain a charming diversity of character and variety of subject within the space of less than 2 acres. Admirably arranged collections of hardy herbaceous and alpine plants are to be found in fine condition as regards health and floriferousness, each plant being allowed ample space for proper development. Some owners of collections of these fine plants place the several species and varieties in masses, which, although they make a grand display when they are in flower, are nevertheless not to be commended, on the ground that large and very undesirable unoccupied spaces occur in the floral picture as plant after plant goes out of flower. Canon Swayne's practice, which is worthy of general adoption, is to intersperse individual plants of different species, that is, individual plants of species known to flower in May are disposed among those whose flowering-time is June and July, and in this way there are no large unoccupied spaces to mar the picture in either the beds or the borders; the proportionate number of species and plants necessary to make a floral display each month during the period indicated having received full consideration when the beds and borders were planted.

On entering the gardens from the house, the view westward is a charming one. Close at hand, and in various directions, are very natural-looking rockeries of irregular surface and outline, and gay at this season of the year with the foliage and flowers of a choice collection of Alpines, to which the crested fronds of the *Lastræas*, *Athyriums*, &c., in the hardy Ferneries, a little way off, and the healthy specimen *Wellingtonia gigantea*, with its branches brushing the beautiful green sward, which can only be found in these old gardens, lend charm as well as variety. Leading further, and as a continuation of the lawn, is a faultless turf walk, 100 yards long, and having a width sufficient for six persons to walk abreast. Herbaceous borders, 10 feet in width, line the sides of this pleasant path, which in the season of flowers are ablaze with a variety of plants of almost every conceivable colour. Beyond are pastures, and further yet, the woods of Lord Pembroke, with occasional glimpses of the winding Avon and the Wyllye, which—

"Now hid in shade, they work their silent flood
Through the dark mazes of the pendant wood."

Standing sentry-like at the ends of these twin borders are two handsome columns of *Cupressus Lawsoniana*, guarding, as it were, the entrance to a third garden. This garden has its own well-filled beds and borders set at short intervals in the verdant, closely shaven lawn, and its Ivy and Clematis-clad arbours at each end of the broad gravel walk which skirts the Avon—truly as quiet and lovely a spot as either poet or artist in meditative mood could desire. The flowers which fill the rear parts of the

borders consist of Phlox, Delphinium, Helianthus, Michaelmas Daisy, Spiræa, Aconitum, and the like. The plants in flower in the body of the borders at the time of my visit, at the end of June, were, in addition to the Delphiniums, Peonies, nearly over; Poppies, of various shades of colour; Aquilegias, also nearly over; Campanula, Lobelia, Chrysanthemum, Pyrethrum, Eryngium alpinum, Potentilla in variety, including the bright crimson-flowered P. Etna; Gaillardia, including G. hybrida splendida, with chocolate centre and golden fringed flowers; Gillenia trifoliata, with elegant spikes 24 inches high and light flowers; Amaryllis longiflora, Veronica, Erodium Manescavi, Linums, Betonica grandiflora, Spiræa filipendula flore-pleno. Polemonium Richard-

of Cypripedium is quite hardy here, and the bed is top-dressed with leaf-mould in winter. The finely-developed flowers of white and rose colour form a very conspicuous whole; in the same bed Iris Kæmpferi, in a few examples, were in flower.

In concluding my brief notes of a very interesting and excellently managed garden, I may be permitted to record my indebtedness to Chancellor Swayne for his courtesy in showing me through his beautiful garden and describing some of the choicest subjects on the way. H. W. W. [Views in the Canon's Garden have been painted by Mr. A. Parsons; see notice of the same, p. 468 of *Gardeners' Chronicle* for April 11, 1891; *Rouge et Noir*, and the previous paragraph. Ed.]

so far as that could be done without interfering with the few fine trees still remaining.

WHAT IS THE GOOD OF IT?

A good many people seem to think it is wise to indulge in a general wail over the decay of country life. Perhaps they feel better for it; like certain kinds of women, it does them good to cry. To hear these persons talk you would certainly think that the land is full of abandoned farms, and that the cultivation of the ground is sure to result in loss and disaster. All the young men are going off to the cities in search of the fortunes they never can find

FIG. 17.—THE KEW EYOT.

sonii, the spikes with sky-blue coloured flowers, and stems about 15 inches, narrow, with finely divided leaves, is very effective. Tufts of Dianthus alpinus and D. crenatus showed themselves to great advantage, standing as they did in close proximity to the turf, as also the several varieties of Armeria, Aubrietias, including A. Hendersoni, Veronica prostrata, Pansies, &c. I must not omit mention of a group of Cypripedium spectabile in fine flower that stood close to one of the small glasshouses; these plants are growing in peaty soil placed on an artificial stratum of clay, which just suits these moisture-loving plants. They are slightly shaded from the mid-day sun by a neighbouring shrub. This species

THE KEW EYOT.

Now that the fate of this beauty spot is under discussion, we give an illustration (fig. 17), showing its condition some fifteen years ago. The illustration will suffice to show what has been lost in the interval, and it feebly indicates what we shall gain by the extension of the view over Brentford!

What should be done to save and protect the islet, is so perfectly well-known, that we need not repeat what has been said so often. Our impression is, that the island should be placed under the management of the authorities of the Royal Gardens, Kew, and utilised for the growth of Alders and Willows,

in the country! Now while this melancholy company may feel better for their wailing, it doesn't do a particle of good to anybody else. If they were polite they would pull down the curtains and have a good cry all by themselves where nobody could hear or see them.

It is not wise, it is "not good business" to listen to these people. It is one of the everlasting verities that out of the ground come all food, all raiment, all wealth, all good things worth having. One kernel of corn will grow into a plant bearing two ears of corn containing 200 kernels, or an increase of 400 per cent. in six months on a piece of the earth measuring 2 x 2 x 1 feet. Where is the trade or

business in any city that will pay such an increase? Wall Street is ridiculous beside such a percentage, and yet they say it does not pay to raise corn! It pays Nature—she grows rich. And if a field of corn increasing at this rate, does not pay the owner, there is something the matter with the man. It is not the plant, or the field. Forever and ever, so long as the world holds men, there will be a demand for food, and every particle of it must come out of the earth or the sea. Every ounce of food is, first of all, a plant. Forever and ever, then, will there be a demand for plants. The growing of food can never be unprofitable, if the right man be at the plough.

Never in the history of the world were there so many to eat in proportion to those who gather food from the earth. Never did the earth yield so much in proportion to the labour spent upon it. Never before did it cost so little labour to earn food. The great cities of to-day would be impossible if the food they consume had to be raised by hand tools or teamed to market by horses. There are not horses enough in the world to haul the food from the farms to the towns. There are not men enough in the entire country to cut the grass or gather the grain by hand. How then is it possible that the ancient art of gardening is falling into unprofitable decay? It is not. Gardening or producing plants and food on small pieces of ground is simply in a transition state. Take the Potato. It was a garden crop, it is now a farm crop. To raise Potatoes at a profit it must be treated as a manufacture; it must be done on a large scale, with the largest, best and most powerful tools.

The man who harvests one acre of Potatoes by hand cannot compete with the man who harvests a hundred acres by machinery. Shall he, therefore, give up his acre garden and say that gardening does not pay? Not a bit of it. Cover the acre with glass and don't raise Potatoes. It's business, not sentiment. Gardening will pay, always did pay—the business gardener.

Moreover, never before did the great mass of the eating population (that's everybody) want so much food. Never before were the eaters so particular as to what they eat. The American wants the best, and he can pay the best. He uses more fruit than any man who ever lived. His wife wants more flowers than ever woman wished for before. It is idle to say that it does not pay to produce fruit and flowers. Perhaps it doesn't pay you. It pays somebody, and if it is not you, why, did it never occur to you that there was something the matter with you?

You and I and all of us who are producing food from the ground, are tired of the people who wail about the unprofitable farms and gardens; we are too busy to stop to listen to such creatures. Let them go off to the cities and stay there. They are not worthy to live in God's country. We know that seed time and harvest shall not fail. We know that the food-producing business is simply suffering a great and grand change for the better. The changing may be a trifle uncomfortable (moving day always is), but the move is an advance. Gardening is growing safer and surer. It is becoming more scientific, more exact, more like a manufacture, and therefore more profitable. We are looking forward and not backward, and much prefer those who will lend us a hand to those who merely sit on the fence and howl. What is the use of wailing? *Charles Barnard, in "Canadian Horticulturist."*

REMARKS ON THE FRUIT CROPS OF 1891.

[For Tabulated Summary, see p. 97.]

SCOTLAND.

ABERDEEN.—Owing to slight frost and cold N. and N.E. winds when in bloom, Apples set badly and are a poor crop, with the exception of a few trees growing against walls, which carry a heavy crop. Pears are a fair crop for this district. Plums are also a fair crop. Cherries had an abundant

blossom, but they set badly. Bush fruits had also plenty of blossom, but are a miserable crop. Strawberries and Raspberries will be good and abundant. Everything is about two weeks later than usual. *John Forrest, Haddo House, Aberdeen.*

AYRSHIRE.—The fruit crops in this neighbourhood are, without exception, a complete failure, and the poorest that we have known for years past. The mild weather which we had in February, followed by the severe frosts in March and April, are the chief cause of the failure. *N. McKinnon, Dumfries House, Cannoek.*

— Apples are looking very well at present, and should be much better than usual, being a fair size already. Gooseberries are a good crop, other small fruits not so heavy as usual. The weather has been too dry for the Strawberries, and the fruits are, therefore, much smaller than we usually have them. *W. Priest, Eglinton Gardens, Irvine.*

EAST LoTHIAN.—Apples blossomed profusely, but the weather was too dry and sunless for a good set. Pears are generally clean and good. Apricots are a very poor crop indeed. Small fruits are, in some places, abundant; in others there are none. Strawberries, and all other crops up to date, are suffering from the intense drought. *R. P. Brotherston, Tynninghame.*

FORTHSHIRE.—On account of the dry, hard weather experienced in spring, the fruit crops in this district are not up to our expectations. Excepting Pears, all kinds bloomed well. Peaches, Nectarines, and Apricots, are not much grown out-of-doors, but what there is, especially Apricots, are much finer than usual. The blossom of Pears, Plums, and Cherries, was much injured by 10° of frost on May 17. The Apple blossom, which was unusually fine this season, got severely cut by the severe frosts in the second week of June (8° on 9th, 6° on 11th, 3° on 13th). Early Strawberries and small fruits suffered severely by same frosts. Crops about a fortnight late. *Jas. Whitton, Glamis Castle Gardens.*

— Strawberries and all small fruits very abundant, and of excellent quality in this neighbourhood, but later than usual, owing to the low temperature up to the second week in June—on the 18th, 63°, 22nd and 26th, 70°. Rain fell on one day, but only slight showers. *James Mitchell, Panmure Gardens, Carnoustie.*

KINROSSHIRE.—The mild month of February, succeeded by a very severe March, had a good deal to do with a scarce crop of small fruit. Last year's cold, late season is, in my opinion, to blame for the failure of Apples, Pears, and Plums in this district. *John Fortune, Gardener, Blair Adam.*

MIDLoTHIAN.—Fruit trees were remarkably late in flowering this season, especially Plums and Pears, and although there was an abundance of blossom, the raw harsh weather which prevailed in April and May, when the trees were in flower, caused much of it to drop without setting, and what did set was much thinned by the cool dry weather which followed till near the end of June. Since then the weather has been very favourable, moist and warm, and fruit of all kinds is promising to be a much finer crop than could have been anticipated a month ago. The trees and bushes have been very free from insect attack, and the genial rain and heat have caused the fruit to swell freely, and it now promises to be of large size and good quality. Apples, Apricots, Cherries, Pears and Plums are all excellent; but Peaches and Nectarines suffered from the cold spring, and are below the average, the finest being the early varieties, especially Hale's Early Peach and Lord Napier Nectarine. All small fruits are abundant and very fine, but much later in ripening than usual. *Malcolm Dunn, The Palace Gardens, Dalkeith.*

BANFFSHIRE.—After the fine ripening autumn of last year, fruit trees of all sorts showed an abundance of blossom, and most sorts have set a fair crop. Victoria, Early Prolific, and Jefferson Plums are heavily cropped, both on walls and standards. All

the early Apricot blossoms were killed on March 14, but the later ones set well, and we have still a good crop of clean healthy fruit. Peaches are thin, but trees healthy and vigorous. Small fruits abundant, but later than usual. *C. Webster, Gordon Castle.*

NAIRN.—The fruit crops have not fulfilled the early promise when in flower; all the larger fruit on walls and in the open garden dropped, and left but a sprinkling on most of the trees. Small fruit, such as Gooseberries, Currants, Raspberries, and Strawberries, are a full crop. *James Maitland, Cawdor Castle.*

PERTHSHIRE.—We have been gathering Strawberries since June 28 in fine condition. The Captain is our best early this year; Noble is also very fine. Peaches on open wall are very good crop; also Nectarines. The sunshine enjoyed recently is greatly in their favour. *P. W. Fairgrieve, Dunkeld House.*

SUTHERLANDSHIRE.—Apples and Pears are very much under average; many trees which were heavily cropped last year show no crop this season. Plums, as well, are a short crop. Gooseberries are thin. Early Strawberries are giving good gatherings. Raspberries look well, but Black and Red Currants are thinner than usual. The inclement spring has left its mark on our fruit crop. *D. Melville, Dunrobin Castle Gardens.*

ENGLAND.—NORTHERN COUNTIES.

NORTHUMBERLAND.—The fruit crop here is exceptionally fine. Apples above the average; Red Calville (the best early), Lord Suffield, Keswick Codlin, Lord Grosvenor, Stirling Castle, Yorkshire Beauty, Ecklinville, Bismarck, Alfriston, Glamis Castle, Ribston (on walls), and many others, good. Of Pears on walls, Beurré Diel, Beurré Clairgeau, Broxmouth Park, Beurré Superfin, Louise Bonne of Jersey, Marie Louise, Keele Hall Beurré, Hacon's Incomparable, Easter Beurré, are a full crop and good. Doyenné du Comice promises to be good here. Plums (Victoria) are extraordinarily fine on walls; also Jefferson; Coe's Golden Drop, Kirke's, &c., good. May Duke Cherry very fine. Apricots, Peaches, and bush fruit are all very fine. *George Harris, The Castle Gardens, Alwick.*

WESTMORELAND.—The spring of this year was the coldest in the memory of our oldest inhabitant, and 13° of frost on Whit Monday destroyed the remnants of a once promising show for fruit. Apples in orchards did not show much blossom, but wall trees had plenty. Strawberries are fine, although the first and largest blooms were frosted. *W. A. Miller, Underley, Kirkby Lonsdale.*

DURHAM.—Owing to the cold east winds during the time when in blossom fruit did not set, and on May 17 and 18 sharp frost with snow prevailed. The frost caused part of the Currants and Gooseberries to fall, but I have a fair crop owing to not pruning, the foliage protecting them in early spring. Strawberries are very small, the very dry weather in May and June, and little rain so far in July, having told on them disadvantageously; all other crops are suffering, and the grass is burnt up in many places. *R. Draper, Seaham Hall.*

— The unusually late spring we have had made us hopeful that the abundance of bloom of all kinds of fruit we had would escape the much-dreaded spring frosts, but on May 17 we had occasional snowstorms during the day, and in the evening a blinding storm, which lasted upwards of an hour, leaving quite a thick covering, which was followed by 13° of frost, totally destroying all unprotected bloom, and it is only the late blooming varieties of all kinds that are fruitful now; notably so are the two Codlin Apples, Keswick and Manx, both bearing abundantly. One strange phenomenon of the storm still visible is that no damage was done more than 20 or 30 feet high, the foliage beyond that height retaining its spring glory, whilst all the lower portions had the appearance of having been boiled. *Richard Westcott, Raby Castle, Darlington.*

YORKSHIRE.—The fruit crops, on the whole, are

much better than could have been expected, after the severe frost—15°, May 17—which took the first bloom of the Strawberries, which are plentiful, but rather small. Apricots are very thin on the open walls, plentiful in the open shed. Cherries and Currants suffered a great deal from the frost; Morellos are a good crop, being late in flowering. Pears are a fair crop on walls. Standards of the Hesse Pears have a heavy crop. *Bailey Wadds, Birdsall, York.*

YORKSHIRE.—The 10° of frost which we experienced on Whit Sunday night played sad havoc here. In the thirty-four seasons that I have been gardener here, I never saw such a scarcity of fruit. Strawberries are the only things that are passably good. Peaches come the next, all other things are a long way below an average. *Thomas Jones, Ribston Gardens, Wetherby.*

— All fruit trees bloomed abundantly and looked very promising until May 17 and 18, when we had 13° of frost, which destroyed all the blooms expanded. Gooseberries and Currants set well; but on the top part of the trees the fruit was blackened and killed. Strawberries good. Raspberries an abundant crop. *Robert Kingston, Brantinghamthorpe.*

— The severe frosts of May 17 and 18 ruined Pears and Plums; small fruits, such as Gooseberries, Black and Red Currants, also the first and best flowers of the Strawberries. The frost of the 18th killed the leaves on the green and Copper Beeches. A week afterwards they had the appearance of autumn, and are only now recovering. *R. Cook, Edenthorpe, Doncaster.*

LANCASHIRE.—The frost destroyed nearly the whole of our Pears on the morning of Whit Monday, and every Apple blossom that was showing colour was blackened in the centre. The same may be said of Strawberries, but there were only two or three blooms much advanced on most of the plants. The weather since has been all that could be desired for them, except that we had too many dull damp days last week. Caterpillar has considerably reduced the Apple crop, but at present there seems to be a fair average. *W. P. Roberts, Cuerton Hall, Preston.*

— Apples and Pears are not much good in this part of Lancashire, even in the best of seasons. Plums have very few fruits, and the trees are full of aphid. Too many tall chimneys about us. Morello Cherries on north wall look well and have good crops; other Cherries do no good here, and Peaches and Apricots will not grow here outside. *S. McMaster, Gauthorpe Hall, Burnley.*

EASTERN COUNTIES.

LINCOLNSHIRE.—The fruit crops this year are very disappointing, as we had an abundant show of bloom of all varieties of fruits; but the cold north-east winds, with sharp frosts, made sad havoc with all kinds of fruit not protected, Plums and Cherries suffering the most. The dry weather has been very much against the Strawberry crop, and it will not be more than half a crop. *David Lumsden, Bloholm Hall Gardens.*

— Apples will be quite a great crop in this district. Pears are about an average crop, but the fruit somewhat small for the time of year. Strawberries are very fine, and good in quality. Plums, not very heavy crop, are very fine and clean as yet. *J. Rowlands, Bardney Manor, Lincoln.*

NORFOLK.—The fruit crops have not turned out so well as their promise was at one time, in consequence of the frost and snow. The best crops are Pears and Plums, and although Apples are an average crop, many of the trees do not look healthy. Cherries are very thin; Peaches and Nectarines are very good, an average crop; Apricots bloomed very irregular, the first flowers set best; there is a good crop of Gooseberries and Black Currants; but much fruit fell off—in many places nearly all. Strawberries have been very fine. There are a few small Nuts, but Walnuts are quite a failure. *H. Batchelor, Catton Park, Norwich.*

SUFFOLK.—Apples still falling fast, though possibly an average may remain. The same holds good

of Pears, though hardly to the same extent. Plums are the crop of the season, though many dropped. Cherries have dropped wholesale with few exceptions. Gooseberries and Currants are both under average, though Raspberries are magnificent. Strawberries an average, with the exception of Noble, which is almost a failure. *D. T. Fish, Hardwicke, Bury St. Edmunds.*

SUFFOLK.—The fruit crop in this district gave promise of being unusually good, but the cold east winds, with very severe frosts, have considerably lessened them, especially in exposed situations. Strawberries and bush fruits have been an abundant crop. *H. Rogers, Rendlesham Gardens, Woodbridge.*

CAMBRIDGESHIRE.—The bush fruit in this district is very light; Black Currants a total failure. Acres of bushes have not 1 lb. weight per acre. Gooseberries generally about a quarter of a crop. Raspberries look well, and promise an average crop. Apples are very light. Pears about half a crop. Of Plums, Victorias are a full crop; Early Rivers', Gisborne's, Blue Diamond, and Pond's Seedling, about half a crop; and Gages not more than one-sixth of a crop. Strawberries are very good. The frost of May 17 did some damage, but the caterpillars of the winter moth did much more. *Andrew Grant, The Vineries, Willingham.*

ESSEX.—The fruit trees in this neighbourhood were a grand sight in the spring, as far as bloom was concerned; in fact, it was regarded as being one of the best promises for fruit we have had for many years. In the evening of May 16 we experienced a most severe hailstorm, and on the following morning we had 9° of frost, which made havoc in the bloom. The earlier sorts, which were set, passed off fairly well, and the later varieties, which have not yet opened, have a capital crop. Greenfly on Plum and black-fly on Cherries have been most troublesome. Apples and Pears are very healthy. We have the best crops of Pears on walls. Apples are good on cordons and bush-formed trees. Strawberries have been very good. I consider this a very fair year for fruit for this neighbourhood. *Arthur Cooch, Havering Park, Romford.*

— Apples are dropping off badly, and what promised to be an over abundant crop can barely be described as average. Pears are rather better, and the quality is even better than that of the Apples. Plums promised a most abundant and good crop, but the "blight" aphid has been very bad, and the quality of the fruit is poor. Cherries are good on walls and standards, with the exception of Morellos, which have nearly all dropped off, and the trees are badly blighted. Peaches and Nectarines are an abundant crop, the trees are clean. Apricots have set well, trees healthy. Strawberries have grown rather too much, and a good deal of fruit has been spoiled by wet. *Jas. Douglas, Great Gearies, Ilford.*

— Amongst Plums, Orleans, Green Gage (especially Oullin's Golden), and Victoria are break-down crops. Apples, such as King of the Pippins, Hawthornden, Whorle Pippin, &c., excessively heavy crops; Emperor Alexander, Blenheim Pippin, Kerry Pippin, &c., good average crops. Many Raspberry canes were killed outright by frost; such as passed the ordeal are cropping heavily. Black Currants hereabout are a heavy crop of fine fruit. Apricots abundant. Peaches and Nectarines still an average crop, though fruits have occasionally failed at the "stoning." Nuts are almost nil, owing to earliness in flowering, and concurrent sharp frosts. *William Earley, Double House, Ilford.*

— Fruit crops in this neighbourhood are generally good, particularly stone fruits, which are better than we have had for the last ten years. Small fruits, Currants and Gooseberries, suffered a good deal with the late frosts, which caused a good many to drop. *James Vert, Audley End Gardens.*

MIDLAND COUNTIES.

LEICESTERSHIRE.—Frost, but not of sufficient severity to injure the blooms of certain kinds, occurred during the blooming period, which was

remarkable for its abundance, followed by the result of setting heavy crops of Pears and Plums and Cherries; but in the case of Apples the promise encouraged by bloom was only partially realised. There are many failures in Apple orchards; Frogmore Prolific maintains its character, and Bramley Seedling, which gave heavy crops last year, is again loaded with fruit. Black Currants are very thin; Gooseberries only half a crop, and Red Currants hardly an average; Raspberries abundant; Strawberries also. The good result of covering Apricots with tiffany while in blossom is seen this year in improved crops on the protected walls. I never saw such heavy crops of Pears on walls. *William Ingram, Belvoir Castle Gardens, Bottesford.*

WARWICKSHIRE.—Apples this year are a fair average crop, and the trees free from blight. Pears a heavy crop, trees and fruit looking healthy. Plums and Damsons also a heavy crop, especially the latter, the trees requiring propping. Apricots are unusually good and fine, and the trees healthy. *J. Rodger, Charlecot Park, Warwick.*

— Peaches and Nectarines outside showed well for bloom, but the set was very bad, owing to the frost. Pears suffered in the early part of season with maggot, but there is, notwithstanding this, a good crop. Damsons bloomed very well, but the crop is a poor one. The Gooseberry bushes are not so much infested by caterpillars as usual as with red-spider. I find lime-water good for them, and use it about three or four times a week with the engine. For the caterpillar on Pears we pick the leaves and burn them. *T. Beddard, Stoneleigh Abbey, Kenilworth.*

RUTLANDSHIRE.—One of the best seasons we have had for Strawberries; a few of the earliest flowers were killed by late frosts; the flavour is good and the crop is finishing off well. Apples and Pears have not set such heavy crops as were anticipated, but there is plenty for a good crop. Those few trees which bore well last season have the fewest this year. We had no frost worth mentioning while the flowers were opening, but the weather was very dull, snowy, and wet, and the failure of many of the blossoms in setting is probably due to depression of vigour when it was most wanted. *W. H. Divers, Ketton Hall, Stamford.*

BEDFORDSHIRE.—Fruit trees on the whole carry healthier foliage than for the last three years. Caterpillars have not been so destructive, still quantities of the best Apples and Pears show scars from their early attacks. Considering the snowfall and severe frosts in the middle of May, crops all round will be more favourable than expected. Apples, Pears, and Apricots are an average crop, as are Plums—Victoria again proving the heaviest cropper. Morello Cherries lost much fruit at stoning time. Small varieties of Damsons carry good crops. Currants are thin, particularly the Blacks. Strawberries bear well, but the fruit is not so fine as usual. *A. MacKay, Woburn Abbey, Beds.*

BUCKS.—With the exception of Black Currants all the rest promise to yield abundant crops, and the trees taken collectively are less subject to the attacks of insect pests this year than is generally the case. The crops of Peaches and Nectarines on the walls out-of-doors this year set in such quantities as I never in my experience beheld before. *G. T. Miles, Wycombe Abbey.*

— We had a grand promise for a fruitful year on our large Plum orchards until the frost of the nights of the 17th and 18th of May. The trees being in full bloom, it cut off more than half the crop. We shall now have nearly half a crop of most varieties of Plums and Damsons, and Apples are a good average crop, and the trees clean and healthy. Strawberries have been a very heavy crop, and small fruits of all kinds abundant and good. *J. Smith, Mentmore, Leighton Buzzard.*

— The fruit crops generally are fairly good in this neighbourhood. Apples are rather under average, but as this district was favoured with a very good crop last, a full one could scarcely be expected

this year, although the trees were laden with blossom. Among orchard trees, Cox's Orange Pippin, Blenheim Orange, King of the Pippins, Calville Rouge, and Sturmer Pippin are cropping well; also the following pyramid trees on Paradise stock:—Cox's Pomona, Grenadier, Cox's Orange Pippin, Lord Derby, Bramley Seedling, Lord Grosvenor, Bismarck, and Prince Albert. Pears about half a crop. Peaches and Nectarines a good average crop; trees now making good clean growth. All Apricot trees carrying a heavy crop—more than for several years past. Plums of nearly all kinds are heavily laden with fruit, especially Victoria and Golden Drop. Cherries also are plentiful in this district, both orchard and wall trees. Bush fruits and Strawberries plentiful and good. Black Currants suffered rather from late frosts, crop consequently rather under average. Filbert and Cob Nuts a fair crop; Walnuts none. *C. Herrin, Dropmore, Maidenhead.*

HERTFORDSHIRE.—Apples, where sheltered, have a fair crop of clear-skinned good fruits; where exposed to the late spring frosts, they are a failure. The nice rains, which came just right for the Strawberries, greatly helped to bring the late blooms on, the earliest being killed by the late frosts. Pears are an excellent crop, and the trees clean; also Peaches, Nectarines and Apricots are very good all round. *Joseph Pitt, Panshanger Gardens, Hertford.*

— Heavy crops of Apricots on all the trees. Apples thinned by the late spring frosts, but some trees have fair crops, conspicuous among them being Prince Albert, Lord Suffield, Lord Grosvenor, Worcester Pearmain, Irish Peach, Keswick Codlin. Pear trees are well cropped. Plums have heavy crops mostly, as have the Damsons. Strawberries plentiful but not such fine fruit as last year's, the foliage being much injured by caterpillar. Currants, Gooseberries, Raspberries, the heaviest crop we have had for the past ten years. Filberts not so good. Peaches and Nectarines well cropped; Cherries plentiful. *James Charles Mundell, Moor Park.*

WESTERN COUNTIES.

GLOUCESTERSHIRE.—All stone fruits on walls bloomed, set, and are swelling well. The fruit on the majority of the trees required a great deal of thinning. Pears and Apples are an average crop, and look very promising. Plums and Damsons on standards are very poor, owing to the destructive frost on May 17. Gooseberries, Currants, and Strawberries: fruit very fine, the bushes not being so heavily laden as in previous years. Outdoor Figs killed back by severe winter. *Arthur Chapman, Weston Birt, Tetbury.*

MONMOUTHSHIRE.—Eight degrees of frost in the third week of May destroyed here a splendid prospect of hardy fruit. Pears, Plums, and Cherries, which were in full blossom, suffered disastrously; Apricots were frozen through, Strawberries and Currants also suffered, while Gooseberries were only slightly injured, and Raspberries escaped through being later in flowering. Early flowering Apples were likewise considerably injured, but some of the late kinds carry good crops. Strawberries are abundant, although rather small. Raspberries are also plentiful. On higher elevations near us the crops of Cherries, Pears, and Plums are good, but the quality of the first-named is second rate. Altogether for us this is an unsatisfactory year for hardy fruit. *Thomas Coomber, The Hendre, Monmouth.*

WORCESTERSHIRE.—Apples of Keswick Codlin, Ecklinville Seedling, and Stirling Castle types are full crops, Cox's Orange Pippin and King of Pippins are all well laden, Blenheim's and many other of the large and early flowering kinds very sparse and lightly cropped. The hardy cider fruits more abundant. Apricots are clean and good, but there are many cases of branch dying, especially where the trees have been planted in loose soil, making rank growth whilst young, and heavily cropped afterwards. Plums are abundant, especially of the Pershore Egg Plum. Damsons partial. Victorias and Early Prolifics heavy crops. Coe's Golden Drop

and other choice dessert kinds good on walls. Cherries nearly a failure in this district, except Morellos on walls. Peaches and Nectarines very good crop, and trees healthy, although aphid has been persistent and troublesome. Small fruits on bushes were injured by frost on Whit-Monday night, 7° thermometer below freezing from 10 P.M. to 7 A.M. Strawberries: early bloom suffered, nevertheless full crop. Walnuts scarce. *W. Crump, Madresfield Court, Malvern.*

WORCESTERSHIRE.—Apples and Pears generally are light crops, but there are exceptions, and in some few cases heavy crops are noticeable—these in sheltered situations. Trees are very healthy and vigorous, and show but little of the ravages of caterpillar; this pest appears to be very much on the decrease—for this we are no doubt very much indebted to the birds, for nearly all kinds took them freely, especially so during the breeding season. There appeared to be no perceptible difference on trees that were dressed and those that were not. *John Austin, Witley Court, Stourport.*

— Taking orchards and gardens round about us, there is an excellent crop of fruit, and the trees, as a rule, are clean and healthy. Apples, without exception, are carrying a full crop, also Pears on walls and as standards. The crop of Plums and Damsons is the heaviest seen for years, and the trees, though supported by numbers of props, are breaking in all directions; bush fruits, too, are quite a full crop, and very good in quality, ripening up very rapidly. *Walter Child, Croome Court, Seicrux Stoke.*

SALOP.—Good old standard sorts of Apples are a good average crop; Pears much the same; Plums in this immediate district under the average, but in places that I have heard of, Damsons are a very heavy crop. *James Loudon, The Quinta, Chirk.*

CHESHIRE.—The Apple crop in this district, if taken collectively, will reach the average, the early varieties carrying good crops, the later ones rather light. All fruit trees have suffered considerably from blight. Pears are rather under the average, but Damsons are above it. Small fruits are fairly good, with the exception of Black Currants, which are almost a failure. Strawberries are bearing heavy crops, Noble being very fine; but it is very deficient in flavour, yet valuable for its size and earliness. Good crops of Waterloo, President, and other main varieties, and promising well. *Jno. V. Smith, Arley Hall, Northwich.*

— A magnificent show of blossoms on nearly all fruit trees gave promise of a very plentiful fruit crop; but a continuance of east and north-east winds, with occasional frosts during the time of flowering, reduced the quantity of fruit set to little over an average crop of Apples and Pears. Small fruits, Strawberries, &c., are a good average; Gooseberries very plentiful, but Black Currants a very light crop. Damsons, in sheltered situations, very plentiful, but exposed to north and east, not above average. Fruit trees, generally, look healthy. *Wm. Whitaker, Crewe Hall, Crewe.*

SOUTHERN COUNTIES.

MIDDLESEX.—Many of our hardy fruits gave great promise early in the season, but the severe frost and hail-storm on May 17 did much damage to trees in bloom; many of the best kinds of Apples have not a fruit on them, but Manx and Keswick Codlin have good crops; there are a few Kings, Quarrenden, and others. Peaches, Nectarines, and Apricots set heavy crops, and are now looking well. Cherries and Plums, which gave promise of heavy crops, have mostly dropped prematurely; those left are good-sized fruits. Pears very thin, and in same condition as Apples, our best trees being Nouvelle Fulvie, Beurré Diel, Beurré Capiaumont, Williams' Bon Chrétien (very good), Beurré d'Amanlis, Ne Plus Meuris, and Louise Bonne of Jersey, the latter very good on all aspects and on pyramids in the open; Marie Louise and Glou Morceau also. The best Plums are Coe's Golden Drop, Rivers' Prolific, and Kirke's Victoria. *G. Wythes, Syon House, Brentford.*

SURREY.—Never was the fruit prospect so good as this year, every twig well studded with good flower buds, which opened well, and set freely, Pears, Apples, Plums, and Cherries alike. The storms of snow, hail, and sleet, which fell on the eve of Whitsuntide, spoilt all this fine show. The snow lay on the ground to the depth of 4 inches, with eighteen degrees of frost in the morning, and every fruit was cased in ice; even then there was a large percentage of late bloom to open, but owing to the often sudden low temperature through June, which checked the sap, it has caused a severe thinning of the fruit. Peaches and Nectarines are good and clean, but, like other things, are late. Apples promise to be of good quality, although thin. Pears are better than for some years. Red and White Currants are good crops but have short racemes. Blacks are a very thin crop, the worst I have had for twelve years. Strawberries are a heavy and fine crop. Raspberries also promise to yield a good return; we have only just begun picking. *A. Evans, Lythe Hill, Haslemere.*

— The fruit crops of the present year are, with the exception of the Gage varieties of Plums, remarkably prolific, and of excellent quality. Strawberries have suffered somewhat from the heavy rainfall. *James Gold, High Ashurst, Dorking.*

KENT (see ante, p. 104).—Apples may be considered an average crop, but many trees are fruitless; the blossom was very abundant. Cherries bloomed well, but many orchards very short of fruit. Plums bloomed and set very well; crop good. Aphid very abundant, and especially damaging to Plum and Cherry trees. Peaches on walls much curled in leaf, and not looking very satisfactory at present date—much wood killed by frost. Figs killed back, and not likely to bear crop this season in many places. On the whole the crop of fruit not up to the expectation formed from the abundant blossom. Caterpillars have done very much less harm this season than in two previous ones; orchard here quite clear of them. *G. A. Don, Bedgebury Park, Hawkhurst.*

SUSSEX.—The spring was cold and late; the result was, that the blossom did not open till late, and but little frost came afterwards, and now we have in this part of Sussex a magnificent crop of fruit of all kinds, such as we have not had for years. The gardens here are 400 feet altitude, so that we escape many of the late spring frosts, and I do not prune small fruit bushes so much as one generally sees, with the best possible results. I also am a great advocate for bees being kept in gardens; they help to set the blossom. *Joseph Rust, Eridge Castle.*

— Apples and Pears are much cleaner grown this year than usual, and some Pear trees have had to have their fruit thinned considerably, whilst others have only just a crop. In small fruits the late frosts ruined the crops of Black Currants, but reds and whites are about average. *Alexander Reid, jun., Possingworth, Cross-in-Hand.*

HAMPSHIRE.—Trees of all kinds bloomed very freely. It was thought though that the 7° frost experienced here on May 17th would have utterly ruined the crops, but the amount of leafage which the trees had on them no doubt protected the fruits somewhat. All kinds now look healthy, Pears on walls especially so; and with the exception of a few aphid the trees are clean. The early blooms of the Strawberry plants were all spoilt by the frost in question, which has retarded the crop and lessened the price obtained by the market growers in the neighbourhood, of which there are many. *E. Molyneux, Swanmore Park, Bishops Waltham.*

— Generally speaking, the fruit crop about here is not so bad as in past years. Apples, although under the average, are very much better than they were in 1889 and 1890; Pears are much under the average. *Geo. Rea, Heron Court, Christchurch.*

BERKSHIRE.—All kinds of fruit are much more plentiful and good about this neighbourhood than for many years past. Apples are the thinnest crop, so many having fallen off after the frost on May 17. *Jas. Tegg, Bearwood, Wokingham.*

BERKSHIRE.—Apples in this district will be good both in gardens and orchards. Plums in abundance on walls and standards. *J. Rose, Lockinge, Wantage.*

I have put the Apple at two-thirds of a crop in this neighbourhood, and a great proportion of trees in my survey are without any fruit upon them. Pears in the same condition. Plums are simply an enormous crop; but Damsons are very capricious, some bearing enormously, whilst others alongside have none. Cherries, wherever I have seen them, are bearing heavy crops, but the fruits are small. Peaches, Nectarines, and Apricots bear off the palm this season. Small fruits, taking them altogether, will be a good average; mine are all extraordinarily good, though none of them run large, which I consider to be in their favour. My Grapes will be late, and my unprotected Figs will present me with a few dishes. My Wellingtons or Dumelow's Seedling fail to crop this year, but the foliage is very healthy. *Robert Fenn, Sulhamstead Abbots, Reading.*

Apples, which promised well, have, with a few exceptions, dropped too many of their fruits, some trees becoming almost bare. Wellingtons and Blenheims, which last year had very heavy crops, are thin this season. Pears abundant; Plums in profusion. Cherries a good crop, but attacked with black fly a good deal early in the season. Peaches and Nectarines rather irregular; better on an east than on a south wall. Waterloo, Amsden's June and Alexander Peaches will be ripe by the end of July. Gooseberries abundant and of good quality. Currants and Raspberries good. Strawberries good; Jubilee and Eleanor prolong the season better than other late kinds with us. *George Stanton, Park Place, Henley-on-Thames.*

WILTSHIRE.—I presume an examination of the reports of the Apple and Pear crops in the southern and western counties for the present year will show a good average. The situation here being low and close to the water, we suffer much from late spring frosts, which this year extended into June, to the detriment of many crops. However, although our Apple and Pear crops are below average, we have a pretty fair crop on the whole. Some trees of Early Juneating, Early Nonpareil, and the always sure-cropping variety, Keswick Codlin, and several local Apples are heavily cropped, espalier-trained; while in our orchard, some large trees of Blenheim Orange are fairly well cropped. Green Gage Plums in every position, including trees which were not protected while in flower, as well as those which were, are immense crops, the trees being in fine condition. Peach, Nectarine, and Apricot trees had to be severely thinned of their fruit, so thickly did they set. Small fruits and Strawberries are immensely heavy crops, the weight of fruit bringing Gooseberry bushes to the ground. *H. W. Ward, Longford Castle, Salisbury.*

DORSETSHIRE.—All varieties of Pears here have done remarkably well; Apples had a promise of doing the same, but some varieties have suffered from late frosts. Apricots are quite exceptionally good for this district. *T. H. Crisp, Canford Manor Gardens, Wimborne.*

SOUTH-WESTERN COUNTIES.

DEVONSHIRE.—All fruits named on the accompanying list are a full average. Stone fruits, excepting Cherries, are all a most promising crop, and much above average. Apples and Pears of the best kinds are not so good as the promise of the spring-time; nevertheless, I think they will yet prove an average crop. *James Enstone, Wear, near Exeter.*

Apples abundant blossom; did not set well; caterpillars destroyed nearly all the rest. Some trees in orchards loaded with fruit, but a large number with not an Apple on them. Strawberries: early blossoms killed by frost, but Noble on an early border escaped, having set its fruit. I have gathered fruits of this variety 1 oz. in weight. *G. J. Barnes, Stoodleigh Court, Tiverton.*

Our fruit prospects early in the season were

most promising—all trees covered with blossom. The Strawberry blossom suffered from frost; the first flowers opened strong, to be cut off by 6° of frost—consequently we lost the best fruit. Apples are still more disappointing, a splendid bloom, and to all appearance good. The blossom remained on so long as to give us confidence of a crop, and now we find quite a tenth of the trees with no fruit at all on them, and the trees are suffering from canker. In gardens and orchards the crops and trees are much the same. *Geo. Baker, Membrand.*

CORNWALL.—The fruit crops in this district were very much injured by the frost on the 17th May, when 5° was registered. Apples are reduced to a very scanty crop. Pears are better, especially on the walls. Raspberries are thin and small; many canes were completely killed. Gooseberries and wall Plums, that were of good size and healthy, withstood it, and these fruits are very plentiful. The Red Currants are hardier than the others, and the frost did them no harm. Damsons and Plums on standards have nearly all dropped. To a close observer of fruit that has been injured by cold, it is interesting to see how each individual fruit has its peculiar deformity. Some are cracked in various forms, others with only a horizontal crack on the face; some are completely coated with rust, others partially so; some have large black spots on them which become rotten if the weather continues wet. When fine growing weather sets in they seem to struggle for existence; some very soon succumb, others become turgid and linger on, ultimately dropping. *C. Lee, Boconnoc, Cornwall.*

WALES.

GLAMORGANSHIRE.—The fruit crop in this district is above the average. Plums are carrying heavy crops, especially the varieties Victoria, Green Gage, and Washington. Strawberries have also been very prolific, President, Vicomtesse, and Noble being the varieties chiefly grown in this district. After a remarkable promise of fruit, the Apple crop will be much lighter than we expected, great quantities having fallen off. Nevertheless, the following varieties are carrying heavy crops:—Blenheim Orange, Lord Sutfield, Lord Grosvenor, Early Margaret, Wellington, Tom Put, Cox's Orange Pippin, and Hawthornden. All kinds of small fruits are plentiful and very good. *R. Mulner, Penrice Castle, Swansea.*

Pembrokeshire.—Apples in this district are almost a total failure. On May 19, when the trees were in full bloom (and splendid bloom it was), we had 7° of frost, followed by showers of hail and sleet, and high winds, with sharp hoar frosts, which had the effect of making this the most disastrous season for fruit ever experienced in this county. The only variety of which we have a crop is King of the Pippins and a partial crop of Keswick Codlin and Hawthornden. The above remarks apply to orchards. Trees on walls are with us fairly well-cropped. Pears and Plums were also very much damaged. *Geo. Griffin, Slebeek Park.*

IRELAND.

KILKENNY.—On fruit trees in general we had an abundance of blossom, but owing to the late frosts and heavy hail-showers experienced during the flowering period, Apples and Pears set badly, and are a light crop. Small fruits in general are plentiful, but about a fortnight later than the average of seasons. *William Gray, Woodstock, Inistioge, Kilkenny.*

CHANNEL ISLANDS.

JESEY.—The fruit crops, taken as a whole, are fair this season. Apples are but a partial crop; some of the early-flowering varieties show no evidence of fruit-bearing. The same remarks apply to Pears, the late varieties being most abundant. Plums and Cherries are abundant crops, although the climate and soil are not congenial to the growth of these fruits, being too moist. Peaches are a good crop, especially the later kinds. Nectarines are not so

abundant, and Apricots are comparatively scarce. Small fruits are neither so fine or so abundant as usual. Strawberries have been larger and in greater abundance than usual. Nuts are not grown, owing to the cause that applies to Plums and Cherries: the moisture of the climate induces growth, and not fruitfulness. *Chas. B. Saunders, St. Saviour's, Jersey.*

PEAS AT CHISWICK.

THE trial of Peas, which has already received adequate attention from the Fruit and Vegetable Committee, shows that in spite of the wonderful variety of Peas in existence, raisers still have faith in their capacity to produce better ones, or else believe that there is room to obtain Peas of higher quality. It may be after all a moot point whether we shall ever in Wrinkled Marrows attain to a higher excellence than some of our older Marrows gave. It may be, too, that to some consumers these exhibited too much of sugar and not enough of flavour; but, at least, myriads of our later-raised Peas have given neither sugar nor flavour, but simply size and abundance. It is true that the later-raised race of Peas do excel all others perhaps in prolificacy: we have them now so productive that it seems hardly possible to excel in that respect. Generally, if the pods are not too long, at least in many, the Peas are too large, and too hard and flavourless. No such Peas now should ever receive any award of merit. We want a rather dwarfier race generally, and especially we want more quality in our first early sorts. Not only in fact are these of indifferent quality, but they are poor podders and croppers. That there is hope of some improvement in the desired direction, some of the newer ones this year on trial at Chiswick show. A first early, really as early as is First Crop, Sangster's No. 1, Eclipse, or others having the height, cropping qualities, wrinkled peas, and general excellence found in Triumph, would indeed be an immense gain, and I do not see why it should not be eventually produced. It would have been more interesting at Chiswick could space have permitted many of the old sorts to have been grown also for comparison, but the members of the Fruit Committee are presumed to know all about Peas when they go to Chiswick. In any case, there exists the most anxious desire to do justice to all.

Sutton's Bountiful, somewhat like, but rather better than Harrison's Ameer, showed undoubted advance in size of pod as an early Pea, and a good type of what should now be set up as a standard, as the very small podded whites of the Sangster's No. 1 type hardly merit recognition. If Sutton's Bountiful, which is really a much finer and better Pea, should prove to be as early as Sangster's No. 1, a great gain will be found. There is one great thing to be said in respect to the Pea trials at Chiswick. It is that they are conducted without trade bias. Whenever a private trial ground is looked over where the firm has specialties or novelties of their own, somehow it always happens that the best doers are almost always of the firm's varieties, and thus some sort of suspicion is bred that all is not quite correct. At Chiswick, at any rate, we see every variety grown absolutely on its merits, and void of all trade preference. The committee examine the sorts free from all interference from interested people, and all exactly as their unbiassed judgments dictate. Of other varieties which met with full approval here, Duke of Albany and Telephone, older sorts; Eckford Essential, a tall and very fine Pea, already in commerce; Critic, of the Ne Plus Ultra type, tallish, and having fine green pods; Alderman, 6 feet, a great cropper; Chelsonian, also of the Ne Plus Ultra style, a very fine cropper, and of good quality; Marquis, another 6 feet Pea, but a grand cropper; Daisy, a capital 2 feet Pea; and the Echo, a really fine cropping dwarf Pea, standing about 2½ feet high, and full of capital pods, with Peas of excellent quality; Early Marrowfat, very dwarf; Optimum and Sutton's A 1, very early, but carrying single pods on the stems, only had two marks each. Some

of the points which threw otherwise fine-looking Peas were as follows:—Pods and Peas too pale in colour, presenting undoubted objectionable features in market sales. Want of flavour and rather hard Peas—a too common feature, and one which serves to properly discount more new Peas than any other.

We really do not want any Peas of indifferent quality, let their other merits be ever so great. As matters stand at present, it is not easy to set up a very high ideal at Chiswick, because the committee come to their task of awarding Certificates of Merit to Peas without first determining on what principles awards should be based. It would be well if some recognised high standard were set up, and that no Certificates of Merit should henceforth be awarded to anything which did not reach pretty closely to that standard. It cannot be doubted but that these awards carry with them a certain trade value. The Certificate of the Fruit Committee is equivalent to a trade mark. It is a stamp of excellence, and has its weight with the public; but when we have of all sorts of Vegetables, and Peas especially, such exceeding abundance, and of such general excellence, according to the old standards, it is time that a higher degree of excellence was looked for. We want fewer of very tall Peas, and if 4 feet were made the standard for tall ones, dwarfier ones being judged solely according to crop carried, we should do something to get rid of those ambitious sorts which seem anxious to touch the clouds, and need very costly stakes to support them. We have too many Peas of the curved-pod type, and want straighter-podded forms; these latter always open well, whilst the former are far too commonly puff-podded, and open badly. We want a rich, natural green colour in Peas more largely also, and we do not want large Peas, but rather long pods, straight, green, and handsome, well filled with quite medium-sized Peas, sweet, soft, and pleasantly flavoured. We have very abundant croppers already, but in new varieties, even with the best of flavour, good cropping would be an indispensable feature. In first early kinds, improved quality is sadly needed, and should be rigidly insisted upon. After all, during the past twenty years we have made very little progress in the production of really good first early varieties. *A. D.*

FLORISTS' FLOWERS.

BORDER PINKS.

On the occasion of the recent meeting of the Royal Horticultural Society at Chiswick, the Floral Committee inspected a collection of border Pinks, which Mr. Barron had secured. The inspection was done after the heavy rains and wind of the day before had disfigured the flowers. Still, the Committee were able to form a tolerably approximate estimate of their value as border flowers, and three marks, which is the Chiswick equivalent to an award of merit, were put to the following, viz.:—Mrs. Dark, one of the florists' laced varieties, of compact, robust growth, and very free blooming, the medium-sized well-formed flowers having dark lacings on the petal-margins; the calyx of this variety does not split quite so much as other laced varieties, and it is in all respects admirable for cutting from. Her Majesty, a large white variety, of robust growth, and very free, said to be a seedling from Mrs. Sinkias, but with the conspicuous fault of that variety of bursting its calyx badly. Beauty of Bath, said to have been sent as a white variety, but the flowers are of a pale pinkish-purple colour, with a dark centre; small well formed, very freely produced on vigorous-growing plants of compact habit. These came from Mr. F. Hooper, Widcome Hill Nursery, Bath. To Modesty, a very pretty, medium-sized, laced variety of the florists' section, white-laced, with pale rose; a capital grower, very fine and early, and good for cutting. This came from Mr. C. Turner, Slough. To white Pink Mrs. Lakin, pure in colour, with edges a little fimbriated, and slightly dark centre; a hardy, vigorous and free grower. On account of its purity

of colour, and not being much given to bursting its calyx, it is likely to become popular for cutting from. This came from Mr. J. Lakin, Temple Cowley, Oxford, who raised it from a laced variety; and to two Bedford-raised seedlings, sent by Mr. R. Dean, Ranelagh Road, Ealing; one named Charmer, having small, compact white flowers, with dark centre, and somewhat fimbriated on the edges; and Hetty Dean, bright rosy-purple, with dark centre, both of very dwarf, compact habit, and singularly free of bloom. It may be said of the two last, they are little given to split the calyx. *R. D.*

ANEMONES AND RANUNCULUSES.

These thrive in a cool moist season, and produce larger flowers than in a hot dry one, when the leaves soon become yellow, sometimes before the flowers generally and fully expand. Ranunculus roots will be ready to dig up before those of the Anemones, although the latter flowered first, and both should be taken up as soon as their leaves have turned of a yellow tinge; for if the tubers are left in the ground after this point is reached, they will start again, and be much injured. Spread out and dry the tubers in an airy room, not scorching in the sun. I may add that the dry tubers of both were frozen hard last winter, and were not injured. If seed is being saved of either, the bulbs cannot, of course, be lifted until it is ripe; but in this case, the tubers will not start to grow, as would be the case with non-seeders. *Jas. Douglas, Great Gearies.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

STRAWBERRIES.—Plantations that have cropped heavily for three or four years are seldom profitable enough to retain, unless the soil is deep and in good heart, when, if the routine pursued has been good, they will stand in fair condition some few years longer. The better practice, however, is to plant yearly in sufficient quantity to keep up the necessary beds, and destroy an equal area of old ones. Before planting trench the land some few weeks previously, so as to allow of its settling, as the plant does best on soil that is firm. If trenched in winter, and cropped with early Potatoes, all that will now be required is cleaning and levelling, and if light, trampling it firmly before planting. If plenty of rich rotten manure is put at the bottom of the trenches, the subsoil need not be brought to the top, and should not if it be of a poor character. Ground which has been prepared, and is waiting for the plants, should be hoed and made moderately fine on the surface. As soon as the runners have plenty of roots, remove them from the parent plants carefully, and plant without delay, putting some fine soil about the roots, and pressing the soil tightly about them. For the first year these plants may stand at 12 inches apart, each alternate one being removed after one year's fruiting. To secure good results the first year after planting, the runners must be got out as early as possible.

PLUMS AND DAMSONS.—In many orchards these trees are bearing heavily, especially Denyer's Victoria Plum, and the Farleigh Prolific Damson, and supports of some kind must be afforded the trees if the branches are not to break down. If the trees are not too high, a good way to support them is one that is much practised hereabouts: the number of branches on a tree is first counted, then as many pieces of string are fastened to the end of a pole, which is a little higher than the tree; the pointed end of this pole is then sunk into the soil close to the stem of the tree, and fastened to it, the strings are then attached to each branch and slightly drawn upwards; secured in this manner the branches seldom get broken. Plums on walls should have the young wood shortened back, and enough laid in all over the tree to bear fruit in two years' time. It is from this two-year-old wood that the finest fruits are produced.

BUDDING.—This operation should be pushed forward—the bark of Peaches, Plums, Cherries, Pears, Apples, Quinces, Medlars “running” well. Those who are capable of budding Roses successfully can bud fruit trees, but care ought to be taken to employ suitable stocks in vigorous health. The grafts put on in the spring will now stand in need

of support, which is best afforded by fastening them loosely to thin sticks stuck into the ground near the stocks. *H. Markham, Mereworth Castle, Maidstone.*

FRUITS UNDER GLASS.

POTTING STRAWBERRY LAYERS.—Many of the earlier layered runners will be in a fit state to pot if these have been detached from the plants about one week and placed on the north side of a wall or otherwise shaded, and syringed several times daily to prevent their flagging. Pots and soil should be got in readiness, so that no delay will occur when the job is started. Stand the plants when potted, where they will stand whilst growing, and choose a hard coal-ash bottom to stand them on, and afford them ample space for growth. Endeavour as far as possible to secure plants with one crown, but this is difficult with some early varieties, which commonly have divided crowns which give only small fruits, although even these may be reduced in number. When potted, Strawberry plants are often stood at the sides of gravel walks with nothing under them to prevent the ingress of worms, and much mischief is done—a strip of wood or slate should be put under the pots. Firm potting should be the rule, and the watering carefully done, affording clear water only till the new roots get round the sides of the pots; damp them over slightly in the evening when the days are sunny, and cut off all runners as fast as they show. Prepare for the next season's supply by planting runners when ready, on trenched, and well-manured ground. I plant in rows 2 feet apart, and 12 inches apart in the rows, and cut out each alternate plant when the runners have been secured the following season. It is advisable if ground can be spared for the purpose, to plant a few more rows than are really wanted, as these plants will lift readily in March, and if fruit be scarce, they may be forced gently in ordinary cold frames.

FIGS.—The earliest crop of Figs is now finished, but the trees will continue to fruit if they are allowed to do so, but this will be at the cost of next season's early crop, so that it is better economy to stop the formation of fruit, and ripen the wood by free exposure to the air, all useless wood being cut out to let light into the trees. If the Figs are in pots or tubs, remove them to a sunny border and plunge the pots. Figs in borders indoors must not suffer for want of water and manure-water. I find that a top-dressing of fresh cow-manure at this date is of great benefit to the trees in the early house. The syringe must be plied vigorously, so as to maintain healthy foliage; and, if scale be troublesome, sponge the leaves with soft-soap and water, and use a brush to get at the insects in the crevices of the bark. Trees having ripe fruit hanging on them will now require more ventilation and less moisture in the air. Late Figs should not want for water, or stimulants to growth; the shoots should be thinned out, and a mulch of manure put on the root.

CUCUMBERS.—It is now time to prepare for winter Cucumbers, and seeds of Syon House and Telegraph should be sown in small pots, and grown sturdily and free from all insects, shifting them into 6-inch pots if the house is not ready for them; pot-bound plants often split at the base of the stem, and fall a prey to canker. This lot of plants is generally more difficult to manage than those which are grown in the warmer season, so that every care should be afforded them from the beginning. For winter Cucumbers it is better to have the plants in pots; and if beds of soil are used, they should not be wide or deep. Plants may still be planted for late supply, and these may be fruited heavily; not so the winter fruited, which should be encouraged to grow and cover the trellis with bine. I would here remark on the prudence of thoroughly cleaning the winter Cucumber-house before putting a plant into it.

ORCHARD-HOUSE.—Trees in pots should be abundantly supplied with liquid manure, a sharp watch being kept for red-spider. Syringe the trees heavily when the last fruits are gathered, and add flowers of sulphur or soft-soap to the water used, if spider is present. Some of the early fruiting trees may be removed to sunny positions out-of-doors, and the pots plunged in coal-ashes or soil, with a bit of tile or slate under the hole in the pot-bottom. Cut out all weak shoots, or such as have borne fruits. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

SOWING CABBAGE SEEDS.—A piece of ground should be prepared for sowing forthwith Cabbage seed for the main crop of Cabbages for next year in

late parts of the country; but for the generally warmer south the second week in August will be soon enough. I make two sowings, one on or about August 5 and another about the 19th, the latter answering my purpose better than the first, the garden being a warm one. If good seed be obtained there will be less fear of the Cabbages bolting; not less than four varieties should be grown, and those which I would recommend for trial by those growers who may not be acquainted with the varieties, are Sutton's Flower of Spring, Earliest, and All Heart. I trust to these varieties and find them to be the best that I can grow here, although they are not recommended by Messrs. Sutton & Sons for sowing at this season. Not half a dozen of any of these varieties bolted this season. The first two may be planted 12 inches apart, but All Heart should be allowed 18 inches. Ellam's Early and Mein's No. 1 are excellent Cabbages, and may be planted quite as close together as the first two above named.

Sow the seeds thinly in shallow drills, made 9 inches apart, on well-tilled beds, and cover lightly. Label each variety, and it is advisable to make a note of the order of sowing in case the labels should get removed; put a net over the bed to protect the seeds from the birds, or, in lieu of nets, cotton thread may be twined over them.

A bed of the Red Cabbage should be sown at the same time. Dwarf Blood Red is an excellent one, of dwarf and compact habit, and the earliest Red Cabbage that has come under my notice.

ENDIVES.—Sowings should again be made of the round-leaved Batavian, Incomparable Green, and moss-curl varieties. Heavy soils are not suitable for growing Endive for winter, and the plants are liable to turn out badly; but the land may, nevertheless, be made suitable. An open situation should be chosen, and a shallow hole of the size of the bed dug out, some kind of a foundation of rough garden rubbish put into it to act as drainage, and over this place sandy soil 1 to 2 feet thick, which will form a bed for the plants, raised somewhat above the general level of the garden. Such a bed will cost but little, and if it be annually manured, and dug over as occasion requires, it would supply good Endive in winter, and salads, &c., in summer. Where the staple is of a light and dry nature, no such bed is needed. Sow the seeds very thinly in shallow drills made at 15 inches apart, and if the weather be warm and dry, water the drills before sowing. Thin out the plants as soon as large enough to 12 or 14 inches apart, and plant the stronger thinnings on a south border, to be lifted for filling cold frames in the autumn. Endive should never suffer from drought, and it should receive occasional waterings with liquid manure.

LETTUCE.—More seed may be sown, the produce to be transplanted into cold frames for early winter supply. Where these frames can be spared at this season, it is better to sow the seed in them, the soil being lightly forked over and made firm and level, the seed being sown thinly in drills 9 to 12 inches apart, according to the size the variety attains to. There is no necessity to make use of the lights, unless it be to protect the plants from heavy rains. Lettuces treated in this manner are better than transplanted ones, no check being given them.

SEAKALE, ETC.—The flower-heads should be cut off at the level of the ground, inattention to this operation impoverishing the plant and causing loss of crowns. Keep Asparagus beds free from weeds, and if Lettuces have been grown on beds newly-planted, clear off all the plants before they run to seed. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

EAST INDIA HOUSE.—Remove to a cooler house out of strong heat, Dendrobiums, when the new growth is finished, or they will break from the base, which is not of much matter early in the year, or up to midsummer, as then there is time to ripen the growth. The evergreen species, *D. thyrsiflorum* and *D. densiflorum*, I find are very apt to break if left only a day or two too long. An early vinery, after the fruit is cut, will suit these Dendrobiums very well. Many of the earliest flowering Dendrobies, as *D. heterocarpum*, *aureum*, *Findleyanum*, *nobile*, and *Wardianum*, will be those which are ready for removal. Another plant which does well and blooms freely when treated in the same manner as these Dendrobiums, is *Laelia majalis*. I failed to flower this plant for years, till I gave it a long rest and a place in the warmest house when in growth. *Vanda teres* and *V. Hookeriana* should be repotted,

if this be considered necessary, as soon as the flowers are past their best. I have previously described my method of growing both of these plants, and the position that they should occupy the whole year, excepting when in flower—that is, to stand them with the flowering Cattleyas. A small brown scale infests these species of Vandas, which if allowed to remain soon deprives them of the green colour in their leaves. Thrips are also very troublesome, and I find it necessary to fumigate with tobacco twice a week. These fumigations should not be very powerful. Ventilation needs to be well attended to or "spot" will be very likely to make its appearance on Phalenopsis; moreover, the rotting of the leaves of these plants is often brought about by a deficient circulation of air.

CATLEYAS.—Plants of *C. Trianae*, which flowered early, and whose new growth is well advanced, will now give some idea of what they are likely to be at their flowering season. *Laelia anceps*, both red and white varieties, are already showing their flowering spikes, and may be watered abundantly, and if the sphagnum moss is growing well, the young roots will ramble over and through it very fast; if the plants are suspended from the roof, they should be syringed freely in the morning—the plants getting dry again before night-time. The present comparatively quiet time allows the Orchid grower to examine his plants, and ascertain their precise condition. Woodlice, slugs, and cockroaches must be searched out nightly by the aid of a lantern; this is work which is apt to be neglected now that the evenings are so long. *A. G. Catt, Parkfield, Hallow, Worcester.*

PLANTS UNDER GLASS.

POINSETTIA PULCHERRIMA.—Young plants raised from cuttings taken early in the month of June last, should be potted into their flowering pots, and if large heads of bracts are looked for, the plants should not be stinted of rooting space. If these young plants are strong and healthy, and have made roots freely, 8-inch pots will not be too large for them. Keep them in a pit of moderate warmth, and close up to the glass, so as to prevent the plants becoming drawn, or losing their lower leaves. Plants which bore heads of flower last season and were cut back previous to starting them into growth, and partially shaken out of the soil in which they had grown, and placed in larger pots, should not carry all the shoots that are made, but these ought to be reduced to half a dozen, or fewer, or the bracts, which are the beautiful part of the head of flowers, will be small. These plants will require liquid manure afforded them regularly, and also sufficient heat to keep them growing freely. Examples which were planted out in the borders of warm houses should be frequently supplied with liquid manure.

CYCLAMENS.—Young plants which should bloom during the next winter and spring should be moved into their flowering pots without delay, and in most cases, if these are 5-inch pots, they will be found to be sufficiently large. A good compost for them consists of loam, leaf-mould, sand, and dried, decayed cow-dung, and great care must be paid to the drainage. In potting, make the soil of moderate firmness, and place the potted stock in a cool pit or frame well up to the glass, which will preserve the leaves from lengthening, and keep the frame or pit rather close for a few days, that is until fresh roots are made. Syringe the plants freely in the afternoon at closing time if the weather is sunny; and keep them quite free from red-spider and aphides, either of which, if allowed to go unchecked, will hinder growth and spoil their flowering.

PELARGONIUMS.—Any of the show varieties, which bloomed early in the season and were afterwards stood out in the open to ripen their wood, should be cut in, to within one or two buds of the point to which they were previously cut-back, standing them in a cool frame or turning them on their sides at the foot of a wall till they break. Late bloomers may now be stood out in the open, it being undesirable to allow them to bloom any longer. The present is a suitable time to put in Pelargonium cuttings which should be taken from the extremities of the shoots which have been cut from the plants that have flowered and matured. Each cutting should have about three or four joints, and if any variety be found in insufficient numbers the hard matured wood may also be utilised. Place the cuttings singly in 3-inch pots, in a compost consisting of loam, leaf-mould, and sand; standing the pots in a cold frame or in the open air, fully exposed to the sun.

The Fancy Pelargoniums will not require to be cut

in so close as the show varieties, but four joints of this season's growth should be left, or the break of the young shoots will be very indifferent.

Before cutting back any of these plants, the soil should be almost dry, as there is a great danger of the roots rotting. After the fancies are cut back they stand them in a cold frame, so as to prevent the soil becoming wet before the shoots break, the roots being very susceptible of injury from too much moisture at this stage. It will help the plants to break freely if the syringe be used lightly overhead on fine afternoons, and the frame kept close. *R. Milner, Penrice Castle, Swansea.*

THE FLOWER GARDEN.

DAHLIAS.—The single and Cactus Dahlias have been regarded for some years past as showy and suitable subjects for planting in mixed beds of good size in the flower garden, and as masses in shrubbery and other borders; and owing to the beauty, diversity and richness of their colours and their usefulness from the decorative gardener's point of view, they have in a great measure supplanted the double varieties in general esteem. The Tom Thumb section of them raised by Mr. T. W. Girdleston, and now being distributed by the Messrs. J. Cheal & Sons, Crawley, bids fair to surpass in effectiveness, utility, and easiness of production such old flower-garden plants as the Pelargonium, Calceolaria and Ageratum. There can be no doubt respecting the effect produced by planting the Tom Thumb section in masses of either separate or of two colours, planting some of the taller growing varieties in the middle of the beds, and the dwarf ones round the outside. The plants of the twelve varieties composing this section, and which doubtless will be increased as time goes on, range in height from 9 inches to 15 inches, and one (Maud) is 18 inches high. The colours, distinct, being bright and dark scarlet (Midget and Bantam), light orange (Miss Grace), deep mauve (Pearl), bright yellow (Miniature), and maroon (Bo-Peep), with flowers of 2½ inches to 4 inches in diameter. Some of the Single and Cactus varieties have foliage and blooms very useful for cutting. Foremost among these are Constance, pure white; Mrs. Hawkins, sulphur colour; Juarezii, crimson; Paragon, rich velvety maroon, with purple at the edge of each petal; Mrs. Cleveland, terracotta red, shaded with pale cerise; and Excelsior, white, with broad margin of lilac. The plants, now in full beauty in many places, must have the small shoots kept well thinned out, and the principal ones secured to the stakes. In order to secure fine blooms the plants must be kept uniformly moist at the roots, and the light let well among the shoots, and where mulching will not be objectionable, it should be done at once. I am only referring to decorative blooms, because for special purposes only a limited number of blooms should be permitted to develop, supplies of liquid manure being given at the roots to increase the size of the blooms. Earwigs are sometimes very destructive to the Dahlia, eating into the florets. A flower-pot half filled with moss, or a Bean-stalk placed among the plants, will trap them most surely, the traps being examined daily, and the insects destroyed.

BORDER CARNATIONS.—Beds of the old dark-coloured Clove Carnation have greatly benefited by the rain which fell at the beginning of the past week, and having been recently disbudded, the plants are now flowering freely. It is not yet too late in late districts to thin out the flower-buds of Carnations, the buds on either side the crown or central bud being removed, as it is necessary to take 2 inches of the flower-stem when the flowers are cut; moreover, these side buds seldom develop into passable blooms. In order to prolong the supply of Cloves as long as possible, it will be necessary to remove the crown flower-buds from some of the plants, allowing the two side ones to develop, which they will do, later. Support the stems as advised in a previous Calendar.

VASE, BOX, AND POT PLANTS.—In most flower gardens well-filled vases and specimen Pelargoniums in boxes and large pots are stood about at intervals, and contribute largely to the general effect. These should receive due attention in the matter of laying on an occasional surface-dressing of some kind of plant manure; and the watering at this season should be frequent and liberal, as the plants benefit but little from rain owing to the mass of leaves preventing any of it reaching the soil. Pinch out the points of very strong shoots, and remove decaying leaves and over-blown flowers. *H. W. Ward, Long-ford Castle, Salisbury.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY, AUG. 3. Last day of Southampton Horticultural. Northamptonshire Horticultural (two days). Beddington (near Croydon) Horticultural.

TUESDAY, AUG. 4.—Mansfield, Notts, Horticultural.

WEDNESDAY, AUG. 5.—Ancient Society of York Florists.

SALE.

FRIDAY, AUG. 7. Orchids, including some novelties, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.3.

What is a Seedling Plant? VAGUENESS in the wording of schedules is a fertile source of trouble and unpleasantness, the more to be regretted, as much of it might be prevented by previous arrangement even if purely arbitrary. In the present case, as in so many others, the vagueness arises from the fact that the word "seedling" has in daily use more than one signification. Botanically a seedling ceases to be fitly so called after the full expansion of the seed-leaves, and prior to the formation of any new leaves or shoots. So limited, the seedling stage comprises those parts, and only those parts, which were originally contained within the ripe seed. The seed-leaves, for instance, may be much larger after germination, but they are the same organs that were wrapped up within the seed. Of course there are botanical minutiae which, as in the case of most natural objects, vitiate this definition, but in natural history mathematical accuracy is unattainable, and for all practical purposes the above statement is accurate enough.

When we look upon the subject from a horticultural standpoint, we get, as usual, into a chaos of uncertainty and varied application. Some say a seedling remains a seedling so long as it has not been propagated; others so long as it has not been "let out," or put into commerce. One correspondent asks, "Is a Gloxinia raised from seed in 1888, considered a seedling in 1891? Has it not passed from the stage of seedling after the first year's growth and rest?"—

thus making one season's growth the touchstone. Another correspondent is of opinion that a plant raised from seed is always a seedling, no matter to what age it attains, as it is different from a plant grown from cuttings, layers, buds, or grafts. But if this view is to be taken, the old Oaks and Beeches in Windsor Forest are still seedling plants. Fine babies these! We should have thought they had cast their milk-teeth long ago!

The term seedling is also used by gardeners in a special sense to indicate a variety or a variation raised from seed. In such a case we say seedling for brevity sake, but it would be preferable to say always seedling variety. However these are matters of custom, concerning which people vary very much in their usage, but with a view to elicit the views of our correspondents, and in the hope of being able to formulate something more definite than we have at present, we ask, "What is a seedling?"

ORCHID BASKET PRESENTED TO H.I.M. THE EMPRESS OF GERMANY.—Never on any occasion when a foreign potentate has visited these shores has such a group of Orchids been seen as that presented at Buckingham Palace on July 10 to the Empress of Germany by Mr. F. SANDER, of St. Albans, and of which we give a supplementary illustration. It consisted of the rarest and most costly flowers in the collection at St. Albans. It was a work of artistic merit, and was so highly appreciated that the Empress ordered the basket to be taken from room to room during the remainder of her stay at Buckingham Palace. Mrs. WILLS, of the firm of WILLS & SEGAR, was deputed by Mr. SANDER to arrange the flowers, giving the final touches to what was certainly the most magnificent basket of Orchids ever presented to any royal lady visiting these realms. Among the flowers employed were numerous Cattleyas, such as Mendelii in variety, Sanderiana, chrysotoxa, Gaskelliana, Leopoldii, all cut with pseudobulbs and leaves; Oncidium crispum grandiflorum, Gardnerianum, macranthum, undulatum, Loxense; Odontoglossum crispum, Peacatorei, hystrix, Wilekanum, Harryanum, Schroderianum, vexillarium; Aerides Leonis, Sanderianum and Lawrenceanum; Cypripedium caudatum, Schroderae, Rothschildianum, Sanderianum; Epidendrum Frederici Gulelmi, vitellium majus, Wallisii; Dendrobium formosum giganteum; Cymbidiums, Thunias, Saccolabiums, Masdevallias, &c. The photograph whence our illustration was taken was executed by Mr. VERNON KAYE, of Onslow Place, South Kensington.

FATAL STORM.—The Rev. Mr. WALLACE, of Bromley, was lecturing on bee-keeping at the flower show at Lacy Green, near Aylesbury, when a flash of lightning struck the speaker and several of the by-standers, some of whom were assisting him. Three men were killed, three, including Mr. WALLACE, much injured, and others less severely hurt. It is not often a flower show has such a calamitous ending.

COUNTY COUNCILS AND BEE-KEEPING.—The Essex County Council, at their quarterly meeting at the Shire Hall, Chelmsford, on the 7th ult., recommended:—"That a sum not exceeding £500 be granted to the Joint Committee (composed of six members respectively of the County Council and the Essex Field Club), for the purchase of apparatus and diagrams, which are to be the property of the Council, and that a sum not exceeding £100 be granted to the committee for the storage and carriage of such apparatus and diagrams; that a sum not exceeding £50 be granted to the same committee, to be expended in lectures under the direction of the Essex Bee-keepers' Association; and that local committees throughout the county, especially in rural districts, be recommended to make application to the said Joint Committee, or

the Essex Agricultural Society, for aid in lecturers or teachers, obtaining apparatus or materials, the conducting of examinations, and seeking help and guidance generally." The Northamptonshire County Council has also voted the sum of £25 towards the funds of the North Hants Bee-keepers' Association, to be spent in instruction and demonstrations in bee-keeping within the county. It being an accomplished fact, that bee-keeping has been found a fitting subject for technical instruction, there is now a prospect that the art will attain such additional importance as presently to rank as a recognised British industry, and that we shall not long be behind Germany and other countries in this respect. If other councils follow suit, and the system of instruction can be made successful, it will be a means in the near future of so increasing the number of honey producers, that the large sum annually expended on imported honey may be very considerably reduced. A healthy and interesting occupation will be assured to many, if a proper system be adopted, and the necessary attention given, and one that can be worked profitably either alone or in conjunction with other undertakings in suitable localities at home. The following are the members of the Joint Committee for Technical Instruction of the County Council and the Essex Field Club. Nominated on behalf of the County Council:—Mr. E. N. Buxton, J.P.; Mr. E. A. Fitch, F.L.S.; Mr. J. H. Burrows, Mr. S. W. Squier, J.P.; Mr. F. West, and Mr. W. B. Whittingham. The Essex Field Club members are:—Professor G. S. Boulger, F.L.S., F.G.S., Professor of Botany and Zoology, City of London College; Mr. F. Chancellor, J.P.; Professor R. Meldola, F.R.S., &c., Professor of Chemistry, City Guilds Technical Institute; Sir H. E. Roscoe, M.P., LL.D., &c., one of the authors of the Technical Education Act, and Honorary Secretary to the National Association for the Promotion of Technical Education; Mr. F. W. Rudler, F.G.S., Curator of Museum of Practical Geology; and Mr. J. C. Shenstone, M.P.S., F.R.M.S.

STRAWBERRY, LAXTON'S NOBLE.—We find this novelty highly spoken of in Germany as a market fruit. In the Leipzig market it obtained the highest price this season. It is found to bear carriage for long distances with less injury than any other variety; moreover, the plant is less liable to be damaged by the hard frosts of that country, and the berries stand wet weather for longer periods without rotting or becoming spotted. It crops abundantly, and the flavour is said to be mildly vinous, and without the acidity usual with large-fruited Strawberries.

CONSETT PARK.—On Saturday, July 11 last, the town of Consett, in Durham, celebrated the opening of its new public park, which was performed by Mrs. DALE, the wife of Mr. D. DALE, the Chairman of the Board of Directors of the Consett Iron Company, who have not only presented the land, amounting to over 30 acres, to the public, but have been at the sole cost of laying it out as a park and recreation ground. This land was for many years little better than a waste, the upper part of it being a receptacle or "tip" for all kinds of rubbish and debris, and it was altogether one of the most unpromising looking places for a park. The firm of Messrs. J. Ronson & Son, Hexham, supplied the designs for the laying-out of the park, and superintended the execution of the work, besides supplying the trees and shrubs with which it is planted. One of the principal difficulties which had to be overcome was the selection of trees and shrubs which would thrive at this high elevation, and withstand the smoke and fumes from the chimneys of the Consett Iron Works, which are close at hand. The selection has been very carefully made, and has been thoroughly successful. Over 40,000 trees and shrubs have been planted. The park stretches the whole distance between Blackhill and Consett, and has an entrance at the north end of St. Aidan's Street, Blackhill, and another at the south end, for

TROPHY OF ORCHIDS.
PRESENTED TO H. I. W. THE GERMAN EMERALD
BY MESSRS. GANDER & CO.

the convenience of the inhabitants of Consett. Entering by the approach from Blackhill Railway Station, the road traverses, with many graceful curves and sweeps, the whole distance from Blackhill to Consett. It is laid with 12 inches of broken rubble, and finished with red ash. There is a wide margin of grass on each side of this and all the other roads. The whole of the land planted has been trenched from 18 inches to 2 feet deep, and a dressing of 40 tons of manure per acre was laid upon the surface and dug in, with evident benefit to the subjects planted. There are two tennis-courts and a large bowling-green in the park. *Local Paper.*

PHORMIUM TENAX.—Regarding the flower-spike of this plant exhibited at the last meeting of the Royal Horticultural Society, and which was briefly referred to in the last issue of the *Gardeners' Chronicle*, Mr. JAMES BATEMAN, F.R.S., who exhibited it, informs us that it is the only one he has ever seen in flower, either in his own most interesting garden at Worthing, or in the gardens of other people. Mr. CARRICK MOORE, to whose kindness Mr. BATEMAN owes the plant which has now flowered, says that it never flowered with him, either at Brook Farm, Cobham, or at Corswall, Wigtonshire, although his neighbour Lord STAIR has a lake near Stranraer which is fringed for miles with flowering masses of the plant. Can it be that it prefers a "whiff" of sea air?

PYRENEAN PLANTS.—Dr. BLANCHET has published a Catalogue of the Vascular Plants of South-Western France, comprising the districts of the Landes and the Basses Pyrénées. It forms a pamphlet of 172 octavo pages, and may be obtained from the Imprimerie Lasserre, Rue Gambetta, Bayonne. The catalogue is arranged according to the Flora of GRENIER and GODRON, and consists of a list of names and localities. This little work supplies a need greatly felt. There has hitherto been no good local botanical guide for visitors to the Landes and the Basses Pyrénées. Bentham's *Catalogue*, published in 1825, is long since out of print. There is, indeed, the larger work on the botany of western France by LLOYD in its latest edition. For the higher mountains, Mr. PACHE had done something in his guide-book; there were also some good local botanists, as PHILIPPE of Bagnères de Bigorre, and the MM. FROSSARD, father and son. M. BORNÈRES, the schoolmaster botanist at Gèdre, and a few others, supplied a certain amount of assistance. In the Landes there was the *Essai d'une Chloris*, by THORE, and some papers by a very zealous botanist, DARRACQ of Bayonne; but all these were incomplete, and it is only since the publication of LACOIZQUETA's two works, *Catalogo de las Plantas del Valle de Vertizcarana* (Madrid, 1885), and *Diccionario de los nombres Euskaros de las Plantas, con los Vulgares, Castellanos y Franceses y científicos Latinos* (Pamplona, 1888), for the southern side of the mountains of the Pays Basque, that any real assistance has been given to amateurs. Dr. BLANCHET does for the northern slope of the Western Pyrenees, and its adjacent plain, what LACOIZQUETA has done for part of that of Navarre. His book, too, has the advantage of being written in French, a language more generally understood than Spanish. Dr. BLANCHET's list is especially interesting, from the details given on the accidental invasion of foreign plants on ballast-heaps, &c., the way in which they spread and establish themselves, sometimes permanently, sometimes for a few years only. The Catalogue does not profess to be exhaustive. Part of the district Dr. BLANCHET has long studied; for the rest, he has made good use of the materials supplied by others. In some cases he is supplemented by LACOIZQUETA; but every amateur and botanist will be grateful to him for supplying so great a want, and supplying it so well. In the present volume we note twenty-two species of Saxifrage, eighteen of Sedum, four of Sempervivum, while under the head of Amaryllidæ eleven species of Narcissus with certain varieties are mentioned. A

note tells us that these plants, till lately, formed a special ornament of the country around Bayonne, but are rapidly being exterminated. "Elles sont depuis quelques années l'objet d'un commerce effréné, qui a pris les proportions d'un véritable vandalisme, d'une dévastation. C'est par milliers que chaque année on les expédie au-delà de La Manche, non cueillies mais arrachées sans pitié et par conséquent désormais perdues. Les pourvoyeurs font leur malheur eux-mêmes et ne le comprennent pas."

MR. A. DEAN.—In reference to the paragraph inserted in our issue for July II, concerning Mr. A. DEAN's retirement from the management of his brother's business at Bedford, Mr. RICHARD DEAN requests us to state that he still carries on his seed business at Bedford as heretofore.

FOR SALE!—Two remarkable estates are now in the market, one in a beautiful suburb of greater London, and interesting as having been for a time the residence of the late Emperor NAPOLEON—we allude to Camden Place, Chislehurst, the freehold of which is to be sold by Mr. WILLETT, 2, Sloane Gardens, and to Saltwood Castle, near Hythe. This last is remarkable for its old castle, almost an exact copy of the noble West Gate of Canterbury, and built in the fifteenth century by the same architect. It is in a beautiful country, a short distance from, and in full view of, the sea. The old castle has recently been restored, so as to adapt it for modern requirements, and the situation is so sheltered and the climate so mild, that a great scope is afforded to the landscape gardener and lover of plants. Messrs. HAMPTON & SONS, Pall Mall, are the agents for the sale.

MEADOW HAY.—M. A. CHATIN, treating in the *Comptes Rendus* of natural grass lands and the best methods of forming them, says that the following grasses should be rejected:—1, coarse-growing: *Festuca heterophylla*, *F. pratensis*, *Avena elatior*, *A. pratensis*, *Bromus erectus*, *Dactylis glomerata*; 2, species which grow too early in spring, e.g., *Anthoxanthum odoratum*, *Holcus lanatus*, *H. mollis*, *Phleum pratense*, on the other hand, which, though later in growth, is yet not dry and hard at the time of mowing. The grasses principally selected by M. CHATIN are *Avena flavescens*, *Briza media*, *Cynosurus cristatus*, *Alopecurus pratensis*, *Agrostis vulgaris*, *Festuca ovina*, *duriuscula*, and *rubra*; and though rather early, *Poa pratensis* and *P. trivialis*. To these M. CHATIN adds various Clovers, such as *repens*, *Medicago lupulina*, *Lotus corniculatus*, various species of *Galium*, which add honey-like fragrance to the hay; *Salvia pratensis*, and *Centaurea jacea*. It should be remembered that M. CHATIN's meadows are situated in the Department of Seine and Oise, but the principles of selection are the same, whatever the country or climatal characters.

"KEW BULLETIN" this month is devoted to an account of the Gold Coast Botanical Station, in charge of Mr. CROWTHER at Aburi. One of the main objects is to induce the natives to cultivate certain plants of economic value, and not confine themselves to the mere collection of wild products, which are showing signs of exhaustion. Aburi, it appears, is at an altitude of 1400 feet, and the shade temperature does not exceed 88°, with a rainfall of 60 inches. Speaking of the Bahamas, the *Bulletin* notes the great importance of the plantations of the so-called Sisal Hemp or Agave rigida, var. *Sisalana*. Jaborandi (*Pilocarpus pennatifolius*), a drug used in medicine as a diaphoretic, &c., has been found in Paraguay, as well as in Brazil, but the southern variety is found to be less effective.

POTATO EXPERIMENTS.—The Royal Agricultural Society is carrying out in six separate districts of the country experiments on plots, each 3 acres in extent, with sulphate of copper. One acre is to be treated early, to prevent the disease if possible; 1 acre later on, when the disease has become apparent; and 1 acre to be untreated. We are heartily

glad to see some steps at length taken in the matter. For the sake of the farmer, we trust the Royal Agricultural Society may have the same experience as the Royal Horticultural Society, a committee of which for two or three years undertook trials of various kinds, and prepared elaborate records, but the amount of disease which appeared was so small that the experiments were relatively valueless. An impromptu experiment in a subsequent year, however, proved most instructive. We perceive some of our contemporaries are blaming the Royal Horticultural Society for not taking up the subject; but it must be remembered that the Royal Agricultural Society can effect this matter much more readily and extensively, having a paid consulting botanist to direct and overlook the experiments, and a sum of £300 allowed towards the expenses. The former experiments at Chiswick involved a severe tax on the time and labours of the working members of the committee, who did not even receive the thanks of the Society for their labour. We regret to record the appearance of the disease at Chiswick and elsewhere, but so far not to a great extent.

A CLIMBING ROSE.—One of the most beautiful of climbers, says *Garden and Forest*, is the so-called Prairie Rose (*Rosa setigera*), which is now covered with flowers after the general Rose display is over. This plant is much more beautiful than the double varieties. It is a free grower, and will cover easily a hundred square feet of trellis with its bold healthy foliage, which is as clean and free from fungi and insects as that of *Rosa rugosa*. The large rose-coloured flowers, with conspicuous clusters of yellow stamens, come in corymbs, and keep opening one after another for several days.

ILLUSTRATIONS OF THE FLORA OF JAPAN.—This consists of a series of lithographic plates illustrative of interesting Japanese plants. In the numbers before us several species of *Goodyera* are figured. The figures are so accurately drawn that they will be very serviceable to botanists. The work is published by Mr. TOMITARO MAKINO. The text is in Japanese, but the names are fortunately repeated in Latin.

THE SOCIETY OF AMERICAN FLORISTS is to hold high festival at Toronto from August 18 to 20, and will, in all probability, be attended by large numbers of the horticultural trade in Canada and the States. All the "live men in the trade" will be there, says the *American Florist*, "and they are the men who are quick to discern merit in anything that really possesses it." True enough, from the point of view of trade and fashion.

CARBONATE OF COPPER FOR THE TOMATO FUNGUS.—Professor BAILEY recommends a mixture thus composed:—Dissolve three ounces carbonate of copper in a quart of liquid ammonia; of this, two fluid ounces are mixed with two gallons (a pail) of water when required.

INSECTS AND FUNGI.—We are glad to see that in the *Journal of the Royal Agricultural Society*, dated June 30, is a useful summary as to the best methods of prevention of these pests from Mr. WHITEHEAD. It is a cause in which the more recruits the better.

CHICAGO EXHIBITION.—This promises to be a "big thing." It is to be held in Jackson Park, an area of 586 acres on the banks of Lake Michigan; over 100 acres of this space will be roofed over! The space allotted to horticulture is 6 acres, that to agriculture 15 acres. So Protectionist a nation as the United States can hardly expect, it would be thought, to induce many foreign exhibitors to present themselves or their goods.

ROTHAMSTED LECTURES.—One of the provisions of the Lawes Agricultural Trust, is that a course of lectures shall be given in the United States on the Rothamsted experiments. At the next annual meeting of the Association of American Agricultural Colleges and Experiment Stations,

Mr. ROBERT WARINGTON will deliver six lectures. The first lecture, to be illustrated by magic-lantern slides, will be "On the Rothamsted Station."

THE WINTER.—At the high tide of summer we are apt to forget what the winter was like. It may, however, be useful to record that whilst the average of foggy days in London during winter is twenty-five days, in the winter of 1890-91 we had no fewer than fifty. The rainfall was also less than half the average.

"LES ANTHURIUM."—M. E. BERGMAN has published a second edition of his list of species of Anthurium, comprising no fewer than 180 species and varieties, and has added directions as to their culture.

CATTLEYA BRYMERIANA.—We are informed that the statement that *Cattleya Brymeriana* is flowering for the first time in Belgium in the establishment of M. Peeters, is inaccurate, inasmuch as the species in question flowered at the Horticulture Internationale for the first time in 1877, and has since continued to bloom there every year.

HOME CORRESPONDENCE.

TRANSPLANTING EVERGREENS.—After the experiences of last winter, few planters will defer the removal of evergreens till September and October. It will be more prudent to start operations in August, choosing, if possible, a showery time. The great thing to be particular about is to dig them up and replant again quickly, and to do this it is necessary to have men used to the work, and well directed, and to get the holes dug out before lifting any shrub, that it may go at once to its place, and have its roots covered up. Before the final filling is done, it is important to afford water in quantity, and with such force as to flood the hole, and fill in with soil every crevice about the roots, which will almost insure the plants living. It is also of great assistance to the plants, whenever the weather is dry, to syringe the foliage night and morning, using, if possible, the garden engine, or a hose. To be successful in transplanting at this season, it is hardly necessary to say that the evergreens must be on the spot, and not have to come from a distance. If the planting cannot be carried out during August and September, it is better to wait till April, when most evergreens can be removed with safety; but if the young growths are hard, and weather favourable, early autumn is the time, and the finishing up can be carried out in the spring. J. S.

LABELS FOR GARDEN PLANTS.—Reference to the label question on two occasions lately in the *Gardeners' Chronicle* induces me to say that in my opinion there is no label for use out-of-doors that approaches in efficiency those made of zinc and properly written upon, when it is necessary to consider the combined qualities of durability, cheapness, and such a degree of conspicuousness or inconspicuousness that they are neither obtusive nor difficult to find and read when wanted. Labels come and labels go, in various forms, but when the above qualities are in question, zinc labels have long reigned, do reign, and probably will reign for a long time to come. I send you an example that has been in use all but ten years (the date is on the back), and which is not a selected specimen, but one that chances to be out of use by the felling of a tree. According to all appearance, it would, I think, be as good practically in ten years' time as now. [The writing as legible as the day it was written. Ed.] For the mere preservation of names zinc labels are not easily surpassed for use under glass, though it is difficult, more especially in warm houses, to keep the surface of the label in clean condition. At the same time, the worst label that could be found, among those that have been properly treated, could be read easily by any one familiar with plant names. The want of a fixture to the ground would be a fatal objection, in almost all gardens, to the labelling mentioned by "F. O." In some gardens useful results might be got by numbering in correspondence with a book of entries, say by impressed numbers on zinc supported on wire. By the way, I have heard that plants, even in old times at Kew, were once numbered to prevent "theft" of the names. An old Kew hand used to tell me of a time when it was

regarded as stealing to take the name of a plant. What foundation was there for this in fact? R. Irwin Lynch.

CELOSIA PYRAMIDALIS.—I have a bed of these graceful plants in these gardens which everyone who sees them greatly admires. I had my doubts about their suitability for bedding, and kept a number of *Begonias* in reserve in case they should turn out a failure, but they have done so well that I shall not fear failure again. The weather was not the most favourable when they were planted out. They are in the centre of the lawn and fully exposed to the sun. I sowed a packet of Veitch's mixed seed in a pan of sandy soil on January 21st, the colours being from the brightest red to golden yellow. The pan I plunged into a hotbed, pricked off the seedlings three weeks later, four into a small 60, and plunged them as before, potting them off singly about the middle of the month of March, still keeping them in the same hotbed. Their final shift into 48-pots was afforded them in the third week in the next month, when I then placed them on a shelf in a warm greenhouse, and gradually hardened them off, planting the bed in the first week in June. They are now by far the most conspicuous bed in the garden. I have also some very fine specimens of the same in pots, which look beautiful in the conservatory. I kept the plants well syringed all the time that they were under glass, which I think is one of their chief requirements. W. Perry, Higham House Gardens, Colchester.

GRAPES SCALDING AND CRACKING.—Mr. Sheppard's remarks on the above subject contain much that is true, but, as in all other things, circumstances alter cases. I have this year proved fully that the sun does scald the berries even when all other conditions such as heat and ventilation are attended to both night and day, and the internal warmth kept as near to the desired point as possible. For several years we have been much troubled with scalded berries on a Madresfield Court Vine which is in a late vinery, and this in spite of all precautions. The vinery is a high lean - to facing south, the end of which is due east and exposed to that quarter thoroughly, except by the garden wall close by, but which is not a high one. During the month of June the sun shines with great force on that end of the vinery early in the morning, and gradually overtops the garden wall, and at certain times strikes right through the vinery from the end; the bunches of Madresfield Court receive the full glare from the point referred to, and we have had whole bunches on the side facing the end of the house spoilt by scalding. At the opposite end of the same house, which is 30 feet long, is a Vine of Lady Downes, which in some seasons has had its berries badly scalded. This year it occurred to me to shade the east end of the vinery during the critical period with lime, which was thickly laid on the glass a few squares deep, sufficiently so to prevent the sun shining direct on to the berries of either Vine, with the result that not a berry of Madresfield Court is scalded, and only about one-third of those of Lady Downes' Seedling. This, I conclude, is a case where the direct sun's rays do scald the berries irrespective of atmospheric conditions, which I have no doubt have been the proper ones. I am well aware that Madresfield Court is a very thin-skinned Grape, and it is subject to the evils of being readily scalded, and of splitting. The next Vine to the Madresfield Court red is a Black Hamburg, upon which I have never observed any signs of scalding. The best means to adopt to prevent the berries of Madresfield Court splitting is only to pay strict attention to the roots and maintain a buoyant atmosphere in the vinery by means of artificial heat in the case of dull weather and to allow a free, but not crowded extension of laterals on the first signs of colouring. Since adopting this system I have not been troubled with the berries splitting at all. S.

CHRYSANTHEMUMS SHOWING FOR BLOOM.—Plants which are grown for large blooms sometimes form flower-buds during the month of July, which are known amongst growers as July buds, and are considered to be freaks, and in nearly all cases they are useless. One variety only do I know which will develop perfect blooms from July buds—this is Mrs. Alpheus Hardy; therefore if "Young Gardener" has plants of this variety which have already set buds, I would advise him to retain them, even if there is but one to each plant—and there is not much likelihood of more showing at the present time, if the plants are being grown on the

non-stopping method. The variety in question requires such a long time to develop its blooms from the bud stage, that the middle of July has not been found any too soon to "take" buds of it. Although the buds which form at the points of the shoots on any variety during the month of July cannot be called other than crown buds, they are not what is termed the regular "crowns" which cultivators are anxious to procure, but are the result of a freak caused probably by some check in the regular growth of the plants, and too early maturation of the lower part of the plant, perhaps by its remaining too long in a low temperature. It is difficult to account for such freaks of growth, even in *Chrysanthemums*, but "Young Gardener" need not be alarmed; if he will promptly remove the buds, thin the number of shoots on each stem down to the orthodox one, he will find, if the plants receive correct treatment in other respects, that he will have "crown" buds show at a very good time, *i.e.*, from the middle to the end of August. The great point is to remove instantly all superfluous growth from the side branches and main stem directly it is seen that such is not required. Where many growers make a mistake, is in allowing these extra growths to extend 4 inches or so before plucking them off, and such treatment cannot be beneficial to the plants. E. Molynceux.

CAMPANULA PUMILA ALBA is a very old plant, and a very charming one. I have met with it in so many gardens lately, where borders of it are so white and pleasing, with clear white small bell-shaped flowers, and very dwarf habit. Then it gives no trouble, as it is an herbaceous plant, and once planted goes on spreading and lives for years. In the Warwickshire district it is repeatedly met with. *Campanula*.

EARLY TOMATOS.—Mr. Cook's remarks on early Tomatos in your last issue contain valuable hints on the selection of varieties for early work. For earliest crops out-of-doors, and indeed throughout the summer, I have not yet found any excel, and few to equal, the Old Large Red. There are more than one form of it in commerce, some being much earlier than others. I grow the form sold by Messrs. Sutton & Sons, Reading, which I find to be the earliest to ripen of all the varieties as yet tested here. This year I raised about 200 plants in March, grew them in heat until May, when they were transferred to a cool-house, and finally planted in the open on June 3. On June 10, 5 lb. of ripe fruit was gathered from the Old Red, while our first dish from Orange-field, and a variety which greatly resembles it, Earliest of All, was not obtained until June 27. We have gathered good fruit from the preceding varieties since the above dates, at intervals of about three or four days. The Old Red is superior to Orange-field and its varieties in size and flavour, and crops equally well, if not better. Of the smooth-fruited varieties, Horsford's Prelude was the first to ripen fruit under glass. I have not tried it as yet in the open. Ham Green Favourite is considered the best flavoured of all the Tomatos grown here, and several dishes have been included in the dessert. Among the large-fruited Perfection type, Sutton's Perfection was the first to ripen, a good dish being obtained in the open on July 4. Mr. Cook includes Dedham Favourite in his list of varieties for small establishments. I do not believe that there is a better all-round variety in commerce than Dedham Favourite, it being a certain cropper of good weight and quality, in colour a deep carmelian red. Plants for fruiting out-of-doors in June and early in July should be established in 8 or 10-inch pots not later than the last week in April. Throughout May they should be liberally treated, for if at all starved the fruit will refuse to swell, quick swelling of the fruit being of the utmost importance if early dishes of ripe fruit are required. A week is quite long enough for the early plants to batten off in a cool house, planting out as early in June as possible, and protecting if necessary rather than delay planting. If a few pit-lights can be spared, they will be found a help to weakly plants on walls if placed endways. Plants thus protected will require frequent watering until established in their new quarters. For the main crop out-of-doors, 6-inch pots can be made to answer, if the pots are plunged in short dung or other rich medium, and allowed to root through. Plants raised in March, and thus treated, have with us set two, and in a few cases three, clusters of fruit. The fruit does not swell much, but as soon as they are planted out in June it swells to its normal size, ripening from the middle of July onward. Plants

carrying heavy crops require plenty of food. The only manure I use is two parts superphosphate of lime, and one part sulphate of ammonia, well mixed, and applied frequently in quantities, large or small, according to the requirements of each individual plant. *W. R. Williams, Great Marlow.*

PLANTS AT OAKWOOD AND THE LATE WINTER.—On my return from Scotland, I looked round my garden at Oakwood to see what plants killed or injured by the winter and spring could be removed or cut in, and I send a note on some of them, as perhaps some other owners of gardens may like to compare their experience with mine. From what I have seen and heard of gardens in usually not good climates, I believe they have suffered less than those in warmer situations; on the other hand, the same description of plants have, in our garden, been killed in some parts, hard hit in others, and wholly untouched in other parts, showing the effect of different situations. Among shrubs, *Cistus* have suffered most; happily we had struck cuttings of most of the species, so can make a fresh start. Among the species killed are *Cistus monspeliensis*, *C. hirsutus*, *C. Corboriensis*, *C. tauricus*, *C. lusitanicus*, *C. florentinus*, *C. algarvensis*, *C. Cypricus*, *C. creticus*, *C. ocyroides*, *C. cymosus*, *C. villosus*, *C. salvifolius*, *C. oculus*, *C. crispus*, *C. albicaos*, *C. ladaniferus*. *Cistus formosus* is killed in some situations, hard hit in others; uninjured in a recess on our "mountain" side. The only *Cistus* which has proved perfectly hardy is *C. laurifolius*, and as this has beautiful flowers, and makes a fine shrub, I think it would be well that it should take the place of *C. ladaniferus* and *C. Cypricus* where only few species are grown. *Veronica* have also suffered much. *V. parviflorus* has been killed with us everywhere; we grew it by scores, and had a low hedge of it. It bloomed quite into the winter, and was always considered quite hardy. It has sown itself about very freely, so leaves plenty of young plants behind it. *V. salicifolia* is dead; *V. Haastii* hard hit in most places. *V. Traversii*, of which we have many plants, some very large ones, is a complete puzzle to all to whom I have shown it. It has been suggested that difference of constitution of individual plants might account for some being killed, and some untouched. No doubt, to a certain limited extent, seedling plants do differ in hardiness, but in the present case the difference is much too decided to be thus accounted for. We have a hedge of this *Veronica* in fine flower; it had hardly any twigs hurt; it stands on a hill, in a fully exposed situation. *V. epacridea*, hard hit in most situations, was untouched in a few favoured ones. *Eurybia Gunnii* is killed; *Olearia Haastii* touched, but recovering. Of *Azara microphylla*, large plants have the top branches and tips killed; a large number of small plants are most of them killed, some are shooting up from the bottom, and a few in sheltered cool situations are untouched. *Garrya elliptica* is hit very hard, *Raphiolepis ovata* killed. Among rather unexpected survivors are the different *Agapanthus*; *A. umbellatus albiflorus* has a spike, *A. Mooreanus* many spikes of flower, *A. umbellatus* growing well; these are all in beds, without protection. Seedling *Sikkim Rhododendrons* were unhurt in several sheltered situations. *Bulbs* have not suffered. *Iris Kämpferi* have bloomed especially well; *Lilium Kramerii*, *L. giganteum*, *L. Brownii*, and *L. pardalinum* varieties are fine, and *L. auratum*, just coming out, promises to be finer than ever. Taking the garden as a whole, we have lost much less than I expected. I may add that the Lilies here planted in casks, with the bottoms out, some of them now in their third year, show conclusively the advantage of keeping them free from the roots of shrubs and trees. *George P. Wilson.*

FRUIT SOCIETIES.—I strongly approve of your remarks on the action of the Fruiterers' Company. We want now more work and less talk, and I hope the Fruiterers' Company will make the best use of the information already at their hands. We have too many societies dabbling in fruit-growing with very little result. The older societies, like the Horticultural and the Caledonian, have laid an excellent foundation, and the newer societies cannot do better than lend their aid to the older ones. *Fruitus.*

CATLEYA CITRINA GROWTH.—I have a piece of *Cattleya citrina* on a block of Teak consisting of thirteen pseudo-bulbs, and hanging vertically, its leaves downwards, and its last growth, which has

just bloomed, lowest of all. What seems to me unusual is that it is now putting on a new growth next to the top or upper pseudo-bulb but one; does anyone know of a similar instance? *T. B. C.*

THE WEATHER IN THE LOTHIANS.—During the past fortnight it has rained almost daily, and the Strawberries, which in the early districts are at their best, have suffered in consequence. Plenty of warmth accompanied the rain, and everything in field and garden looks well. *W. Sutherland.*

THE HARDINESS OF JAPANESE BAMBOOS.—In the *Gardeners' Chronicle* of July 18, Mr. Gerard speaks of the hardiness of many of these plants. There are two or three plants of *Bambusa aurea* planted out around the large circular basin of water in the kitchen garden at Umberslade Hall, near Birmingham, which have stood the winter uninjured and without protection, and the position is a very low one, almost on a level with a large lake of water just outside the kitchen garden. *D.*

THE ROYAL HORTICULTURAL SOCIETY AND FRUIT CULTURE.—I have been amused to read the report furnished in your columns of the speeches of the mover and seconder of the resolution relating to the Royal Horticultural Society and Fruit Culture, passed at the recent meeting of the Fruit and Veg-table Committee. Had I been present, I should have been tempted to say something concerning that proposition and its promoters. I have a vivid recollection of a meeting of the British Fruit Growers' Association, held at the Crystal Palace nearly two years since, over which Mr. Rivers presided, and when Mr. Wright proposed a vote of thanks to the Fruiterers' Company for what that body had then done on behalf of hardy fruit culture. I ventured, then, to object to that resolution, not only on the ground that the Fruiterers' Company had so far done nothing worth mentioning, especially remembering how long that Company had in the past contented itself with doing nothing at all but giving the Lord Mayor annually a costly present of fruit, and then partaking of a costly banquet with that potentate; but also that the Royal Horticultural Society, which the resolution in question literally ignored, had done so much through its conferences, its committees, and meetings, its publications, and its Chiswick gardens, to promote fruit culture, as well as to spread abroad really useful practical and tangible information on the subject, instead of tall stupid talk which was so often misleading. I got into hot water over that matter, and because I took so prominent a position in protesting against a course which was mere flattery of an effete Company, and which no one else but the *soi-disant* British Fruit Growers' Association thought of offering. Conceive of my interest now that I learn the gentlemen whose action I two years since criticised had really taken my line in relation to the Royal Horticultural Society, and recognised that some credit was due to it for what it had done in the past, and could do in the future. I am not at all surprised that even the greatest adulators of the Fruiterers' Company should have had enough of that body after the truly absurd meeting which that Company recently held at the Mansion House. Generally, its nature was well summed up in the utterance of one of our best known market growers of fruit on the Fruit Committee: "Does the Company think that we are all fools, that after so many years of hard experience in fruit culture, we should need teaching by a Mansion House meeting?" It is all very well to circulate information respecting hardy fruit culture, but when it is urged that cottagers, allotment holders, and small farmers, as well as amateurs, should be instructed in fruit planting and culture, there must be established on their behalf such a system of land tenure as shall encourage them to plant not vegetables only, which are of but a few months' duration, but fruit trees and bushes, which endure for a life-time. Who will plant trees or bushes on a few months' notice to quit? And all the best information in the world will be wasted until that point is settled. All this the huge imposture of the Mansion House meeting ignored. If the Royal Horticultural Society is induced to act upon the resolution carried at the meeting of the committee which I have referred to, it will also have, of course, to face the sterner and most important question of the tenure in land granted to those who may wish, as occupiers, to plant fruit trees, and have no tangible hold on the soil. It is one thing to urge planting fruit trees

that some may sell. It is quite another to see that those who plant may be enabled to reap the reward of their outlay. *A. D.*

FOREIGN CORRESPONDENCE.

ORCHIDS AT THE BRUGES EXHIBITION.

Among the 600 Orchids lately shown by the firm of G. Vincke Dujardin, which won so many honours, a few, at least, of the more remarkable must be mentioned:—1. A hybrid *Odontoglossum*, sepals and petals pure white, much spotted with chestnut-brown; claws of the petals madder-red, the pure white lip marked down the centre with a wide stripe (at least 1 cent. by 1½ cent.), and bearing a very tiny patch of the same colour on either side. Flower-stem bearing sixty-five flowers, recalling in size and form those of *Odontoglossum Andersoni*, but in colouring quite distinct. 2. A hybrid *Odontoglossum*, sepals and petals pure white, marked with many large spots of rich reddish-brown, about three-quarters of an inch in size. In the centre of the lip is a large round mark of the same colour; lip citron-yellow, striped with deep carmine, the form recalling that of *Odontoglossum Alexandræ*. 3. A hybrid *Odontoglossum*, the flower of which resembled *Luckerianum*, but which was quite different in colour; the sepals and petals are rose, plentifully sprinkled with carmine spots; the lip is pure white, slightly spotted with carmine. The stem bore a dozen fine flowers. 4. *O. crispum* var. *Pacho*, very large flowers, nearly 4 inches in diameter, sepals and petals much rounded, snow-white. 5. *O. crispum*, sepals and petals pure white, spotted with pale madder. 6. An *Odontoglossum* of the Andersoni section, sepals and petals notched, pure white, with differently-sized blood-red spots. 7. *O. Princess Clementine*, very graceful flowers, white, thickly covered with small pink spots of pale carmine. 8. *O. crispum*, sepals and petals very fine, violet fading into white, the claw bordered with white, speckled with chestnut brown, flower stem bearing sixteen very large blooms. 9. *Cattleya Mossia Reine des Belges*, six very fine flowers, rich violet, lip well fringed, the centre violet fading into golden yellow, and finally into white, with a border of pale violet streaked with crimson. 10. *C. Mossia*, flowers large, white, flushed slightly with pink, lip in centre violet, veined with white, fading into golden yellow, and finally into pure white. 11. *C. Mendeli*, a splendid specimen, sepals, petals, and lip pure white, saffron yellow in centre, passing into pale mauve, veined with white. 12. *Vanda tricolor Vinckii*, sepals snow-white, petals white, covered with small spots of reddish brown, lip reddish violet, a very handsome variety. *Ch. De Bosschère, Liège.*

BRUGES.

The Queen of the Belgians and Princess Clementine paid on Saturday, July 18, a visit to the horticultural establishment of M. G. Vincke-Dujardin, at Scheepscade, near Bruges. The royal visitors were taken through the eighty-two glass-houses, and expressed pleasure at the sight. The fine collections of Orchids especially attracted notice from the Queen and Princess. Much admired also were the fine Palms, which are another specialty of this firm. This visit, and that recently paid to the Bruges Exhibition, furnish additional proof of the interest taken in horticulture by the Belgian Royal family.

EXHIBITION AT LEDEBERG, NEAR GHENT.

This will be held in a building specially constructed for the purpose, which will quite cover the Place de Congrès. It will measure 120 feet in length by 156 feet in breadth, and will have direct communication with the galleries of the Town Hall, in which will also be placed many plants. The new building will be elegant, well lighted and ventilated, so that the whole effect will be imposing.

ANTWERP.

The formal opening of the International Exhibition of vegetable products, horticultural and micro-

scopical exhibits, will take place in the presence of various civic and military authorities, on August 9, at 11 o'clock. The permanent horticultural exhibition will be very fine, thanks to the assistance given by the largest horticultural firms in the country.

THE SEED TRADE.

CABBAGES BOLTING.—The subject of the "bolting" or premature running to seed of Cabbages is one which has engaged considerable attention of late, because of its being a matter of importance to all gardeners, and especially so to those who grow for market. It has long been held by gardeners that there is an intimate connection between the time of sowing and the bolting of Cabbages, and in order to practically test this matter, Messrs. Hurst & Sons last year made at their trial grounds at Chelmsford, a series of experiments, which took the form of successive sowings extending over a period of six weeks.

Four leading varieties of Cabbages were selected for the purpose, viz., the Improved Nonpareil, Early Rainham, Myatt's Offenham, an early dwarf Cabbage of excellent quality, having peculiar white veins on the leaves, a remarkably good variety introduced by Mr. Myatt, of Eversham; and the Early Higham, one of the Enfield Market type—all leading market garden varieties which are largely cultivated round London. The first sowing was on July 7, the second on the 14th, the third on the 21st, the fourth on the 28th, the fifth on August 4, and the sixth on August 11. A piece of ground in an open field was prepared, and twenty plants of each variety planted out on the same date, in lines containing that number, the produce of each sowing being kept by itself, that is to say, four rows of the sowing of July 7 side by side, and so on. When the plants were examined at the end of May, it was seen that out of the 20 plants of the Nonpareil 11 had bolted to seed; of the Rainham, 5 had bolted; of the Offenham, none; and of the Early Higham, 2 only. The sowing made on July 14 showed the following results: of the Nonpareil, 13 had bolted; Rainham, 4; Offenham, 1; Higham, 1. July 21: Nonpareil, 12 had bolted; Rainham, 5; Offenham, 3; and of the Higham, 5. Of the sowing made on July 28, Nonpareil, 2; Rainham, none; Offenham, none; Higham, none had bolted. Of the sowing made on August 4, Nonpareil, 2 only; and of the other three, none. Of the last sowing, made on August 11, not a single plant of any of the sowings had run to seed.

If any inference can be drawn from these trials, it appears to be this: that early varieties of Cabbage for spring use should not be sown until the second week in August, and the later varieties from the first to the second week. Mr. Circuit, of Rainham, who grows the Rainham Cabbage very largely for market, commences to sow about July 25, and continues to make successive sowings of this variety up to the middle of August. One of the finest types of an early Cabbage I have seen of late is Sutton's Earliest, a variety with very few outer leaves that hearts in very quickly; and they recommend that the autumn sowings of this Cabbage should not be made until the early days of September.

That sowings made during the first two weeks in July do not produce a corresponding advance in the time of turning in was seen from the fact that between these and the last two sowings in the corresponding weeks in August there was the difference of a fortnight only in turning in.

A word of commendation is due to the Offenham Cabbage. This has evidently been carefully selected, and the stock as seen at Chelmsford is very true and fine. It is an early variety, very hardy, that stood the severe winter remarkably well; it produces but little in the way of outside leaves, and it stands well before running to seed. And referring to the records given above, it does appear that whether the Offenham be sown early or late it stands without bolting to seed better than any other of the varieties sown with it. *Pisum*,

NURSERY NOTES.

GLOXINIAS AT MESSRS. J. PEED & SONS' ROUPELL PARK NURSERIES.

The annual display of these beautiful flowers at the above establishment maintains its previous high standard, the plants exhibiting a remarkable robustness of growth and freedom of flowering. Amongst this year's novelties noteworthy of mention are:—French Grey, a delicately spotted variety; and Loveliest among the Lovely, a superb flower. Seedlings in all stages of growth meet the view, some 10,000 of these utilising every inch of spare space on the long tiers of shelving running the whole length of the houses in which the yearly display is made. Good flowers amongst the older varieties were noted in A. Luff, John Peed, The Chinaman, Loveliness, and Her Majesty.

The Gloxinia has been well stated to be a bad "traveller." Exhibitors and growers generally have often found this out to their cost. To obviate this difficulty, Mr. Thomas Peed has hit upon a most useful invention for supporting the blooms, this consisting of a wire support and india-rubber ring placed round the stem of the flower, serving the double purpose of keeping it firm, and showing it to the best advantage. X.

ORCHIDS AT McARTHUR'S NURSERY.

At the London Nursery, Maida Vale, Orchids form the greater part of the stock, and care is taken to provide neat and well-grown plants of all the rare things at as cheap a rate as possible. Among the batches of uncommon things which are specially noteworthy are *Cattleya Warocqueana*, of which there is a good stock of unflowered plants, as well as many of the fine named varieties of this beautiful autumn-flowering labiate. *Lælia autumnalis alba*, too, is well represented by several specimens; the plants of *Vanda Kimballiana* and *V. Amesiana*, and a fine lot of *Dendrobium Dearei*, are noticeable for their vigorous growth. A number of *Miltonias* are in a flourishing condition, the foliage not exhibiting the yellow hue usually seen on these plants when under cultivation. The large demand for cut flowers for the heavy business in furnishing for balls and general decorations which this firm undertakes, being unusually pressing this season, the Orchid-houses have been invaded, and many of the showier Orchids have been cut; but still many good things are in bloom, and among them we noted some superb forms of *Odontoglossum Harryanum*, a fine specimen of *O. Uro-Skinnerii*, in bud; and several *O. crispum*, *O. Pescatorei*, and various *Masdevallias*. Also in bloom are some good forms of *Miltonia vexillaria*, a specimen of *Aërides odoratum*, some good *Cypripedium Curtisii*, *C. superbiens*, and other *Cypripediums*; some *Cattleyas*, a plant of *Phajus Humblotii* in bud, which promises to be the white form; the curious little *Dendrobium macrostachyum*, and the large and showy *D. McCarthiae*, both of which are imported together, and are much alike in growth; *Saccolabium guttatum*, several of the pretty white and fragrant *Angraecum falcatum*, and several specimens of the handsome *Utricularia montana*, which is generally associated with the Orchids.

Lilies and other bulbous plants are also a specialty at this neat and well-tended nursery, and the show-house is very effectively arranged with plants of them in flower.

STRAWBERRIES AND VEGETABLES AT BURGHLEY HOUSE.

That fine specimen of a gardener, Mr. R. Gilbert, of Burghley House, Stamford, has always surprises in store for every visitor to the gardens. And this year the greatest surprise to us was a dish of British Queen Strawberries, every fruit of which would measure 8 inches in circumference, and ripened to the very tip. The old man was undis-

guisedly proud of them, and to convince us that he had not searched the bed over for them, we were taken to see it; and to our surprise, many such dishes could have been gathered that morning, and many more at a later date.

There must be something in the soil and the air on Burghley Hill which favours early maturity, and perfect development; in corroboration of which, several things were observed during our short stay. The soil is deep, warm, dry, and overlies a stratum of red sandstone, which will answer for a good deal in garden crops, be they Peaches, Strawberries, Onions, or Cabbages.

Another fine-looking Strawberry was Gilbert's seedling Chief Secretary, which is good in colour, fair in flavour, and firm of flesh, bearing carriage uncommonly well, and the plant a vigorous grower. It has the making of a good market fruit, and everything being marketed at Burghley, its merits in that way were put to a good test this season. A number of Strawberries are grown, and all well, but they consist mostly of the standard varieties. The rows of plants are set wide apart, generally some 3 feet, and none was more than three years old. The best fruits are borne the first and second years, but they are later in coming to maturity the second year, and still later the third year than the second. The Strawberry quarters, when the plantations have reached full age, are skimmed over, the plants carried away, or burnt on the ground, which is planted with Kales, Broccoli, and the like, Gilbert's beloved crowbar being brought into use to make the holes for them.

Some very fine things in Peas were noted. Charles I., raised by Mr. Myatt, of Ovington, is a good productive Pea for early sowing. It has the flavour of Ne Plus Ultra, but is a better cropper by far, and does not grow so tall as that variety. It was shown at the Vegetable Conference at Chiswick, and was then stated by the judges to be Standard, which is a variety of Mr. T. Laxton's raising, and something very different. Very fine White Elephant Onions (transplanted) at about 1 foot apart were noticed. It is an admirable early winter variety that looks like an enlarged edition of the Queen. The earliness of Burghley Gardens was well shown (July 12) by some ripening Tomatos—the old red or one much like it—on a warm border, in the open, and tied to sticks.

Wall fruits are generally abundant. Morello Cherries especially so, although some of the trees are full of yellow fruits, which will fall—the effect of the late frost in May.

Much of the fruit on the fine old Vines and Peaches in the early houses was already marketed, but enough remained on those in the late houses to show that good crops and fine fruits only are tolerated. *A Roamer*.

ROSES.

ROSE LA FRANCE OF 1889.

This fine hybrid Tea was raised by M. R. Moreau, Angers, from seeds of Reine Marie Henriette, sown in 1883, which in the previous year had been fertilised with pollen of La France. Only two of these seeds germinated, one a very weakly growing plant; the other with a strong bushy habit, which in two years had formed a bush 1 metre high by $\frac{1}{2}$ metre in diameter, with three strong shoots $1\frac{1}{2}$ metre long. In the spring of 1886 these shoots, which hitherto had carried no flowers, were cut back to 1 metre in height, and all the other wood was removed. In the course of that year, a bloom of extraordinary size, and of a bright cherry-red colour, appeared. This novelty appears to possess much affinity with Guillot's La France, in habit of growth, freedom to bloom, and in foliage. Hence the above name.

Later observations show that it possesses a vigorous habit with very strong shoots, having a few slightly-bent thorns. The bloom is spherical,

and large; the very strong bud short, egg-shaped, in colour red, edged with carmine. It has a pleasant fragrance. It is a Rose that will be very generally cultivated, *Extract from Moller's Deutsche Gartner Zeitung.*

EPIDENDRUM VITELLINUM.

MR. SWAN, of the Gardens, Castle Hill, Englefield Green—one of our old correspondents, especially upon matters relating to Orchids—sends us flowers of *Epidendrum vitellinum*, nearly regular in form, and semi-double. One of these flowers is shown in Fig. 18. No two flowers were quite alike, but broadly speaking there were three regular sepals, three regular petals (regular peloria), three petaloid stamens, and within them an indefinite mass of filaments, some of which represented, no doubt, the second row of stamens and the three carpels.

A section across the pedicel showed six equal vascular bundles in a ring, besides a vast number of smaller ones irregularly distributed, and doubtless arising from the forking and subdivision of the six primary ones. The same plant produced similar flowers last year.

VARIORUM.

WINE FROM BLACK CURRANTS.—The wine which is properly made from the black Currant may be said to be the best of those made from small fruits, and is equal to the best French red-wine, and similar in tint. It also possesses a particularly fine flavour, and is perfectly free from deleterious ingredients, and is therefore of much benefit when partaken by the sick and convalescent, as it never causes headache. No wonder that the fabrication of this wine has greatly increased in recent years. Those who possess bushes of this variety of Currant should not neglect to make a cask of the wine every year, which when the labour and the fruit cost nothing, comes to about 12 to 18 kreuzern=*3d.* to 4½*d.* English, per bottle of 1½ pint.

The fruit must be picked in dry weather, and cleared from the stalks, put into broad pans or dishes, and squeezed with the hands, and subsequently shaken about in a hair sieve till the juice has run off. The latter must be put into a clean cask to ferment, with water in the proportion of 1 litre juice to 2 litres water, and to every litre of the mixture 1 to 2 lb. loaf sugar—the greater the proportion of sugar the stronger the wine. The quantity of sugar is, for ordinary wine, 425 to 500 grammes sugar; for dessert wine, 600 to 700 grammes; and liqueur wine, 1000 grammes=1 kilog. Rum and brandy casks may in case of need be used for holding the wine, but these should be first washed out with a hot strong soda-ley, and afterwards with clear water. If the cask is without smell, and quite clean, the whole may be put into it, and it should be placed in a cellar where there is a temperature of 62° to 66°, covering the bung-hole with an inverted wine-glass, and the fermentation awaited, which will be set up in a day or two. When the ferment is fully commenced, a yeast-pipe should be fitted tightly into the bung-hole, otherwise the wine will readily set up an acid (vinegar) ferment. When the hissing and bubbling noises are no longer heard when the ear is placed to the bung-hole (October or November), fill the cask with wine, or failing that, with sugar-water, and so that it remains always full to the bung-hole; it must frequently be examined.

In March the wine will be quite clear, the yeast has sunk to the bottom, and then is the time to run it off into another clean cask, which must also be kept quite full. If another cask be not to hand, the wine may be run out into clean vessels, the fermenting cask made clean, and the wine returned to it. The dregs should be allowed to run through a thick flannel cloth, and the clear liquor put with the rest of the wine. In a few months, in a cool cellar, the wine will be fit to drink, and may be drawn off into

bottles, and well corked and sealed; and these may be stored horizontally or upright.

If the cask is not wanted for some time, it should be washed out with hot soda water several times, and when dry, a little sulphur-paper, or rag, burnt inside of it, suspending the former with a piece of wire, and letting it burn with an almost closed bung-hole. This process of sulphuring must be often repeated, if the cask remains a long time unused. *Mittheilungen der K. K. Gartenbau Gesellschaft in Steirmark*, for July, 1891. A yeast pipe, it may be explained, is a large tin pipe, made with an obtuse angle about the middle, and is used for conducting the yeast into a tub that is stood alongside the wine cask. *Ed.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 21.—Present: Dr. M. T. Masters, in the chair; Mr. Morris, Mr. Blandford, Rev. W. Wilks, Rev. G. Henslow, Hon. Sec.

Comifers attacked by Chermes.—With reference to this subject, brought before the committee at the last meeting, Mr. Blandford remarked on the difficulty of destroying the insects with the paraffin spray, inasmuch as it was practically useless for large trees, and could be only applied to small ones; moreover, it will not remove them unless it be applied with force, and in that case water alone would answer the purpose. The only effectual method was

FIG. 18.—EPIDENDRUM VITELLINUM: REGULAR PELORIA, ETC.

to nip off the galls made by the chermes. From some observations of Dr. Masters, it would seem that the gall-making species does not appear to attack the Larch, but only the Spruce Fir, though other species of chermes attack various members of the Conifera.

Microscopical Structure of Hybrids.—Dr. McFarlane sent photographs illustrating the microscopical structures of *Lapageris*, *Philesia*, and of the hybrid between them, *Philageria*. In all cases the anatomical details of the hybrid were intermediate in character between those of the two parents.

Primula sikkimensis attacked by Slugs.—Rev. C. Wolley Dod sent plants from which the cortical chlorophyllaceous tissue had been gnawed off by the common white slug. As a proof of their partiality, he observed that stalks of *P. rosen* and of *Dodecatheon*, growing side by side with the above, were not touched. If the *P. sikkimensis* is barked soon after flowering it withers and develops no good seed.

Loranthus (?) from Bechuanaaland.—Mr. Johnstone forwarded a specimen of what appeared to be a species of *Loranthus*, on which he observes: "It had a small berry, not quite round, of a colour similar to red coral, on a short stalk." It was referred to Kew for identification.

Apple and Pear Twigs Barked.—Mr. G. Lee of Clevedon sent some more specimens, but no new light could be thrown upon the injury. A method adopted by Mr. Bunyard, who is familiar with the fact, may be mentioned. In cases where nocturnal beetles or other insects attack young trees, he lays a sheet under the tree, and by violently shaking it, the insects fall upon it, are easily seen, and then dispatched.

Strawberries attacked by Beetles (?).—Messrs. Wood & Ingram, of Huntingdon, forwarded specimens of beetles of two species, *Harpalus ruficornis* and *Terostichus madidus*, supposed to have been the depredators. They are nocturnal, but very exceptionally vegetable feeders, hence some suspicion was felt as to their being the right insects; and the question was raised as to whether they had been actually observed eating the seeds of the Strawberries as described. If the above beetles were the real enemies, hand-picking at night is the only method of destroying them, as they are nocturnal in their habits.

Plants, &c., Exhibited.—Dr. Masters showed a specimen of *Weigela sessilifolia*, with small scentless and yellowish flowers, a dimerous *Cyrtipedium*, a pelorian *Linaria vulgaris*, and a prolific Carnation. Mr. Henslow exhibited a white Iris with two flowers, both being dimerous instead of trimerous. Members of the Scientific Committee may be reminded that the next meeting on August 15th will be the last of the session. The first meeting of the winter session will be held at Chiswick on October 6th on the occasion of the Conifer Congress.

NATIONAL PINK SOCIETY.

NORTHERN SECTION.

THE annual exhibition was held in the Botanical Gardens, Manchester, on July 18, and there was a good competition in all the classes.

For twelve blooms, six at least dissimilar varieties.—1st, Mr. A. K. Brown, Handsworth, Birmingham, with very fine blooms of Boiard, Amy (Brown's), Bertram, Maud (Brown's), Ethel, Minerva, Mrs. J. Cronk, and Modesty; 2nd, Mr. S. Barlow, Chaderton, Manchester, with Boiard, John Dorrington, Nothing Better, Hooper's No. 1, Mrs. Barlow, George Hodgkinson, and Defiance, an excellent stand.

Six blooms, dissimilar.—1st, Mr. C. H. Thurstan, with Boiard, John Dorrington, Mrs. Thurstan, and three seedlings; 2nd, Mr. A. K. Brown, with Mrs. Dark, Bertram, Ethel, Amy, Modesty, and George White.

For six blooms, not less than three dissimilar varieties.—1st, Mr. A. K. Brown, with Bertram, Amy, Minerva, The Rector (Fellowe's), and Mr. J. Cronk; 2nd, Mr. W. Taylor.

For three blooms, a purple-laced, a red-laced, and a black-and-white, 1st, Mr. Taylor; 2nd, Mr. Barlow.

Single-bloom of purple-laced.—1st, Mr. A. K. Brown, with Bertha; 2nd and 3rd, Mr. Saml. Barlow, with Boiard; 4th and 5th, Mr. Taylor.

Single-bloom, red-laced.—1st and 3rd, Mr. Brown, with Empress of India, and 2nd with Amy. 4th and 5th, Mr. Taylor, with seedlings.

For collection of Pinks set up in bunches as cut from the borders.—1st, Mr. T. Walkden, Sale, Manchester, with a group in which Souvenir de Sale, William Brownhill, and Mrs. Walkden were the most noticeable.

The Premier blooms were:—red-laced, a fine bloom of Empress of India, by Mr. A. K. Brown; and purple-laced, for a fine bloom of Boiard, both in Mr. Brown's 1st prize stand of twelve.

First-class Certificates were awarded to Mr. A. K. Brown, for seedling Amy, a very first-class flower; and Bertha (Paul), a very fine purple-laced flower. Also to Mr. J. Edwards, for James Percival, red-laced, a fine flower; and to Mr. J. Walkden, for a very fine white self, with broad petals and smooth on the edge.

ACTON HORTICULTURAL.

THE twenty-fourth annual show of this Society, which was held on Wednesday, July 22, proved to be a success. Much interest centred on the event, as it may be remembered that last session an Act was passed which, dealing with open spaces, enacted that they might be closed (at stated times) for horticultural and agricultural purposes. Taking advantage of this Act, the Committee of this Society secured the consent of the local authorities for the holding of this year's show in the Acton Park and Public Recreation grounds.

The exhibition was certainly one of the best the Society has had, and the gardeners of Acton are to be congratulated upon being able to produce, amongst so much bricks and mortar, such satisfactory results.

For a group of stove or greenhouse plants, arranged for effect, Mr. T. Butcher, gr. to J. Toynbee, Esq., East Acton, 1st, with a pretty arrangement.

Mr. G. Reynolds, gr. to Messrs. de Rothschild, Gunnersbury Park, put—not for competition—a

group of a very choice description, which was much admired.

Specimen plants, both foliage and flowering, were not of gigantic size, it is true, but were nevertheless well grown, the foliage stuff being finely coloured. The principal prize-winners were Messrs. J. Fraser, C. Burrows, S. Beech, T. Butcher, G. Benham, C. B. Green, and W. Polley.

Fuchsias were a feature to be remarked. The special prizes (Mrs. Walker's) were the means of bringing forward eight entries, or 48 plants, a beautiful and effective feature. In this class the successful competitors were Messrs. J. Fraser and G. Benham.

Rose blooms were shown in very fine condition (not for competition) by Messrs. C. Lee & Co., Ealing. Very highly commended, was Mr. G. Weedon, St. John's Nursery, Ealing, for tastefully arranged floral decorations.

Fruits and vegetables were shown well by the gardeners; and Mr. S. Beech, gr. to C. Essex, Esq., Oldfields, gained the special prizes offered by Messrs. Sutton & Sons and James Carter & Co. for collections of vegetables. The cottagers' exhibits were good throughout.

The management of the show was admirably carried out by Mr. C. B. Green, the Society's Hon. Secretary.

THE DITTON HORTICULTURAL.

The fourth annual exhibition of this Society took place on Wednesday, 22nd ult., at The Cedars, Thames Ditton, by kind permission of H. Cooper, Esq.

It is gratifying to record that it was a distinct advance upon previous shows, particularly amongst the groups of plants arranged for effect, which formed a pretty and attractive feature. The prize-winners in this section were:—Mr. J. Plowman, gr. to L. Smith, Esq., Woodstock, Long Ditton; Mr. W. Palmer, gr. to the Right Hon. W. F. Hume Dick, Thames Ditton House; and Mr. H. Farr, gr. to Hannibal Speer, Esq., Manor House, Thames Ditton.

Stove and greenhouse plants were shown in fine condition by Messrs. Farr & Palmer, the latter exhibitor taking Messrs. Sutton's special prize for a collection of vegetables, with some extra fine samples. Non-competition groups formed an attractive feature. Here Messrs. Barr & Son, King Street, Covent Garden, whose nursery-grounds are in the neighbourhood, sent a fine collection of hardy flowers.

Messrs. Lewis & Williams, Ember Nurseries, a good display of bouquets and other cut flowers. Mr. R. Lambert, Thames Ditton, some fine Poppies, Roses, and Stocks. Messrs. John Laing & Sons, Forest Hill, a first-rate, well-arranged collection of hardy flowers, and Messrs. Peed & Sons, Streatham, fine Gloxinias.

The cottagers made a good display of flowers, fruit, and vegetables.

The show was a great success, being well attended, and a word of praise should be accorded in this connection to the Hon. Secretary, Mr. W. Palmer, and the Hon. Treasurer, Mr. A. W. Cousins, for their well-directed efforts in arranging so good a show.

LUTON HORTICULTURAL.

JULY 22.—The annual exhibition of this Society took place in connection with the meeting of the Bedfordshire Agricultural Society at Luton, three large tents being set apart for the purpose. It is almost invariably noticed that when this occurs, horticulture takes only the secondary place; the horse-ring, with its jumping attractions, puts the garden and its products completely in the shade.

Luton not being a plant-growing district, there was not a great display of specimens, but Mr. W. Baillie sent from Luton Hoo Gardens three fine groups, and Mr. Hempson, gr. to Lady Wingfield, Amphill House, a large and imposing one, and in each case a high commendation was awarded. The best collection of plants arranged in the form of a decorative group, came from Mr. W. Cook, gr. to B. Bennett, Esq., Cheverells Park; Mr. A. Barford was 2nd, and Mr. H. Brown, Highfield, 3rd. Coleus, Fuchsias, Begonias, foliage and flowering, &c., were fairly well shown, but not of a character to require particular notice.

The great feature of interest consisted of the Rose competition, which was an open one. The best twenty-four came from Mr. C. Turner, Royal Nursery, Slough—a superb lot of H.P.'s, large, full, and brilliantly coloured. The following well deserve special mention:—Pride of Waltham, Sir Garnet Wolseley, Marie Banmann, Her Majesty, grand;

Duke of Edinburgh, Duke of Teck, fiery crimson-scarlet; Charles Lefebvre, L'Eclair, Gloire Lyonnaise, A. K. Williams, Alfred Colomb, and Mrs. J. Laing. Mr. F. Cant, Colchester, was 2nd, with as fine a bloom of Madame Gabrielle Luizette as has been seen this season; also Jean Souper, Dupuy Jamain, and Dr. Andry. Mr. B. R. Cant, Colchester, was 3rd; but the latter took the 1st prizes in twenty-four Tea-scented varieties—a very good lot of flowers; Mr. F. Cant being 2nd. With twelve varieties, Mr. C. Turner was 1st, and Messrs. Laxton Bros., Bedford, 2nd.

The best twelve Roses staged by amateurs came from the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, who had some capital blooms; Mr. G. Cook was 2nd.

Another prime feature of the show was the bunches of hardy herbaceous plants shown by Messrs. Laxton Bros., Bedford, who exhibited very fine bunches of plants not generally shown, such as *Platycodon grandiflora* and its white variety; *Coreopsis lanceolata*, *Catananche cœrulea*, and *C. bicolor*; *Centaurea macrocephala*, *Scabiosa caucasica*, finely coloured; *Michauxia campanuloides*, *Dianthus Napoleon III.*; a fine form of *Gaillardia hybrida grandiflora*, &c.; Mr. G. Cook was 2nd.

A large and interesting collection of Sweet Peas was also shown by Messrs. Laxton Bros., which attracted a good deal of attention. Other cut flowers were shown, but nothing that was above the average was noticed.

Forced fruits were sparingly shown, but outdoor fruits more largely, and these were generally of good quality.

Vegetables were both numerous and good, the chief interest in them centring round the classes where Messrs. Sutton & Sons, of Reading; Messrs. Daniels Bros., of Norwich; Messrs. James Carter & Co., High Holborn; and others offered special prizes.

Table decorations, bouquets, baskets of flowers, &c., were numerous and good, and, as is generally the case, proved of great interest to lady exhibitors.

WALTHAM ABBEY AND DISTRICT HORTICULTURAL.

JULY 23.—This is one of the best of the suburban horticultural societies, and it is worthy of remark that while most horticultural shows appear to have suffered through the lateness of the season, the one held at Waltham Cross was exceptionally good; the honorary contributions made a good show in themselves. Mr. J. Nicholson, gr. to W. Melles, Esq., Sewardstone, brought a number of orchard-house trees in pots—Peaches, Plums, Apples, &c., all in good fruiting condition. Mr. Melles is going in for fruit culture on a somewhat extensive scale, and it appears quite successfully. Messrs. Paul & Son, Cheshunt, had some capital dwarf-growing *Cannas* in pots, *Disa grandiflora*, a very fine lot of cut flowers of hardy plants and Roses, outdoor fruits, vegetables, &c. Mr. W. Rumsey, nurseryman, Waltham Cross, had a fine lot of cut Roses, which he had backed with Ferns, &c. Mr. Thomas Rochford, Tarnford, had a fine group of Palms, Ferns, Bermuda Lilies, &c. Also Cucumbers, Melons, and very fine Tomatos. Mr. George Poyser, Cheshunt Street, had a fine lot of Trophy Tomato, which appears to be a favourite market sort in this district; Mr. J. B. Riding, florist, Chingford, a remarkably fine strain of erect-flowering Gloxinias; and Mr. J. Riding, gr. to A. J. Edwards, Esq., a large and well-arranged group of plants. All the foregoing were highly commended.

There were two classes for groups of plants arranged for effect, one with Orchids and one without; and some charming features resulted. The best group, including Orchids, came from Mr. Ayling, gr. to A. J. Hollington, Esq., Enfield, who made excellent use of a quantity of fine Cattleyas, interspersed with suitable foliage and other flowering plants. Mr. J. Nicholson, gr. to W. Miller, Esq., was 2nd, with a very good arrangement also; and he was placed 1st in the other class; Mr. J. Turk, gr. to P. Bosanquet, Esq., Little Berkhamstead, was 2nd.

Mr. Nicholson had the best six miscellaneous plants, and Mr. Ayling was 2nd; and they held similar positions in the class for six stove and greenhouse plants, some remarkably good specimens being staged. Mr. Ayling had the best six Ferns; Mr. J. Green, gr. to Sir T. F. Buxton, Bart., was 2nd; but he staged the best specimen Fern, having a fine plant of *Gymnogramma Laucheana*. Mr. E. Ayling had the best Orchid—a well-bloomed piece of *Cattleya Mendeli*.

Caladiums, tuberous-rooted Begonias, and Achimenes were very fine indeed, from Mr. Ayling; Fuchsias, Coleus, &c., were all well shown; the Caladiums from Mr. J. Nicholson were beautifully effective, and the leaf-markings very fine.

Cut flowers were excellent, especially the twelve bunches shown by Mr. Ayling, who had many fine Orchids; Mr. C. May, gr. to H. J. Adams, Esq., Enfield, was 2nd. Roses shown by gardeners and amateurs were good; so were the hardy flowers.

Fruits of the better kinds were sparingly exhibited. Mr. Ayling was successful with white and black Grapes. Outdoor fruits were on the whole very good, but Strawberries a little over-ripe.

Ladies were to the fore with table decorations of various kinds. Miss Vincent, of Waltham Abbey, was 1st with a series of vases, as also for one vase. Vegetables were better than we have yet seen them, but that is to be expected as the season advances.

THE BRITISH FRUIT GROWERS' ASSOCIATION.

Conference in Beddington Park.

At a meeting of this Association held on Thursday last, the following was adopted as the programme for the Conference in Beddington Park on Monday, August 3. Sir James Whitehead, Bart., one of the Vice-Presidents of the Association and Master of the Fruiterers' Company, will take the chair at 4 p.m., and will deliver an opening address, to be followed by Mr. T. Francis Rivers. The next subject is "Object Lessons in Fruit Growing for Cottagers and Allotment Holders," illustrated by diagrams, by Mr. John Wright. Mr. G. Hammond will follow with some hints on "How to Encourage Fruit Culture amongst Small Farmers and Cottagers." Mr. Joseph Cheal will deal with the "Preparation of the Soil for Fruit Trees," Mr. George Gordon will discuss the "Extension of Fruit Culture, and the Work of the British Fruit Growers' Association;" the Rev. T. W. Sharpe proposes to consider the best methods of including fruit culture in the technical education scheme, while several other members have promised to take part in the proceedings, and to contribute hints likely to be of interest.

It was resolved early in the season to render the meeting as useful as possible to the numerous cottagers and allotment holders in the district; the programme has therefore been prepared with a special view to their requirements. The exhibition held by the local Society is expected to be both large and interesting, and if the weather prove favourable, a large attendance is anticipated.

I am also desired to state that important papers and addresses on fruit subjects are promised for the Conferences at Cardiff on August 12th, the Crystal Palace on September 4, and Edinburgh on September 10. *Lewis Castle, Hon. Sec., Hotham House, Merton.*

LAW NOTES.

A NURSERYMAN'S CLAIM FOR WORK DONE.

IN the Westminster County Court on Thursday July 16, the case of *Edge v. The Uxbridge Lawn Tennis Company*, was before his Honour Judge Bayley, and was an action by the plaintiff, Mr. William Edge, who carries on business as a nurseryman at Bedford Park, Chiswick, to recover the sum of £158, balance of account for work and labour done on behalf of the defendant Company.

The plaintiff, Mr. William Edge, was called, and said he was a nurseryman and florist, and carried on business at Bedford Park, Chiswick. In February last he sent in a tender to the defendant in connection with the levelling of a new lawn tennis ground. He agreed to do the work for a certain price, but he had not proceeded very far with it, when he came upon a bed of clay and springs of water. He communicated the fact to one of the directors, and told him that he could not carry out the work for the agreed price. He was then told to continue the work and not to let it stop on any account, and if no arrangement as to price could be arrived at, he (plaintiff) should certainly be paid for what he had done. The work continued until April, up to which time £189 had been paid on account, and witness was asked to

send in a statement of account, which he did, and which showed that there was due to him the amount now claimed. After that a new arrangement was entered into, and it was agreed that the labour and profit account should be paid every week. That arrangement had been continued until the work was finished, but the sum which was due before it came into force, had not been paid.

For the defence, Mr. John George Wiley was called, and said he was a director of the company. He denied that the first arrangement was ever departed from, and contended that the plaintiff had been paid all he was entitled to.

After hearing the whole of the evidence, his Honour said he had no doubt that the contract had been waived, and that extra labour had been entailed in consequence of the clay and water, but he (the judge) was satisfied that the plaintiff had been paid all he was entitled to, therefore judgment would be for defendants with costs.

LOPPING AND TOPPING TREES.

As many farm leases contain a clause to the effect that the tenant may not "cut, lop, top or crop" the trees (except Pollards) on the farm, it may be useful to report the following case, in which the Court of Appeal recently decided that to "lop" a tree is not the same thing as to "top" one. The case (*Uwain v. Hanson**) arose under the 65th section of the Highways Act, 1835 (5 & 6 W. IV. c. 50), under which magistrates have power to order trees which overhang the highway, or damage it by excluding the sun and wind from it, or which obstruct it, to be pruned and lopped so as to prevent such damage or obstruction. The plaintiff was the owner of land adjoining a highway, and he brought his action against the defendant, who was the assistant-surveyor of the parish highways, for injuring his trees by improperly cutting them. The defendant relied for his defence on the above-mentioned section of the Highways Act, 1835, and on a magistrates' order made under it which directed him to "lop and top" the trees in question. The plaintiff contended that "topping" and "lopping" trees were different operations, and that though the Act gave power to the magistrates to order the trees to be "lopped," it gave them no power to order them to be "topped." And so the Court decided.

The Master of the Rolls, in giving judgment, said that when Parliament had to deal with matters relating to the general public, it used words in their ordinary and general sense, but when it dealt with particular businesses or transactions, and used words which had a particular meaning in connection therewith, the words so used must bear such particular meaning. The Highways Act referred to country matters, and had to be administered by country justices, and it spoke of the "lopping" of trees. It would be mere pedantry for the court to pretend not to know that "lopping" was always understood by people, who had anything to do with trees, as meaning the cutting off the lateral branches, and that cutting off the head of the tree was called "topping" it. "Lopping" and "topping" were entirely different, and "lopping" did not include "topping." The defendant, therefore, when he "topped" the plaintiff's trees, exceeded the power given him by the Act, which only authorised him to "lop" them, and he must, therefore, be held liable. *Journal of the Royal Agricultural Society.*

A BEE-SWARMING CASE.

In the Sheriff Court, at Elgin, N.B., on Friday—Sheriff Rampini on the bench—James Dean, Loch-bill, Urquhart, sued John Shand, Urquhart, for 20s., being the price of a swarm of bees which flew away from a hive in the pursuer's garden and entered a hive belonging to the defender. The pursuer stated that on the 29th of June he and his wife were watching a hive of bees which were likely to swarm. The bees went off in the direction of the defender's, and his wife followed them. At night he got two

neighbours to go along with him to claim the bees. They did not, however, see the defender, and his daughter refused to let them see the bees, which, she said, belonged to her father. He never got his bees back. They were well worth 20s. Mrs. Dean said the bees alighted on the hive, and went right into it. Shand and his son admitted that the bees went into their hive, but they stated that there were bees in the hive, and that they were weak. John Shand, the defender, stated that he did not claim the bees, although he admitted that they entered the hive, which belonged to a son who resided in Glasgow. He was quite willing to let the pursuer have the bees, if those previously in the hive were not disturbed. Mr. J. Allan Jeans, who acted for the defender, maintained that the action should have been raised against Charles Shand, a son of the defender's, who resided in Glasgow, and the defender could not be made responsible. Mr. Brown, who defended Shand, contended on the other hand that the bees were on the defender's property, and in his possession, and he was entitled to pay for them. His lordship, in giving judgment, said the story about the son being the owner of the bees, appeared to be an afterthought, and he gave decree for 20s. without expenses.

COLONIAL NOTES.

SYDNEY.

DR. WOOLLS has published a complete list of the plants indigenous and naturalised in the neighbourhood of Sydney, arranged according to the system of Baron F. von Mueller, K.C.M.G. It is an enlarged and revised edition of a list published some years ago, and is now issued under Government auspices. The Tree Ferns and Cabbage Palms, we learn, are fast disappearing, and it is to be feared that the gigantic Lily, *Doryanthes excelsa*, and Bangalore Palm, *Ptychosperma Cunninghamii*, will share the same fate. *Bulbophyllum minutissimum*, the smallest of Australian known Orchids, has ceased to grow in a spot where it was found in 1849, but which is now in the midst of the city of Sydney. Other species are increasing rapidly, and introduced plants are dispossessing the natives. Of such introductions, 175 are enumerated in the list before us, the total number being given as 1465, distributed among 513 genera, and 110 orders. The list is a mere enumeration of names systematically arranged, and with an alphabetical index. The list will be very serviceable to working botanists, and important also as an historical record.

NOVA SCOTIA PROVINCIAL EXHIBITION.

A great exhibition of live stock, agricultural and horticultural products, arts and manufactures, is to be held at Halifax, from September 29 till October 2. The Hon. Sec. is Professor George Lawson. The horticultural section includes cereals, Flax, roots, Potatoes, garden vegetables, Apples (forty-five classes), Plums, and other fruits, cut flowers, and ornamental plants.

THE GRASSES OF NEW SOUTH WALES.

Mr. F. Turner, the botanist to the Department of Agriculture, is giving, in the *Agricultural Gazette* of New South Wales, a series of illustrations of grasses, with descriptions and notes on their importance in agriculture.

BOMBAY GARDENS.

Dr. Carstensen, the superintendent of the municipal gardens of this city, gives an interesting account of the establishment under his care. The temperature ranges from 93°, and a minimum of 63°, the average temperature of the year being 79°·7, the atmosphere usually laden with moisture; the annual rainfall about 82 inches, which falls very irregularly. The period of the monsoon, or rainy season—June to October—is that in which the luxuriant growth of all foliage plants, the splendid colours of their leaves and the profusion of choice flowers are most remark-

able. The most strikingly beautiful plants are creepers, such as species of *Bougainvillea*, *Thunbergia*, *Bignonia*, *Antigonon*, *Ipomoea*, &c. *Poinciana regia* has no rival in point of colour. Palms, of course, are elements of majestic beauty. Dr. Carstensen's paper was read before the Bombay Natural History Society in December, 1890.

FRUIT FROM TASMANIA.

Better even than Britain, and better certainly than most parts of Australia, are the soil and climate of Tasmania suited for fruit culture. Accordingly, when we visited the Shoobridges in their beautiful and fertile homes on the alluvials of the Derwent, in July, 1881, we found that besides hop culture, their enterprise included Apple and Pear orchards, which rank amongst the most extensive and the most productive in the world. By one of the great steamers of the P. & O. and Orient lines, which go to Tasmania regularly to load with boxes of fruit, the Shoobridges alone have shipped 2000 boxes of Apples. As each box contains a bushel, and each bushel is, on an average, made up of 150 fruits, the aggregate is 300,000 Apples. It seems a great point that each particular fruit, free from the slightest bruise, should be carefully wrapped in tissue paper. In Tasmania, we learn, an Apple tree begins to bear in its fifth year, and is in full bearing from the seventh to the twentieth year, the crop being counted by bushels—we feel afraid to say how many, from each tree. Of course, culture and manuring are necessary to enable the trees to produce good fruit in such plenty, although on many farms where labour was scarce, we saw trees laden with fruit amidst grass and weeds 2 feet in height. It was enough to make a man's mouth water to hear from Mr. Shoobridge of the bushels upon bushels of Apricots gathered this season from single trees. Apricots can be seen growing splendidly trained on walls at the exquisitely beautiful botanic gardens on the banks of the Derwent, near Hobart. Amongst the sights at Bushy Park are a fine Oak, an equally splendid Cherry tree, and Hawthorn growing so strong and tall that poles cut from the hedges are exported to parts of New Zealand, where all is grass. When Mr. Shoobridge, senior, originally settled at Bushy Park, he grew Strawberries in such abundance, that it did not pay to send the fruit to the Hobart market. When, more than a century back now, Britain commenced to send her convicts to Australia, and especially to Tasmania, it would have seemed a wild dream to anticipate that from the antipodean colonies, as the products of the enterprise and labour of communities of intelligent freemen the mother country should now be receiving supplies of gold and silver and copper, of grain and fruit and specially wool, the finest in the world. In the romance of emigration and commerce, there are few chapters so striking as that which records the settlement and advance of Australasia. *Condensed from the "Tropical Agriculturist."*

THE TRADE IN FLOWERS.

THE wholesale and retail trade and commerce in flowers, in this and other countries, both growing and cut, is very considerable; the quantity raised in gardens and greenhouses for sale being large. In all cities, where the atmosphere is inimical to vegetable life, continued efforts are made to supply the constant demand for flowers, by artificial means. The trade, both in plants and bouquets, especially in a populous place like London, is enormous.

At a moderate estimate, the value of the flowers sold weekly in the London markets exceeds £2000 to £3000; indeed, a London journal recently stated that during the season £5000 is expended daily on cut flowers. Besides those grown at home, large quantities are imported from Holland, Italy, and the South of France, for room decoration, posies, or ladies' bouquets, dress sprays, gentlemen's buttonholes, &c. The extension of the parcels-post to foreign countries has greatly facilitated the forwarding of cut

* Reported in the *Times Law Reports*, vol. vii., p. 468.

flowers for presents or for sale. The sales in the Madeleine Market, Paris, reach £25,000 a year.

In New York there is a great demand for flowers, and the expenditure on them is considerable. Two millions sterling is said to be invested on land, greenhouses, and stock in the wholesale florists' business there. Wealthy persons will often lavish hundreds of pounds on floral decorations. At dinners, weddings, and other festive occasions £800 to £1000 has been often spent for floral designs, bouquets, and parlour decorations. Lilies of the Valley, choice Roses, and Hyacinths, seem to be the favourite flowers there. Of the Orchid family more than 3000 species are known, mostly indigenous to tropical regions. Some of the rare Orchids are of great value, and most of the British and Belgian growers and dealers have paid collectors, travelling for them in different parts of the world to obtain new species.

The flower shows of the Horticultural and Botanical Societies of London and other cities, testify to what perfection our floriculturists have brought flowers, for beauty of bloom and variety of form and colour. The varieties of Roses, Tulips, Chrysanthemums, and other cultivated flowers, have been greatly increased. Although the Tulip mania, which rose to such an absurd height in Holland in the seventeenth century, has long since subsided, yet the rage for producing fine and choice Tulips still exists. There are more than 600 acres under Tulips in Holland, the exports of flowers and bulbs being to the value of £150,000 to £200,000, of which we receive the bulk.

Flowers are largely used for making odoriferous distilled waters, such as Rose water, Orange-flower water, Lavender water, and others. One known as Marmela water, is distilled from the flowers of the Bengal Quince in Ceylon, and much used by the natives for sprinkling. It is principally for perfumery that odoriferous flowers are most largely consumed, and every day some new and rare perfume is obtained. The south of France, Tunis, Algeria, and other countries on the Mediterranean shores, are chiefly occupied in this manufacture, carried on either by small itinerant distillers, or in more perfect factories.

Of Acacia flowers 150 tons are used yearly in Cannes; of Roses, 1300 tons were used at Nice in 1889; of Jasmine, Grasse, Cannes, and the adjoining villages, use up 180,000 pounds; and of the highly odoriferous Tuberose 35,000 pounds. When we consider that the annual value of the perfumery made in Paris alone exceeds two millions sterling, and our imports and exports average £120,000 each, besides what is used at home, the importance of flowers, the chief source, becomes evident.

Violets are much esteemed for their perfume; this flower is largely grown throughout the valley of the Thames for the London markets. Many acres are grown at Mitcham. Twenty tons of Violets are annually used at Nice and Cannes for perfumes; and about six million bouquets of Violets are sold annually in Paris. The Romans had a wine made of Violet flowers, and they are still used in Turkey in the preparation of sherbets. The most esteemed sherbet in Egypt is from a hard conserve of Violets, made by pounding the flowers and then boiling them with sugar. This Violet-sherbet is of a green colour, and is called the "Grand Seigneur's sherbet." A syrup of Violets is used medicinally, and the whole plant, in a dried state, is to be found as a drug in all the bazaars of Bengal. The petals of flowers are much used in Roumania in flavouring preserves; Violets, Lime flowers, and Rose petals are especially used. Having regard to their flavours, delicate odours, and agreeable appearance, the variety of confections made there is almost infinite.

It is not only for their beauty and perfume that flowers are important in commerce; they have other economic uses. In some countries, as in India and China, they are largely used as food; many have medicinal properties which give them a value, whilst others again yield colouring substances and dyes.

Saffron is but a small article of import here as a flavouring agent in several culinary preparations, but

it is imported into India yearly to the value of £75,000. Safflower, again, was one of the most important industries of Bengal, but aniline dyes have driven it completely out of the market. In place of an export worth £70,000 yearly, it has now dropped to less than £5000 last year. Another flower in which there is now an important commerce as an insecticide, is the florets of the disc of various species of Pyrethrum; these, when powdered, are offensive and stupefying to small insects. One million pounds of this powder are used in Russia, and half as much is exported. It has a large sale also in various European States, North America, and India.

A considerable commerce arises in what is known as "immortelles," or everlasting flowers, which are made into chaplets, wreaths, crosses, and other devices, to decorate the tombs and graves of deceased friends and relatives; especially in France, where the chief demand is in November. An acre of ground will yield 2 or 3 ton weight of these flowers. The head-quarters of this class of plant is South Africa.

The practice of sending wreaths of choice flowers to adorn the collins of friends has become very general of late.

Camomile flowers, Elder flowers, Marigolds, Lily of the Valley, Cowslips, Mallow, Crocus, Linden, Mulleins, and others, have recognised medicinal properties, but are not of any great commercial importance.

But there is a large trade also carried on in imitation or artificial flowers. This manufacture is a great industry in Paris and Lyons, giving employment to many thousand persons, the value of Roses made in France exceeding £1,000,000 sterling. The French long excelled in the exact imitation of the natural flower, their elegance and exquisite finish. Ten or twelve years ago we imported these artificial flowers from the Continent to the value of nearly £600,000, but this industry has been successfully taken up in England, and now our imports are one-half less.

In New York they have also gone into the manufacture, as the imports are subject to a heavy duty, but yet they receive them to the value of £200,000 yearly. Five thousand hands are employed in New York for numerous factories; the work turned out is valued at first-hand at £200,000, a sum doubled by the dealers and milliners, who make a large profit. *P. L. Simmonds.*

Obituary.

WE regret to record the death of Mr. GEORGE STEEL, nurseryman, of Richmond, which occurred on Thursday, July 23, at the age of eighty-two years. He had been in feeble health for three years, but had only taken to his bed about three weeks previous to his end. We are indebted to Mr. H. Herbst, an intimate friend of the deceased, for the following particulars concerning him:—

George Steel was born 1809 in Richmond, in a cottage near Lord Shaftesbury's estate, and close to the spot where Thomson wrote his "Seasons," a locality at that time entirely rural. His father founded a nursery in 1800, and was one of the first and largest growers of early Strawberries for Covent Garden Market.

In 1841, George and his brother William, who survives him, established a nursery on their own account in the Kew Road. George in all his life never quitted his native place except on a single occasion, and then for a month. The two brothers have carried on a successful trade for the last fifty years, and even now are famous for their Lilies and Rhododendrons. They were highly esteemed for their geniality and upright conduct as men of business; both were bachelors, and seemed to have most things in common, even to their quaint, old-fashioned style of dress. They were both most gentlemanly and kindly neighbours, but seemed to belong to a generation of long ago. Mr. William Steel, it is to be hoped, may still live long in his green old age. Mr. George Steel was buried at Kensal Green on Saturday the 25th ult.

CULTURAL NOTES.

ANDROSACE LANUGINOSA.

THIS very pretty little Himalayan plant is looking splendidly just now, with numbers of its little, pale-rose coloured flowers open, and is one of the most attractive plants on the rocky. There are many varieties of Androsace from the Pyrenees and Swiss Alps, but I think the one in question is as pretty and useful, as a rock-plant, as any of those. It has withstood, here in South Devon, the severity of the past winter very well, and has never looked better than at the present time. Its leaves are covered with long, silvery, silky hairs. It does best when planted in a sunny position, and in sandy loam, which should be kept moist. Some people recommend a little peat to be mixed with the loam, but it seems to thrive quite as well without it. It is a plant which is readily propagated by cuttings, and frequently the tufts which grow at the ends of the long stems, which are thrown out by the plant in great numbers, and on all sides, when the plant is in good health, will take root of themselves; but to make sure of them, they should be bent downwards. *H. G.*

CERASTIUM TOMENTOSUM.

THIS plant is a native of Southern Europe, and is naturally a little tender in this country. Portions of it occasionally perish, from the effects of severe weather. Cuttings of the plant may be taken in August, and put into light, sandy soil, in the open border, pressing the soil firmly about them. To make sure of the cuttings in the winter season, frame lights should be placed over them. The plant may also be increased by division. The replanting and filling-up of vacancies in edgings and beds should be done in the spring. *H. G.*

TRADE NOTICES.

MR. P. WEATHERS, formerly of the Royal Gardens, Kew, and late of Messrs. F. Sander & Co., St. Albans, has been appointed as traveller to Messrs. W. L. Lewis & Co., Orchid Importers and Growers, Southgate, London, N.

MR. JOHN M. THOMSON, for the last nine years gardener to His Grace the Duke of Grafton, Wakefield Lodge, Stoney Stratford, has succeeded Mr. Cole as manager, The Royal Nurseries, Ascot, Berks.

MR. JAMES COLE, lately with Messrs. Standish & Co., and previously with Messrs. Ireland & Thomson, Edinburgh, goes as manager to Messrs. John Laing & Sons, Forest Hill Nurseries, London, S.E.

MR. B. RANDLE, for the last eleven years foreman and traveller with Messrs. F. Sander & Co., St. Albans, has been engaged by Messrs. Seeger & Tropp, Orchid Importers, &c., East Dulwich, London, S.E.

MARKETS.

COVENT GARDEN, July 30.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

LARGE supplies of all classes of goods reaching us, with good trade generally. *James Webber, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

	<i>s. d. s. d.</i>		<i>s. d. s. d.</i>
Cherries, $\frac{1}{2}$ sieve.....	4 0-8 0	Melons	1 6-3 0
Currants, red, $\frac{1}{2}$ -sieve 3 9-5 0		Peaches, per dozen...	1 6-10 0
— black, $\frac{1}{2}$ -sieve ...	7 3-7 6	Pine-apples, St. Michael, each	2 0-8 0
Gooseberries, $\frac{1}{2}$ -sieve 2 0-3 6		Strawberries, per lb. 0 2-0 8	
Grapes	1 6-3 0		
Lemons, per case	15 0-25 0		

NOTE.—Bananas and Apricots differ in price so greatly, according to quality and quantity on sale, that no trustworthy quotations can be afforded.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers such as Arum Lilies, Asters, Carnations, etc., with their respective prices per bunch or dozen.

ORCHID-BLOOM in variety.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing various vegetables such as Artichokes, Beans, Beet, Carrots, etc., with their retail prices.

POTATOS.—The late rains interfered with the heavy supplies anticipated. Consequently prices have been fairly maintained from 90s. to 110s. for Beauties and Roses, and 120s. to 140s. for other Kidneys. J. B. Thomas.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots such as Aralia Sieboldi, Aspidistra, Bedding plants, etc., with their wholesale prices.

SEEDS.

LONDON, July 23. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report some inquiry for new Trifolium; the offerings at present are limited, and high prices are asked for same. English requirements will not, it is thought, be this season on an extensive scale. For Italian Rye-grass the tendency is strongly upwards. Mustard keeps steady. Rape seed is dearer. Lower rates are accepted for Canary seed, but in Hemp seed the recent downward movement has reversed itself. Blue Peas are used up. There is no change in feeding Linseed.

FRUITS AND VEGETABLES.

BOROUGH: July 29.—Quotations:—Cabbages, 2s. to 3s. per tally; spring Onions, 2s. to 3s. per dozen bunches; Peas, 2s. 6d. to 3s. per bushel; and 4s. 6d. to 5s. per bag.

SPITALFIELDS: July 28.—Quotations:—Cabbages, 1s. 9d. to 3s. per tally; Peas, 1s. 6d. to 2s. 6d. per bushel; do, 2s. to 3s. per sack; Broad Beans, 1s. to 2s. per bushel, and 2s. 6d. to 3s. 6d. per sack; Cauliflowers, 1s. 6d. to 2s. per dozen; French Beans, 4s. 6d. to 5s. per half-bushel; scarlet do., 4s. to 4s. 6d. do.; Turnips, 2s. 3d. to 3s. per dozen bunches; Carrots, 1s. 6d. to 2s. 6d. do.; spring Onions, 2s. 9d. to 3s. 6d. do.; Vegetable Marrows, 2s. per dozen; frame Cucumbers, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. to 1s. 6d. per dozen bunches; Cos Lettuce, 4d. to 8d. per score; Cabbage do., 4d. per dozen; Gooseberries, 3s. to 3s. 6d. per half-sieve; Raspberries, 25s. to 27s. per cwt.; black Currants, 6s. to 7s. per half-sieve; white do., 3s. 6d. to 4s. do.; red do., 3s. 6d. to 4s. do.; black Cherries, 4s. 6d. to 5s. 9d. do.; white do., 4s. to 6s. 6d. do.; foreign Tomatoes, 6d. to 1s. per box; English do., 1s. to 6s. 6d. per 12 lb.; English pickling Walnuts, 2s. to 2s. 6d. per half-sieve.

STRATFORD: July 28.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 3s. to 4s. per tally; Turnips, 1s. 9d. to 2s. per dozen bunches; Carrots, household, 1s. 6d. to 2s. 6d. do.; Onions, Egyptians

5s. to 6s. per bag; Apples, English, 2s. 6d. to 3s. 6d. per half-sieve; Green Peas, 3s. 6d. to 5s. 6d. per bag; spring Onions, 4s. to 5s. per dozen bunches; Cucumbers, 2s. to 3s. per dozen.

POTATOS.

BOROUGH: July 29.—Quotations:—Jerseys, 150s. to 160s.; Cherbours, 100s. to 120s.; Essex and Kent Regents, 90s. to 100s.; Hebrons, 100s. to 120s.; Early Rose, 90s. to 100s.; Kidneys, 120s. to 140s. per ton. Old Magnams unaltered.

STRATFORD: July 28.—Quotations:—Hebrons, 4s. 6d. to 5s. 6d. per cwt.; white do., 100s. to 120s. per ton; Roses, 4s. to 4s. 6d. per cwt.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending July 25, and for the corresponding period last year:—1891. Wheat, 38s. 6d.; Barley, 25s. 7d.; Oats, 21s. 9d. 1890: Wheat, 35s. 0d.; Barley, 25s. 2d.; Oats, 19s. 10d. Difference, Wheat, +3s. 6d.; Barley, +3s. 5d.; Oats, +1s. 11d.

HAY.

Averages.—The following are the averages of the prices paid at the various metropolitan markets during the past week:—Clover, prime, 80s. to 102s. 6d.; inferior do., 40s. to 75s.; best, 60s. to 90s.; inferior do., 25s. to 50s.; and straw, 20s. to 4s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table showing weather data for various districts, including temperature (Day-deg., Night-deg., Accumulated), rainfall (No. of Rainy Days since Jan. 4, 1891), and bright sun (Total fall since Jan. 4, 1891).

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 25, is furnished from the Meteorological Office:—

"The weather was cool and unsettled during the greater part of the week, with thunderstorms and heavy showers in nearly all districts. Towards the close of the period, however, a considerable improvement was recorded.

"The temperature has not differed materially from the mean, excepting in 'Scotland, E.' where the average has been 2° in excess of the normal. In other districts the departure from the mean has in no case exceeded 1°, and in 'England, N.E.,' 'England, N.W.,' and 'Ireland, S.' it has been quite inappreciable. The highest readings were observed either at the beginning or end of the week, but the thermometer did not reach 75° in any district, and

in the west and north of Scotland, the north-west of England, and the Channel Islands, it failed to reach 70°. On the 22nd the maximum readings were below 65° in all but the central and southern parts of England. The lowest of the minima, which occurred on various dates, ranged from 45° in 'England, N.W.,' and 'England, S.W.,' to 55° in the 'Channel Islands.'

"The rainfall has been rather more than the mean in the north of Scotland and the eastern and western districts of England, but less in all other parts of the country. In 'Scotland, W.,' the deficiency has again been very large.

"The bright sunshine has been less than the mean in all districts, excepting 'England, N.E.,' and 'Scotland, W.' The percentage of the possible amount has ranged from 13 in 'Scotland, N.,' and 22 in 'England, N.W.,' to 37 in 'England, S.,' and 40 in the Channel Islands."

ENQUIRY.

"He that questioneth much shall learn much."—Bacon.

GLASS FOR GLAZING A PALM HOUSE.—Would any correspondent kindly inform "R. S." the best kind of glass for glazing a conservatory 36 by 66, average height 17 feet, with three gables facing south, and built principally for a collection of Palms.

NOTICES TO CORRESPONDENTS.

AUBERGINE: W. A. C. The method of culture is identical with that usually pursued with Tomatoes in pots, or Capsicums. They must be fully exposed to the sun—say, against, or in front of a south wall. Do not overpot the plants, or the blooms will be few, and growth large. In all but the warmer parts of the country the plants must be grown under glass. Six or eight fruits on a strong plant are a sufficient crop.

BOOKS: W. N. The Orchid Manual, by B. S. Williams, Paradise and Victoria Nurseries, Upper Holloway, N. Price, about 5s.

CLIMAX WEEB KILLER: Boundary Chemical Company. From personal trial we can report this to be effective in removing the green coniferoid growth from the surface of damp stones as well as in destroying weeds. It must be remembered that this like most of its class is a powerful poison, and should be handled carefully accordingly.

CORRECTION.—Royal Western Horticultural Show, Gardeners' Chronicle, p. 113. In the fruit and cut flower classes, for Mr. Cox, read Mr. A. W. Cove. The Peach Corytoni was raised at Pentillie Castle, and not at Powderham Castle.

CRYSTAL PALACE SHOW: H. R. H. The next show occurs on Saturday, August 15.

CUCUMBER ROOT: W. G. Apparently the work of some insect or grub which has attacked the roots. Are the leaves healthy?

FRESHLY-IMPORTED ORCHIDS: T. C. P. If you keep them somewhat moist the pseudo-bulbs will become plump, and put forth roots in the Melon-frame. Some small amount of air should be afforded.

FUNGUS: F. Townsend. A species of Geoglossum, of which we will endeavour to determine the species next week.

INSECTS—PARSNIPS: G. T. The insects which have attacked your Parsnips are a species of aphid, apparently A. Pastinacae; water the plants with gas-tar water and soapsuds.

LARCH DYING: S. E. The work of mice. Judging from the lichen-covered plants that were sent, the land must be ill-drained.

LETTUCES: F. Branton. A very excellent strain of apparently Paris White Cos.

MUSHROOM INSECT: T. Slater. Your Mushrooms are infested with a small species of mite, Hlophora contractilis? belonging to the great division of beetle-mites, so-called from their being covered with a thick, rigid, dark-brown, scaly coat, and which, like many other species, breeds with great rapidity. Bake the earth. I. O. W.

NAMES OF FRUITS: J. E. N. P. Fruit smashed, but not Princess of Wales.—F. C. The Apple you send is one of the latest keepers we have ever seen, though of indifferent quality.

NAMES OF PLANTS: Correspondents whose questions are unanswered are requested to consult our next week's issue.—*J. Kent*, 1, *Aerides crispum*; 2, *Aerides maculosum*; 3, *Cypripedium Lowii*.—*A. W.*, 1, *Lysimachia thyrsiflora*; 2, *Corydalis lutea*; 3, shrub, *Picea orientalis*. What you call a fungus is an aphid allied to that which causes the American Blight in Apples. Use petroleum spray.—*Miss F.*, 1, *Veratrum nigrum*; 2, *V. album*; both highly poisonous.—*W. L.*, *Stanhopea tigrina*.—*C. H.* One of the so-called *Retinosporus*, apparently that named Tom Thumb. It is merely a peculiar stage of growth of some *Thyridium*, probably *T. occidentalis*, as your specimen shows.—*Lilium* should ask such questions of the Editor, not of the Publisher. The name of the Lily is *L. Hansonii*.—*J. T. S.*, 1, *Pyrethrum Parthenium* double fl.; 2, *Claytonia virginica*; 3, *Clematis*; 4, An Umbellifer, not recognised; 5, *Campanula persicifolia* alba; 6, *C. persicifolia* var. *calycanthema*.—*J. S.*, *Francoa sonchifolia*; 2, *Spiraea arifolia*; 3, *Betonica carnea*; 4, 5, 6, all forms of *Veronica longifolia*.—*H. R. H.*, *Stanhopea aurea*, *Epidendrum fragrans*.—*W. B.*, 1, *Polystichum angulare proliferum*; 2 and 3, forms of *Lastræa Filix-mas*; 4, *Polypodium vulgare*; 5, a small frond of *Athyrium Filix-femina* and one of *Lastræa Filix-mas* together.—*W. J. W.*, 1, *Lælia crispa*; 2, *Adiantum concinnum latum*; 3, *Selaginella viticulosa*; 4, *Adiantum fragrantissimum*; 5, *A. decorum*; 6, *A. tenerum*.

PLANTAINS IN A LAWN: *H. W.* Put some vitriol in an earthen pot, and with a pointed stick, or piece of wire, let fall a drop of the liquid into the heart of the plant; or, in September, spud them up, put a little fresh loam on the bare places caused by their removal, and sow a pinch of lawn grass seeds thereon.

POTATO MILDEW: *B.* The formulas vary in their proportions. Recent experiments in France seem to show that the proportion of copper sulphate often used is needlessly large. Try sulphate of copper 3 lb., quicklime 1 lb., water 20 gallons, or it may be used in the form of a powder, with or without sulphur, as in Tait's Anti-blight Composition, a convenient form of administration.

POTATOS: TUBERS ON HAULMS. *T. P.* Very common where the original tuber has been injured by a cut by a spade, or even by wireworm.

QUEEN PINE-APPLES: *R. W.* It is rather late in the season for the above; but as the fruits now showing should ripen in the course of the next three or four months, the plants will be worth keeping. Keep the glass clean, and shade as little as possible.

ROSES DYING OFF: *Foreman.* We have submitted your specimen to one of our largest growers, and have carefully examined it ourselves, but we regret we cannot give you any precise information as to the cause.

UNDERSELLING: *C. B.* There is, so far as we know, no code of ethics in commercial matters to prevent this, but if your neighbour is, as you say he must be, selling at a loss, go you and buy of him, do not continue to grow for yourself under such circumstances. You cannot afford to grow what does not pay you, any more than you can expect to extend your business without advertising.

THE STOTT PATENT DISTRIBUTOR, PATENT SPRAYER, PATENT SYRINGE, KILLMRIGHT,

BEST Insecticide for Destruction of Caterpillar and all Insect Pests, and Prevention of Mildew. Crosswood Park, Aberystwith, S. Wales.

Sirs, July 7, 1890. Thanks to your "Stott" Distributor, our Wall trees and Roses were never cleaner than at the present time. We have a long border of Roses, about 150 yards long, and one filling of the Distributor with "Killmright" will cleanse them thoroughly. I have been asked by many how the Roses are so clean, and I at once tell them to get one of the "Stott" Insecticide Distributors, and join to their hose, and they will soon find the benefit. I have used it all round the walls, and it has cleansed everything. I think it a very useful invention, and shall recommend it to all my friends.—I remain, yours truly, **R. C. WILLIAMS.**

Gardener to **The Earl of Lisburne.** Retail from Ironmongers and Seedsmen; Wholesale and Retail from the Stott Distributor Co. Ltd., Barton House, Manchester.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL. 15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) **A. MACKENZIE,**" of Messrs. Mathew & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) **B. S. WILLIAMS.**"

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from **B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London;** and from **WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.**

"Nothing Succeeds like Success."
HUGHES' (SOLUBLE) INSECTICIDE FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsmen & Chemists, 1/6, 2/6, & 4/6; 1/2-gallon 7/6, 1-gallon 12/6, or less in larger quantities.

A Treatise on **FIR-TREE OIL** as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to

E. GRIFFITHS HUGHES, Victoria-st., Manchester. Wholesale from all the London Seed Merchants and Patent Medicine Houses. **NEW YORK—A. ROLKER & SONS.**

GEO. GARSIDE, Jun., F.R.H.S., Leighton Buzzard, Beds.

THE JUBILEE YEAR OF THE GARDENERS' CHRONICLE.

THE *Gardeners' Chronicle* was founded, in 1841, by the late Dr. Lindley, Sir Joseph Paxton, and others. It proved a great success from the first, having then few competitors. As the exigencies of the time have required, it has been trebled in size, so far as horticultural matters are concerned. Illustrations which at one time were few, and given only at intervals, are now numerous and regularly issued. The price has been reduced one-half, and though there are now many competitors in the field, the *Gardeners' Chronicle* is generally recognised as the leading authority in all matters relating to Gardening, Garden Botany, Forestry, and the sciences connected therewith. What others think of it may be judged from the following from among many unsolicited expressions of opinion:—

EXTRACTS FROM THE PRESS.

"THE *Gardeners' Chronicle* has faithfully held to its promise. It is still, to-day, the best gardening journal, being indispensable equally to the practical gardener and the man of science, because each finds in it something useful. We wish the journal still further success."—*Garten Flora, Berlin, January 15.*

"The *Gardeners' Chronicle* celebrated, on Jan. 2, the fiftieth anniversary of its foundation. This is, in [English] garden literature, an unique event. . . . The publication is one of special excellence."—*Vossische Zeitung, Berlin, January 7.*

"The *Gardeners' Chronicle*, one of the most justly renowned horticultural journals of the world, celebrates the fiftieth anniversary of its foundation. The career of this publication, which is an authority in scientific as well as in practical matters, has been most successful and interesting. . . . With such a past, there can be no doubt as to its future."—*Revue Horticole, Paris, January 16.*

"The *Gardeners' Chronicle* is known wherever intelligence in horticulture is appreciated."—*Mechan's Monthly.*

"The first issue of the *Gardeners' Chronicle* for the year is a jubilee number devoted largely to a commemoration of the fiftieth anniversary of that journal's first appearance. Founded by Dr. Lindley and Sir Joseph Paxton, its policy has always been directed by men of accurate knowledge and scientific temper. Its trusted correspondents have been among the foremost of skilled cultivators and recognized authorities in the sciences related to horticulture. During its life of half a century, its influence has tended to elevate and dignify the art of horticulture, not only in England, but throughout the world, and it was never more worthy to command respect than under its present management. Our venerable contemporary is to be congratulated on the possession of so honourable a history, whilst its future is bright with the promise of ever-increasing usefulness."—*Garden and Forest (New York), Jan. 21.*

"We wish to give ourselves the pleasure of recognizing an event in the career of a respected contemporary. . . . The *Gardeners' Chronicle* is the senior by only seven years of the *Journal of Horticulture*, and, to speak paradoxically, we may venture

to say, that both these journals are as young as ever, and disseminate, each in its own way, matter of interest to botanists and horticulturists throughout the world, where the science of botany is studied, and the art of gardening is practised by the community."—*Journal of Horticulture, February 5, 1891.*

"THE JUBILEE OF THE 'GARDENERS' CHRONICLE.'—On January 2, 1841, appeared the first number of a weekly paper which, thanks to the scientific research and practical knowledge of its editors, soon became, and has ever since remained, the principal horticultural medium in England."—*Illustration Horticole, Brussels, Jan. 1891.*

"One of the best conducted English horticultural papers, the *Gardeners' Chronicle*, celebrated the fiftieth year of its existence on January 2. This journal was called into existence by Dr. Lindley and Joseph Paxton. Two of the first and most industrious assistants were the recently-deceased landscape gardener Marnock in the practical part, and James Bateman, who published a series of interesting articles on epiphytal Orchids. Of other eminent writers, there are mentioned the names of Charles Darwin, Dean Herbert, Sir W. Hooker, who, in 1841, was appointed Director of the Royal Botanical Garden, Kew; Sir J. Hooker, Professor Danby, Dr. Royle, Henslow, MacIntosh, Curtis, Phillip Frost, Robert Thompson, Robert Fortune, and Berkley."—*Moller's Deutsche Garten Zeitung, Erfurt, February 1, 1891.*

"For the past half a century, the *Gardeners' Chronicle* has been the leading horticultural and botanical newspaper in the United Kingdom. . . . With such a talented proprietary and staff of editors, it is not surprising that the paper was at once recognized, and took up a leading position as the first horticultural journal of the kingdom. Its success has been very great. . . . Very few of the first working printers on the paper are left to witness the prosperity of the venture, except the writer of these lines (the editor of the *Press News*). . . . The *Gardeners' Chronicle* is still recognized as the leading horticultural journal of the kingdom."—*Press News, January, 1891.*

"The *Gardeners' Chronicle* has just celebrated its jubilee, its first number having appeared January 12, 1841. The founders were Dr. Lindley and Sir

Joseph Paxton. It is to be congratulated upon its long and eminent list of contributors, and upon its constantly increasing usefulness. It is one of those gardening journals that have become a necessity, not only to the practical gardener, but to the professional botanist as well."—*The Botanical Gazette (American), February, 1891.*

"This important journal renders great service in acting as an intermediary between botanists and horticulturists, impressing on the one the true principles of classification and nomenclature, and on the other, the fact that the observation of living plants in the garden teaches many things which cannot be learnt, either in the herbarium or the laboratory, facts which the new generation is disposed to overlook."—*Alphonse de Candolle, Geneva.*

"Let me offer my best felicitation on the semi-centenary jubilee of your splendid *Chronicle*, which you have edited with so much talent, knowledge, and discrimination, for so long a while as the worthy successor of the great Lindley. Wishing the *Gardeners' Chronicle* also in future a splendid success under your able leadership, I remain, Ferd. von Mueller, Melbourne."

"You have brought the *Gardeners' Chronicle* into an admirable condition of prosperity and authority. Of all analogous publications, the *Chronicle*, with no possible reservation, takes the lead. It is more widely read than any of the horticultural journals, owing to its wider circulation. The matter is the most varied, and the illustrations the most correct and elegant. What I wish is, not the continuance and enhancement of your success, for that is certain, as the future will prove, but the continuance of that marvellous energy which has had such excellent results already."—*Maxime Cornu, Director of the Jardin des Plantes, Paris.*

"In 1841, Lindley and Sir Joseph Paxton enriched horticulture with this high-class periodical, in which science has always taken an equally important part with practical information. The issue for the 3rd of last January was devoted to the celebration of the anniversary. The *Gardeners' Chronicle* cannot fail to prosper under its present management, which is conducted with unusual ability and skill."—*Le Jardin, Paris, March 20, 1891.*

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeated Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER.**

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. State salary, &c.—W. HARRIS, 7, Catherine Street, Strand, W.C.

HOLLOWAY'S OINTMENT.—Go where you may, in every country and in all climes, persons will be found who have a ready word of praise for this Ointment. For chaps, chafes, scalds, bruises, and sprains, it is an invaluable remedy; for bad legs, bad breasts, and piles, it may be confidently relied upon for effecting a sound and permanent cure. In cases of puffed ankles, erysipelas, and Rheumatism, Holloway's Ointment gives the greatest comfort, by reducing the inflammation, cooling the blood, soothing the nerves, adjusting the circulation, and expelling the impurities. This Ointment should have a place in every nursery. It will cure all those manifold skin affections, which, originating in childhood, gain strength with the child's growth.

FOR PLANTS.
QUICK. LASTING. ECONOMIC.

The Gardens, Saxon Heath, Haulhurst, Kent, March 11, 1891.
DEAR SIR.—Having used your "Clay's Invigorator" for some time, I am exceedingly pleased with the results obtained from it. As an Exhibitor I have used it upon most sorts of Vegetables with great advantage; also upon many sorts of Stove and Greenhouse Plants, Melons, Cucumbers, Tomatos, Pot Strawberries, Chrysanthemums, &c. For Lawns it has a quick and beneficial effect. For Amateurs and those with small gardens, where there is a difficulty in obtaining stable or farm-yard manure, your "Invigorator" ought to be of special value, as it is clean in use, easy of application, and reasonable in price.—Yours respectfully, J. GILMOUR, Gardener to the Right Hon. G. J. GOSCHEN, M.P.

Sold by Seedsmen, Florists, and Nurserymen, or direct from the Works, in 6d. and 1s. packets, and SEALED BAGS:—
7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs.
2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free on receipt of ONE SHILLING by the MANUFACTURER—

The Stott Fertiliser and Insecticide Co., Limited.
Gentlemen,—I am much pleased with your Insecticide, Killmright. I have had two 14-lb tins, and given it a fair trial on various insects, and am-4 complimentary you on its efficacy. It is the best Insecticide I have ever used, and the cheapest, which says a great deal for it for dipping plants for aphids, scale, thrips, &c. As your directions say, it is immediate death to all, with no bad effect on the most tender plants. I mean to get your Syringe, &c., and use no other Insecticide.

P.S.—I have recommended your Killmright to a lot of my friends, who are greatly pleased with it.—Yours faithfully,
J. YOUNG, Head Gardener to the above Society, &c.
Highest Award, Spraying Competition, Crystal Palace Horticultural Appliances Exhibition.

**THE GREAT CONTEST
 FOR
 DINNER TABLE DECORATION,**

*Pronounced the Most Beautiful
 and Perfect ever seen.*

There is no one so well known for her almost
 unbroken success amongst the most important
 exhibitors, for artistically arranging flowers for
 the best effect on the dinner table, as Miss
 HASSELL, although beaten on this occasion by
 S. SPALDING, Esq., of South Darenth, and
 W. L. BUSTER, Esq., of St. Mary Cray, all in
 Kent, who were first, second, and third, respec-
 tively, amongst thirteen competitors.

All, or nearly all, of the flowers used on the
 above occasion, and for years, by the three
 successful competitors above mentioned from our
 nurseries (particularly Miss HASSELL, who is loud
 in pronouncing her long-continued success is
 mainly due to the lovely flowers supplied by us).
 This little revelation at once shows another
 instance of the completeness and the importance
 of our establishments for everything required
 for the garden.

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 8, 1891.

FRUIT PACKING.

IT is certain that there is still much to be
 learned in respect to methods of treating
 Apples and other fruits in order to preserve
 them for market. The importance of the subject
 from a chemical standpoint has been acknow-
 ledged by Professor F. H. Storer, who has
 endeavoured to answer the question, "What
 would be the best treatment for Apples and
 other fruits before (as well as after) packing, to
 prevent decay?"

The necessity of handling fruit gently and of
 keeping it cool and not too dry is generally
 recognised, and it is known, too, that in so far
 as may be possible it will be well to shield fruit
 from "germs" which infest the air. But the
 question how best to put these ideas into practice
 is still open, and not a little complex.

An Apple or any other fruit is really a living
 thing. No matter how ripe it may be, it is still
 alive, and undergoing progressive physiological
 changes, which are like to those which occur in
 plants and animals. Long after it has been
 plucked from the tree, the Apple continues to
 develop and to ripen, until it has passed through
 the seven ages which the poet tells of, and has
 run out a term of life which may justly enough
 be compared with the threescore years and ten
 which span our human existence. It is hardly
 to be supposed that it would be possible wholly
 to arrest this natural course of life of the ripen-
 ing Apple, as a means of preserving it in an
 edible condition. To stop the life-action of the
 fruit would cause its death, and death would be
 followed by chemical changes which could hardly
 fail to alter in some way the texture and flavour
 of the materials of which the fruit is composed.
 The rapidity of the change would very greatly
 depend upon external circumstances.

It is true enough that, by keeping the Apple
 cool, it may be made to ripen with extreme slow-
 ness, and thus be granted a long lease of life.
 This is done to-day in many fruit-preserving
 establishments; and it is to be noted that,
 besides putting off, as it were, old age and decre-
 pitude, the method of refrigeration has the
 further merit of keeping quiet, or inactive, the
 microscopic organisms which cause decay.

In cases where refrigeration is impracticable,
 the aim should be to shield the fruit from the
 attacks of the microscopic organisms just re-
 ferred to. Many kinds of Apples—the Russet,
 for example—are tolerably well protected already
 by tough, and, as it were, varnished skins, which
 act as armour to repel the pigmy foe. Every-
 one knows, for that matter, how much more
 quickly decay sets in when the skin of the Apple
 is broken, or even bruised, than when the skin is
 whole. Since the air of most localities, and
 especially of fruit-rooms badly ventilated, con-
 tains many germs of the organism which causes

decay, some slight advantage is probably gained by keeping fruit covered in order to prevent the germs from falling upon it. The putting of fruit into boxes or barrels, the burying of it in sand, or the mere throwing upon it of a layer of straw, or a clean cloth, or some boards, probably helps to shield it. But care must be taken not to pack or cover up fruit in such wise that the conditions shall be favourable for its sweating, for whenever moisture is deposited upon fruit, decay is greatly favoured. It is not well either to leave fruit lying in great heaps or to pack it in very large boxes, lest heat enough be developed to hasten the ripening and to bring on decay, the germs which attach themselves to the fruit gathering strength from the favourable conditions which surround it.

One fundamental trouble is that there are always some germs or microbes clinging to the fruit itself when it is taken from the tree, which are ready to avail themselves of any circumstances, such as a conjunction of moisture and warmth, which may be helpful for their development. If it were but possible to "sterilise" fruit completely, namely, to free it from all adhering germs, it would be a comparatively easy matter to hinder decay by keeping fruit in receptacles to which air should have no access until it had been filtered or made to pass through some disinfecting or germicide liquid.

Indeed, a layer of cotton-wool placed upon fruit that had been completely freed from organisms—supposing it were practically possible thus to free it—would be sufficient to prevent it from rotting. The great difficulty in this matter is to get a fair start.

It is not improbable that some antiseptic agents may one day be discovered, which when applied directly to fruit may serve a useful purpose for killing the attached germs and for retarding decay. But there will be needed agents which while killing the peccant microbes shall not kill at the same time the living cells of which the fruit itself consists. A useful approximation to this suggested system of antiseptics and coverings is seen to-day in the use of salt-marsh hay, which acts fairly well for preserving fruits that are packed in it. This material has the advantage of being both hygroscopic and germicide in some small degree.

For fruits which are liable to begin to decay at the core, as happens with many Pears, it is well to smear the ends of the stems with melted wax, or with a hardening varnish, to prevent the entrance of microbes through this unprotected inlet. *J. J. Willis, Harpenden.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM HENNISII, *Rolle, n.sp.**

This is a very elegant and pretty little *Odontoglossum*, sent to Messrs. Charlesworth & Shettleworth & Co., of Heaton, Bradford, and of Clapham, by

* *Odontoglossum Hennisii*, n. sp.—Pseudobulbs densely tufted, ovoid-oblong, subcompressed, 1½ inches long. Leaves oblanceolate-linear, acute, 4–6 inches long, 6–10 lines broad. Scape 8 inches high, 6-flowered. Bracts lanceolate, acute, 2 lines long. Pedicels 1 inch long. Sepals spreading, lanceolate, acuminate, a little more than 1 inch long, yellow, with a large brown area near the base and another about the middle. Petals rather smaller, yellow, with several brown spots in the middle and three or four brown lines near the base. Lip free, unguis 2 lines long, limb spreading, three-lobed, 10 lines long by 8 lines broad; side lobes rounded, denticulate; front lobe triangular-ovate, very acuminate; disc with numerous slender somewhat branched filaments from 1 to 2½ lines long; ground colour white, the front lobe reddish-brown, also the basal part of the disc and a few spots of the same colour on the margin of the side lobes. Column clavate, 7 lines long, yellowish-white, wings brown, nearly entire, the triangular acute apex slightly denticulate. Native of Peru or Ecuador. *R. A. Rolfe.*

their collector, Mr. W. Hennis, from the southern part of the Andes, either Peru or Ecuador. In size and colour it closely resembles *O. odoratum*, Lindl., but its real affinity is with *O. crinitum*, Rehb. f., as the shape of the lip is very similar in the two, while both possess a peculiar bearded crest, consisting of numerous filiform or thread-like hairs. *O. crinitum* is a native of New Granada, and has a very zigzag rachis with very rigid spreading distichous bracts, and the flowers rather crowded, while in our novelty the rachis is nearly straight, the flowers larger, and far more distant, and the bracts different. In *O. crinitum* also the crest is more densely bearded. It is a very interesting and attractive little plant. *R. A. Rolfe.*

ASH ANALYSIS OF WHITE GLOBE ONIONS.

From several barrels of White Globe Onions grown at Green's Farms were selected twenty-two bulbs of fair size, which weighed five pounds and one ounce.

After drying and pulverising them, a weighed sample of the powdered material was burned with the usual precautions, and the ash submitted to analysis with the following results:—

PER CENT. COMPOSITION OF THE PURE ASH. (Station No. 3905)

Potash	43.49
Soda... ..	1.26
Lime	10.87
Magnesia	4.48
Oxide of iron	1.07
Phosphoric Acid	19.03
Sulphuric Acid	15.98
Chlorine	2.33
Sand and Silica	1.96
	100.53
Deduct oxygen equivalent to chlorine	53
	100.00

The fresh Onions contain .27 per cent. of nitrogen and .48 per cent. of pure ash.

From these data are calculated the quantities of these ingredients contained in one ton, 2000 pounds of Onions as follows:—

NITROGEN AND MINERAL MATTER IN ONE TON OF ONIONS (BULBS).

Nitrogen	2.70 pounds.
Phosphoric Acid92 "
Potash	9.03 "
Soda06 "
Lime52 "
Magnesia21 "
Oxide of iron05 "
Sulphuric Acid77 "
Chlorine11 "
Sand and Silica09 "

American Bulletin.

FRANÇOIS LEGUAT AND HIS PLANTS.

(Continued from p. 96.)

THERE is at Rodriguez, as also in the Ile de France, and at Bourbon, a shrub which may be said to be the finest of all the Brambles. At the Ile de France I was told that they call it Bois de Sentier,* because no one can approach it without feeling the pricks of its spines, with which the stem, the leaves, and the fruits are bristling. At Bourbon it is named Cadoque. It is absolutely the same as that which is named Caretti, in the second volume of the *Hortus Malabaricus*—Inimboy, at Brazil, according to Marcgrave, Liv. i. chap. 8, and the Bon Duc of the great species, by other modern naturalists. I have seen them in our islands grow to a height of 7 or 8 feet. The seed of the Caretti of Rodriguez is larger than that of the two other islands; its colour of dark grey predominates over the white, whereas at Bourbon and in the Isle of France it is nearly green. In fact, at Rodriguez it has a flattened elliptical shape, and in the other islands that of an elongated ellipsoid. This seed is a very good vermifer; the wood and root in decoction form a good sudorific. It may be

* Bois de Sentier. *Scutia Commersonii*. Cadoque or Bonduc, *Cesalpinia Bonducella*.

added that in our islands this tree is a sovereign remedy for gonorrhœa, however virulent; some people extend its virtues even to other venereal diseases. I have opened many fruits of the Bonduc. I have always found two seeds, never room for a third. I have never seen this shrub in blossom.

That which I am told in Rodriguez is called Bois Hollandois,* is a very small tree or shrub, from 4 to 5 feet in height, including its branches; the leaf resembles somewhat that of a Peach; it is a bright green, and of agreeable aspect. These trees form small forests, very inconvenient to pass through, or, I should say, traverse. Their stems, although small, are very tough, and I am told that the wounds which they occasion to those breaking through them are extremely dangerous. I have not seen them in blossom or fruit.

The Bois de Cannelle † is a handsome shrub, not even so high as the Bois Hollandois; it only puts forth leaves at the extremity of its branches, in a way that it appears like the hand of a man. At the extremity of each branch is a bunch of leaves; these leaves are of a very fine bright green, and coated with a species of gum. The wood is aromatic, and very good, it is said, for baths. In addition, this shrub no more resembles the Cinnamon (cannelier) than does the Bois d'Olive to the veritable Olive tree. M. l'Abbé de la Caille (*Journal Historique*, p. 226) speaks of another Bois de Cannelle, which I have not recognised.

The Box ‡ of Rodriguez forms a very fine shrub; it otherwise appears to me to resemble absolutely our own, excepting that the fruit of that of Rodriguez has not the species of (*piéd de marmite*) tripod which is remarkable in ours, the three points, which form three feet, being close together, and nearly touching near the heart or eye of the fruit.

There is another shrub closely resembling the preceding. I have, indeed, been deceived by it at first sight. I have been surprised by the facility with which I pulled off the branches. Scarcely had I lifted with a knife some part of the bark when my fingers were found as if bleeding. I have thought I had been wounded. On washing them in a neighbouring rivulet, there did not appear the least sign of a wound. The outer skin of this Boxwood, if I may use the term, covers a thicker skin, filled with a sort of gum, very sticky; the juice of this gum was red, its odour resinous, and very strong. It is said that this shrub becomes a tree, and that then its leaves resemble more nearly those of the Box; it is also said that its flowers have a very sweet smell.

Rodriguez, besides, produces Sugar-canes, Mustard plants, whose leaves we eat in the shape of Spinach; pepper in Pimento, and especially small pepper, called Piment du Diable,§ or Piment enragé, on account of its hotness; Patates (a species of *Convolvulus*), which some call Patates à Durand, whose young leaves applied within to ulcers are an excellent suppurative, as I have myself experienced; but applied without are, I am told, a sovereign desiccative. Sow-thistle; Purslain, which is not regarded as wholesome, contrary to the authority of François Leguat, who valued it highly; *Scolopendria*, whose fronds are 4 or 5 feet long, without being jagged; Capillaires, Prickly Poppies, Poppies, Chiendent, Tobacco, a tree, rather nice, from which they served us its leaves,|| cooked like Spinach, under the name of Senna leaves, which name sufficed to disgust me with the dish, although I was persuaded that it was not the veritable Senna; in short, the island produces an infinity of other trees, shrubs, and plants, among which I am assured that there are only two which can be regarded as dangerous. I could not ascertain their names. I felt much difficulty in defining the first of these two poisons. It is a species of *Dithymale*, which has not any leaves, or, as

* Bois Hollandois. What is this he?

† Bois de Cannelle, *Laurus cupularis*, or *Oreodaphne*?

‡ Bois = *Murraya exotica*.

§ Piment petit = *Capsicum frutescens*. Gros Piment = *C. cordiforme*.

|| Probably *Moringa pterygosperma*, or Brède morouge, cultivated and eaten as Spinach.

one might say, whose leaves are cylindrical, 2 or 3 inches long, of the thickness of a line. Each leaf or each stalk is terminated by a sort of dome, which is not thicker than the circumference of the stalk; above this dome is produced a button, which encloses apparently the germ of the flower and of the fruit. The milk of this plant deprives one of eyesight if touched by it, and it is added that the milk of the woman is the only remedy known to recover the sight.

The other dangerous plant is a poison properly so-called, its trunk is about the thickness of a Briar, it grows to 3 or 4 feet above the ground, it cannot support its branches, and attaches them, if it can, to trees and neighbouring shrubs, otherwise it leaves them to fall and creep on the ground; the leaves have some resemblance to those of the Orange, except that they are more rounded above. By stripping the leaves, the bark, and even the wood and roots of this tree, they extract a juice which is an extremely prompt poison. I have not seen at Rodriguez any flower like that of which François Leguat speaks. (Vol. i. p. 109.)*

This is all that the Abbé Pingré tells us of the flora of Rodriguez during his stay there, and it is interesting as a small contribution towards the chronological history of the plants in the Mascarene Islands. Perhaps some contributor to the *Gardeners' Chronicle* may help to identify some of those plants

According to M. Ernst Benary, of Erfurt, who sent it out in 1886, and who has obligingly supplied us with information concerning it, it was raised in Germany, and is "presumed to have sprung" from *M. alpestris robusta grandiflora* (Eliza Ponrobert), a

FIG. 19.—"HEN AND CHICKENS" FORGET-ME-NOT, MYOSOTIS VICTORIA.

Showing the extremity of the main stem, with the central flower, and the lateral racemes, in which the flowers have ten-lobed corollas, &c. (See text).

name so formidable that we do not wonder the plant is a deformity! It was fully described in Mr. Benary's list of novelties in 1886, and again in his general catalogue for 1886-1887. "It comes quite true from seed."

Last year and this the plant was shown at the Royal Horticultural Society by Mr. W. Marshall from his garden at Bexley, where it originated no one knows how amongst plants of ordinary *M. alpestris*. Mr. Marshall did not, so far as he knows, receive seeds from Germany or elsewhere. The plant received a First-class Certificate when last shown under a name which it is desirable not to perpetuate, as that of "Victoria" has clearly the right of precedence. Mr. Jones, gr. to Edmund Hyde, Esq., of Ealing, kindly contributes the following information as to its culture:—"The plants grow about 5 to 6 inches in height, forming compact little bushes covered with flowers. Ours have received the same treatment as the old variety *dissitiflora*. It is quite hardy, having withstood the late severe winter without any protection whatever. I consider it a valuable variety." It is certainly a pretty form, and one well worth growing, but its chief interest, as we have said is botanical. We will allude to some of the principal points. The stem is as thick as a swan-quill, compressed, hollow in the interior. The leaves are sessile, oblong, scattered, and from the axil of each of the uppermost ones proceeds a stalked and coiled raceme (see fig. 19). In fact, instead of, as in the ordinary Forget-me-not, having a single curved cymose inflorescence, with the flowers on one side, there is here a compound inflorescence, consisting of several lateral flower-stalks, each with a coiled raceme, or rather, racemose cyme at the top. The main stalk ends in a mass of flowers, forming a terminal head or ring, in which the parts are so inextricably confused that it is difficult to ascertain either their numbers or their relative relation. In the ground plan the artist has succeeded in giving an intelligible explanation (figs. 20, 21). So far then we seem to have a case of fasciation, together with fusion, or running together of several of the upper flowers into one mass, somewhat similar to the cup-shaped flower so common in some seasons in the Foxglove.

But this compounding and branching of the inflorescence is not so remarkable as the construction of the individual flowers. Each flower, in fact, has

eight, nine, or ten sepals, as many petals, stamens, and ovary-lobes, the styles of which latter are united so as to form a tube through which passes an abortive and rudimentary secondary flower (median proliferation). It would thus appear as if each of the lateral parts of the flower were divided by lateral branching, or "chorisis," so that the number of parts in each floral ring or whorl is increased, while the whorls themselves are not augmented.

In the accompanying figures, fig. 19 shows the extreme tip of one of the branches. In it the "hen-and-chicken" arrangement is well shown, the "hen" being represented by the central or terminal compound flower, from beneath whose sheltering protection emerge the side branches with the "chickens," or lateral flowers, each with their ten segments.

Fig. 20 is an enlarged vertical section through the central flower, G1 indicating the glands or processes which form so conspicuous a feature in the flowers of all the species of *Myosotis* and other Borage Worts.

Fig. 21 shows a ground plan of the same composite flower, and makes it evident that there is an outer ring consisting of several confluent flowers, the ring surrounding five other centres of growth arranged around the central axis. The structure is therefore complicated and curious, the most interesting features being its reproduction from seed, which is now known to have occurred during several

FIG. 20.—"HEN AND CHICKENS" FORGET-ME-NOT, MYOSOTIS VICTORIA, ENLARGED VERTICAL SECTION OF A FLOWER.

Section through the centre of the terminal flower; one of the side branches bearing the "chickens" is shown springing from the axil of a leaf, below the terminal flower.

FIG. 21.—"HEN AND CHICKENS" FORGET-ME-NOT, MYOSOTIS VICTORIA, A GROUND PLAN OF A FLOWER MAGNIFIED, THE BLACK CRESCENTIC LINES REPRESENT PETALS CUT ACROSS.

which the astronomer observed, especially the two last-named, which have poisonous qualities attributed to them. *S. P. Oliver.*

(To be continued.)

MYOSOTIS VICTORIA.

THE "Hen and Chickens" Forget-me-Not, of which we give illustrations, is of special interest just now when the question of the inheritance, or otherwise, of malformations is attracting so much attention among scientists. Its history is also curious.

* This is the flower, white as a Lily, and like a Jessamine, which Professor Balfour supposes to have been some kind of Orchid, which has probably become extinct.

years, and its possible spontaneous origin in a garden at Bexley, as well as in Germany.

The plant would form a most interesting subject for a botanist with time and patience at his disposal to examine the course of development of the flowers *ab initio*, and also the arrangement of the vascular bundles from below upwards. By such an investigation the true explanation of the peculiarities here mentioned might be arrived at.

For those who do not care to pry into secrets, the unravelling of which demands special knowledge as well as patience, we commend the flower for its beauty alone. In a genus containing so many lovely members, we will not venture to say that this is of surpassing merit, but, at any rate, it is beautiful and desirable for variety sake, quite independently of its remarkable structure.

For the specimens whence our notes are taken, we are indebted to Mr. W. Marshall, the Chairman of the Floral Committee, and to Edmund Hyde, Esq. M. T. M.

IRISES.

BEAUTIFUL as many of the Orchids are, they have very close rivals in some of the Irises, for what can be more lovely than the different varieties of these, following on, as they do, in long-continued succession? The first to come into flower in quantity is *I. germanica*, which is very hardy, and will grow almost anywhere; but the situation most suitable for it is an open sunny one, and where they have plenty of root moisture. The way, I think, in which these Irises do best, and are most easily managed, is in masses by themselves, as then the numerous spikes of blooms, of such varied colours, intermingle and make a fine show.

When the growths of the plants become too much crowded, as they soon do, it is an easy matter to pull them up where they are crowded; or lift the whole lot and replant. If this is decided on, the ground should be deeply dug, and be well dressed with rotten manure. Beds or borders that are left as they are should have a rich top-dressing every spring before the plants start into growth, as, like many other perennials, Irises soon get their crowns or rhizomes high above the soil. Following close on the heels of the German kinds come the Spanish, which are very beautiful flowers with rich colours and shades of colour. Unfortunately, these are not so hardy and enduring as *Iris germanica*, but there is no difficulty whatever in growing them, as in ordinary light and dry soils they may safely be left without protection, and in such as are not favourable, they should be taken up and stored during winter, as they are bulbous-rooted, and keep well in sand.

Iris Kämpferi produces gorgeous flowers, but to grow them well they should be so planted that their roots can descend into moisture-holding soil near a pond side, or at the sides of a stream, but in most gardens it is necessary to afford them frequent watering. The way to increase *Iris Kämpferi* is by division, and they also come readily from seed, plants flowering freely at a year old, if raised early in spring. The English Iris are also very showy, and have bulbous roots, of a larger size than those of the Spanish, the plants, too, being of stronger growth, with bigger, longer, and broader leaves than those of the Spanish. They grow freely in any ordinary garden soil, and when once planted are best left very much to themselves. *J. Sheppard*.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM MULUS HOLFORDIANUM.

NOTWITHSTANDING the fact that collectors had been in the cool regions of New Granada and seen the plants thriving under conditions so very different to those they were subjected to at home, nothing appears to have been said by them relative to this matter; this was the great drawback to the establishing of South American Orchids in our collections, and it was not until after the year 1850 that the observations of Warszewicz upon this very subject bore fruit, in an experiment which was carried out in the establishment of the late Messrs. Thomas Jackson & Son, at Kingston in Surrey, who started a cool Orchid house, and many were the doubts and fears expressed for the plants therein through the first winter; but they came through well, and the example set soon became common in the land. It was the first cool house that ever existed in this country, and in it were saved and flowered many of the last discoveries of Warszewicz. * * * In its native home *O. mulus Holfordianum* occupies a wide range, and is found at between 7000 and 9000 feet elevation, so that it is a thoroughly cool plant. It requires to be potted in well-drained receptacles, using for soil, peat that has been well beaten to remove

the earthy parts, and to this may be added some chopped sphagnum moss, the whole to be made very firm and hard. The plant should be elevated a little above the rim of the pot, and during the growing season an abundant supply of water will be necessary, but in the dull winter months less should be given; yet at no time in the year should the plant be dried. Care and attention must be given these plants during the hot summer months, as we have found this species and its near allies to be extremely subject to the attacks of thrips and red-spider—the first, doubtless, encouraged by want of ventilation, and the second through the atmosphere being kept too dry. *Orchid Album*, vol. ix., part 108.

MASDEVALLIA MACRURA

grows naturally at some 6,000 or 7,000 feet elevation, and at this altitude, where Masdevallias exist in great quantities, the atmosphere is much rarefied and the temperature very cool. The usual state under which the Masdevallias of New Granada grow we are told is frequent and heavy rains for nearly the whole year, and dense fogs, with the temperature in the morning about at freezing point. To imitate such conditions under artificial treatment is almost a matter of impossibility, but we have found that these plants thrive best under the very coolest treatment; in the very hottest part of the year the thermometer should not exceed 70°, and even a few degrees lower would be better. To effect this proper care should be given to shading from the sun by keeping the atmosphere well charged with moisture and by giving a proper amount of air. This treatment in a lean-to house with a northern aspect will result in giving plants with clean healthy leaves, and in due season an abundance of flowers. Masdevallias will succeed well with many species of *Odontoglossums*, such as *O. triumphans*, *O. Hallii*, *O. crispum*, &c., but when a large collection is aimed at we would always recommend a separate structure for their maintenance. This plant, being a large and vigorous grower, thrives best in a pot, which should be nearly filled with drainage, and for soil use a little peat fibre and chopped sphagnum moss, pressing it down firmly, but not using a great quantity of mould about its roots. Masdevallias grown under the above conditions will not require so much attention to keep them free from thrips as when subjected to more heat, but care must be continually given to prevent the accumulation of insects upon them. The worst that can be allowed to gain a footing are the red and black thrips, as they leave large black marks upon the under side of the leaves which cannot be eradicated. *Orchid Album*, vol. ix., part 108.

PHAJUS HUMBLIOTI

Is in flower in many varieties in Messrs. Sanders' Orchid establishment at St. Albans, and is an exceedingly useful Orchid for flowering at this season of the year. The plants seem to grow very freely in a house where the temperature was not very high when I saw them—about the last days of July; indeed, it could not be, as the day was cold, with no sunshine, and none of the Orchid-houses were artificially heated. Being an importation from Madagascar, and found growing in the shade of trees, the plants require shade from bright sunshine, and the collector, M. Leon Humblot, after whom this species was named, stated that it was in a moist state at the roots all the year round. It does not form pseudobulbs like some Orchids, and it would, therefore, be a mistake to dry it off. The upright spikes of flowers show well above the broad, deep green leaves; the sepals and petals are of various shades of rosy-purple, and the spikes seem to be just the thing for the centre of medium-sized vases of cut flowers. *J. D.*

CATASETUM CALLOSUM.

Dr. Lindley figures and describes in the *Botanical Register*, 1841, t. 5, five very singular looking species of *Catasetum*, and amongst them *C. callosum*. A few years later *C. callosum grandiflorum* is also figured in the *Botanical Magazine*, t. 4219. Sir Wm. Hooker likens the flowers of this plant "to the body and legs of a great spider."

This plant is now in flower in Messrs. Sanders' nursery at St. Albans. I thought it was one of the most singular-looking Orchids I ever saw; the sepals and petals are of a dull reddish-purple; the pointed lip, dark green at the base, is terminated with a reddish-purple blotch, the green part being furnished with crimson spots. The form of the flowers is extremely curious. Another form of it is figured in the *Botanical Magazine*, t. 6648, with brown sepals and petals, and the lip differing slightly by being of an uniform green colour, and speckled with red. Associated with it was *C. Bungeorothi*, which produces male and female blossoms on the same plant. *Cynoches chlorochilum* also formed an interesting feature in this small group of plants. All were growing in baskets of teak, suspended from the roof. The large yellowish flowers of this last-named species are very striking. This class of Orchids should not be altogether neglected for more showy, but nothing like such interesting, plants. *J. D.*

AERIDES LAWRENCEE.

This is the most handsome *Aerides* yet introduced to our gardens, and like many fine things in the Orchid family we owe its introduction to the enterprise of Messrs. Sander & Co., St. Albans, in 1883; and there is now in flower in their nursery a dozen beautiful varieties of this and *A. Sanderianum*, a very nearly allied form. The sepals and petals are creamy white, pure white or pale yellow, distinctly blotched at the tips with amethyst-purple. The lip is prolonged into a quaint horn-like spur, and the very large flowers, rather closely set on long pendulous spikes, have a grand effect at this season of the year when Orchid flowers of any kind are so scarce. I counted twenty-eight flowers on the longest spike, but many more have been produced on one. The plant is first noticed in the *Gardeners' Chronicle* for 1883, vol. xx., p. 369. The plant, described "as the best and most beautiful *Aerides* ever introduced," was sold for 235 guineas at Stevens' sale rooms. It is from the Philippine Islands, is not of difficult cultivation, and being now moderate in price, it should be found in every collection of Orchids. *J. D.*

FORESTRY.

LARCH CANKER.

Mr. J. B. CARRUTHERS has a useful article on this subject in the last part of the *Journal of the Royal Agricultural Society*. The real cause of the disease was not detected till 1859, when the late Sir Walter Trevelyan called attention in the *Gardeners' Chronicle* to his discovery of a small fungus associated with the disease. This was submitted to Mr. Berkeley, who wrote on the subject in our columns on Dec. 17, 1859. The subsequent observations of Wilkomm, Hartig, Saccardo, and Marshall Ward, are summarised by Mr. Carruthers. The fungus was originally called a *Peziza*, but is now referred to *Dasycephala*, under the name of *D. calycina* var. *Trevelyanii*, *D. calycina* proper being found on the Scotch Pine. The large fungus attacks only the living tissues, while the form that is found on *Pinus sylvestris* grows on the dead branches.

Professor Marshall Ward is of opinion that the fungus cannot penetrate the sound bark, but infests it only through some wound or injury, such as may be occasioned by late frosts; but Mr. Carruthers finds that the spores germinate also on the uninjured bark. Minute white cup-shaped fungi like cluster-cups, orange inside, form the only part of the fungus visible to the naked eye, the spawn permeating the living bark and the young wood under it in all directions, and availing itself of the nutritive juices which the plant prepares for its own use. The disease is purely a local one, there being no connection between the disease and the roots of the tree. Each fresh canker is caused by a new and independent attack, and is entirely due to the germination of the spores of the fungus on the bark, "and is not in any way the result of the physical causes

which have been credited with it, such as confinement, excess of moisture, cold or wet seasons, spring frosts, except so far as these have favoured the growth of the spore by providing the moisture necessary for its germination. The only remedy possible is to examine the young trees carefully, and at once to burn all those found to be affected. Even if the white cups be not present, the dark and flattened condition of the bark indicates the presence of the fungus, and should there be any doubt, the slightest cut with the knife will show the very dark colour of the injured bark. This injured

TREES AND SHRUBS.

STAPHYLEA COLCHICA.

Few plants can be forced better than the above, yet it is only here and there that it seems to be valued to any great extent, and grown in large quantities; perhaps it is that the difficulty of propagation blocks the way, or the price of the plant that is the cause of this. However, plants suitable for forcing may be obtained at a small cost; and as to the difficulty of increasing the stock, that is very

They are also increased by layers, which is a good method to follow; and if seeds are sown soon after they are gathered, which should always be in well-drained pots, and stood in a frame or pit in a temperature of 55°, some of the seeds will germinate in a short time, while others may not come up for eighteen months. When they have grown half an inch high they may safely be pricked out in pans, or round the rim of 6-inch pots, and put into a cold frame till they are of a size suitable for planting out on borders, and on no account whatever neglected in the matter of watering. The principal points to be

FIG. 22.—STAPHYLEA COLCHICA: FLOWERS WHITE.

portion may be cut out and burnt. Mr. Carruthers concludes by asking whether it would not be better to replace the Larch by other trees suitable to our climate. From this point of view we would point out the claims of *Thuia gigantea*, *Thuiopsis borealis*, Lawson's Cypress, *Abies brachyphylla*, *Picea pungens*, *Sequoia sempervirens*, as each and all promising subjects, though no doubt when cultivated on a large scale, they too will sooner or later be attacked by some pest or other. We congratulate Mr. J. B. Carruthers on his very useful essay, and trust we may have more from his pen on the very important subject of plant diseases.

easily surmounted, if the following directions are carried out. If shoots that have been thoroughly exposed to the sun be taken off in July or August, and cut to 4 inches in length, using a sharp knife so as to make a clean cut below a joint, placed in light soil composed of peat and loam in equal proportions, with a good sprinkling of silver-sand and one-third good cocoa-nut fibre, the pots plunged up to their rims in a close case in a temperature of 60°, giving the cuttings a good watering with a fine-rose water-can, and an occasional watering overhead, shading them from direct sun's rays until they have formed roots, they will root readily.

kept in view with plants that are intended to flower before their usual time is to have the wood in a matured condition, as insufficiently ripened wood cannot be depended on to bloom well.

Plants for forcing can be taken out of their quarters and potted any time after the leaves have fallen, keeping them in a greenhouse before putting them into heat. They should not be subjected to a high temperature at first, but brought along gradually, and when the flowers are about to open, flowering will be prolonged if they be placed in a cooler house to expand. When the bloom is past, all necessary pruning may be performed, and the plants placed in

gentle heat, giving plenty of water, and using the syringe freely, and when a fair amount of growth has been made they should be hardened off, and planted out, or the pots plunged in a sunny aspect, and freely supplied with water, and during the growing period with liquid manure afforded occasionally.

Staphylea colchica (fig. 22) makes an admirable shrubby plant, being hardy, and once planted in good soil, and full sunlight, with a clear drainage, it will continue to bloom year after year. Out-of-doors the flowers are white, and the unexpanded flower buds delicate pink, but this disappears when the plants are grown under glass. There is a hybrid known under the name of *S. c. Coulombieri* ×, whose flowers are borne in drooping panicles of thirty to forty flowers each, of a larger size than those of *S. colchica*, nearly pure white, and the yellow anthers just peeping above the tips of the wavy petals. I have not seen it forced into bloom early, but in all probability it will come to the front as a forcer, as it opens its flowers unforced seven to ten days before those of *S. colchica*. It is being grown in rather large numbers by continental nurserymen, but I am not aware of its being found in any English gardens. Like *colchica*, it is hardy, and has endured the rigours of the past winter without being in any way injured. *H.*

THE SPANISH BROOM (*Spartium junceum*).

The bright yellow tall shrub, with rush-like branches, that at the present time is brightening many a crowded shrubbery, is the old Rush Broom which has been in English gardens for over three centuries and a half. It is common enough, but how seldom is its value as one of the few late summer flowering shrubs made the most of! It is generally planted at random in the mixed shrubbery, where it manages to thrust its head above the surrounding crowd; but to give full effect to it, one must have it as an isolated mass on a lawn, accompanied by some other shrub that groups well with it, and that flowers at the same time. The other day I saw a fine group of it rising out of a mass of *Philadelphus speciosus*, one of the best of the Mock Oranges, and being both in flower, I thought I had rarely seen a more showy shrub group on a lawn at the end of July. It is a plentiful and cheap plant in nurseries.

CISTUS LADRIFFOLIUS.

Among the rock Roses that escaped the severity of the past winter, is this species, which is perhaps the most beautiful of the many in cultivation, and one that no one need hesitate to plant in any garden where the soil is not heavy and cold, and the situation too bleak. Nothing among hardy flowers can exceed the beauty of this *Cistus* when crowded with flowers, as it has been every sunny day for the past month. The flowers of the original form are pure white, of satiny lustre, and 3 inches across; but this variety is not so striking as *maculatus*, which has, at the base of each petal, a broad blotch of purple crimson, which, with the tuft of yellow stamens, make an exquisite harmony of colour with the deep green of the foliage. It is a broad spreading bush naturally, and soon reaches its full height of about 5 or 6 feet, and spreads as much across. As it resents being crowded in a shrubbery, it should be planted by itself in the full sun, and if the soil be very heavy, it should be made lighter, or planted on a raised bed or bank. For hanging over a bold cliff of rock, provided it has plenty of soil to grow in, there is not a finer shrub. This *Cistus*, and *C. ladaniferus*, are the only two that are grown in nurseries where every tender shrub is excluded.

CYTISUS NIGRICANS.

A pretty shrub that does not seem to be known much in nurseries, is the dwarf Broom that has been in flower for the past fortnight in the Kew arboretum. It is a deciduous shrub, growing to a height of about 3 feet, and forming, in an open spot, a neat compact bush, which at flowering time is crowded with numerous erect racemes of clear yellow pea-shaped flowers, which are afterwards succeeded by numerous seed pods, so that the shrub is readily

propagated. I have sometimes seen it grafted standard high on the Laburnum, and then its elegant slender shoots, terminated by flower spikes, have a very pretty effect. It is a native of northerly Italy and adjacent regions, and was introduced 150 years ago, yet now it is not common. *W. G.*

KEW NOTE.

LILIUM GRAYI.—This charming little Lily, named in honour of Dr. Asa Gray, is now flowering in the Royal Gardens, and so far as we know for the first time in Europe. The stems are about 3 feet in height, bearing four to eight lanceolate leaves in whorls. The flowers solitary, and drooping, but often three or more on wild specimens, segments slightly spreading, but not recurved as in its near ally *L. canadense*. Flowers $1\frac{1}{2}$ —2 inches long, broader in proportion to the length than in *L. canadense*, deep reddish-orange colour, covered throughout with deep purple spots. The roots are very similar to those of *L. canadense* and *L. superbum*. This pretty species will no doubt improve under cultivation, and with several instead of one flower to a stem, it will certainly be an acquisition. There is nothing in cultivation quite like it, its bright colouring and dainty drooping flowers bespeak its future popularity. *D.*

REPORTS ON THE POTATO CROP, UP TO THE END OF JULY. SCOTLAND.

ABERDEEN.—Potato crops look well, but are very late; earliest sorts are a good crop and of good quality; all as yet perfectly healthy. *John Forrest, Haddo House, Aberdeen.*

AYRESHIRE.—Potatoes look well and healthy, but early sorts are small owing to the want of rain. The quality, however, is first-rate, no sign of disease as yet. *W. Priest, Eglington Gardens, Irvine.*

EAST LoTHIAN.—Kidney Potatoes are smaller than usual, but the quality is very fine, and free from disease. The heavy rains of the last fortnight have greatly improved the field varieties. *James Morrison, Archerfield, Drem.*

— Early Potatoes are very small, but a good crop, owing to not having any rain to speak of for several months. The much needed rain came yesterday, and, no doubt, will improve the late varieties. Field Potatoes are looking very well. *L. Dow, Newbyth, Prestonkirk, N.B.*

— Early crops suffering much from drought; quality good. Late sorts and field crops are looking remarkably well. Escaped spring frosts in this district. *R. P. Brotherston, Tynninghame, Prestonkirk.*

FORFAR.—The Potato crop, which is here an important one, promises to be a good one. Early garden Potatoes, though injured by frost, are excellent. In low-lying places the main crops were frosted on June 9, but they have recovered remarkably well; the sunny weather has forwarded the crop, and no sign of disease either in gardens or fields. *Jas. Whitton, Glamis Castle Gardens.*

BANFF.—Potatoes, both in the gardens and fields, are looking strong and healthy (with the exception of *Magnums* and *The Bruce*, which have both come up irregularly), and should yield an abundant crop. The early varieties are a fortnight later than usual, and are still soft and watery, but improving daily. *C. Webster, Gordon Castle, Fochabers.*

MIDLoTHIAN.—Potatoes were slow at starting. Early kinds were about a week behind the average in being fit for use, and were at first rather poor in quality. They have improved very much, and are now first-rate in quality and quantity. No disease has yet appeared and the tops are strong and very healthy. *Malcolm Dunn, The Palace Gardens, Dalkeith.*

RENFREW.—The Potato crops are looking excellent, I never saw them better. The harvest prospects are a good deal brighter than last year. *Henry Maxwell, Ralston, Paisley.*

RENFREW.—Early Potatoes, Veitch's Ashleaf, are an abundant crop, and excellent quality, but rather small owing to dry weather. Late varieties are looking exceedingly well. *Thomas Lunt, Ardgowan Gardens, Greenock.*

— The Potato crops everywhere in this district are most promising; the dry season has suited them; Kidneys and Smith's Early turning up well, and no signs of disease. *John Methven, Blythswood, Renfrew.*

ENGLAND.—NORTHERN COUNTIES.

NORTHUMBERLAND.—The Potato crops look well. We have had a dry season, with an exceptionally late spring. Potatoes and fruits are all late. I have examined some large fields of Potatoes, where about eighteen loads of farmyard manure, with nitrate of potash and phosphates were added, and the crop looks splendid. *George Harris, The Castle Gardens, Alnwick.*

— Early kinds are good in quality but not so large as usual, owing to the severe frosts in May, which cut them to the ground. No disease as yet. Our best garden sorts are Old Ashleaf, Duke of Albany, Cole's Favourite, Rivers' Early Ashleaf, and Sutton's Ringleader. In the field they are looking remarkably well. We are trying for the first time a few of Mr. Findlay's (of Markinch, Fifeshire) Hybrids, viz., *The Bruce*, *Lady Francis*, *Astonishment*, *Thane of Fife*, *Her Majesty*, and *Jeannie Deans*, which are all practically disease-resisting. *Thane of Fife* is a very fine sort, a good eater, and present appearances indicate for it a popular future here. Experiments have been tried in Belgium and France in 1889 and 1890, with sulphate of iron and sulphate of copper to prevent the disease. We are at present trying the same remedy, and will be glad to let you know the result. [Pray do so. Ed.] *David Inglis, Howick Hall, Lesbury.*

WESTMORELAND.—Early Potatoes were cut down on May 17; ours were not above ground on that date, but were touched by the severe frost. Cottagers err in planting too shallow, and having sets sprouted too much. Late crops are looking well; *The Bruce* looks particularly promising. *W. A. Miller, Underley, Kirkby Lonsdale.*

DURHAM.—Potatoes were all cut down to the ground on May 17 and 18; second growth is weak, and the tubers are small. What with the early frosts and dry weather, early Potatoes will be very much under the average. *R. Draper, Seaham Hall, Durham.*

YORKSHIRE.—All early Potatoes were cut down within the ground by the sharp frost on the nights of May 17 and 18, when we had 13° of frost. Late kinds, *Magnum Bonum*, *Imperators*, and *Regents*, are looking healthy and well. So far no symptom of disease has yet shown itself anywhere in this district. *Robert C. Kingston, Brantinghamthorpe, E. York.*

EASTERN COUNTIES.

LINCOLNSHIRE.—Potatoes are very late. Most early varieties were cut down after they were 6 or 7 inches high by a sharp frost on May 17, and the ground was covered with 6 inches of snow. The early kinds are as yet small but clean. Late varieties look promising. *John Rowlands, Bardney Manor Gardens, Lincoln.*

SUFFOLK.—Could not look nor promise better. Never laid so long dormant in the ground. Many earlies severely cut back through late frosts, but midseason and late crops have had no check, and one can almost see and hear them grow. No sign or sound of disease. *D. T. Fish, Hardwicke, Bury St. Edmund's.*

— As yet I have not seen or heard of a trace of disease, and late Potatoes around us are looking as well as can be desired, the haulm being ample and yet not too strong, and the colour a healthy green. If disease does put in an appearance at its usual time, which is usually about now, the middle of July, its effects will be more severe than ever; the tops are more succulent and less mature. The earlier kinds have been a very poor crop, having been cut by frost, and those that escaped have suffered from cold, the effects of which showed itself in the curled crippled

foliage. The second earlies are first-rate, the sorts we grow being *Huntingdon Kidney*, *Beauty of Hebron*, and *Snowdrop*, the first-named being unapproached for high quality. We are digging from the kind now, as it follows closely on *Myatt's*, but beats *Myatt's* in every respect, as it is a much heavier cropper, and produces handsomer tubers, which are dry and mealy and beat all for flavour. Although an old variety, it does not appear to be much known, but so valued is it here, that I would rather be without any other kind. If the disease does come, all early sorts should be at once lifted, as it is useless leaving them in the ground after, and though the skins may not be quite set, that will matter but little if care is exercised in the handling. Before moving them about, or storing, I always like to let them lie on the surface of the soil for a day or two, but not long enough to get green and hard, or to have much exposure if the sun is very fierce and hot, as they are then better in some dry airy shed, where they should be laid thin, but not covered in any way. *J. Sheppard, Woolverstone Park, Ipswich.*

ESSEX.—Haulms of early Potatoes destroyed by severe hailstorm, followed by 9° of frost; early sorts, therefore, have been later than usual, and the size of tubers has been very small. Late sorts are looking remarkably well. I have not seen any disease as yet. The field crops look capital. *Arthur Ocock, Havering Park, Romford.*

— The Potato crop looks admirable. In gardens the haulm is commencing to ripen upon *Kidney* and early-set *Beauty of Hebrons*, the yield of the latter being already very good. Though I anticipate disease in connection with such forward crops and the frequent thunder rains, I failed to detect the least symptom to-day. The hundreds of acres field-grown, though late, could not look better. *William Earley, Double House, Ilford.*

— Potatoes look remarkably well at present; no signs of disease. Owing to the late season, tubers are rather small, but improve every day since our last rain, *Veitch's Improved Ashleaf* being our best early kind. *James Vert, Audley End Garden, Saffron Walden.*

NOTTS.—The Potatoes are looking well in this district, but late; no disease as yet. A week's bright and warm weather would be of great benefit to them. *A. Henderson, Thoresby, Ollerton.*

MIDLAND COUNTIES.

BUCKS.—All perfectly free from disease at present. *Sharpe's Victor* has proved our best early this season; it is very dwarf, and a free-bearing variety. I intend growing it in frames next season, as it can be grown in much less space than any of the American sorts. *Clark's Main Crop* is one of our best, being of excellent quality on our strong soil. *J. Smith, Mentmore, Leighton Buzzard.*

— Potato crops never looked better. Our main croppers are *Roses*, *Hebrons*, *Magnums*, *Victorias*, and, for the first time, I am giving *Clark's Main Crop* a good trial, and so far I am pleased with it. *Giles Bloxham, Brickhill Manor, Bletchley.*

— Potatoes up to the present time look healthy and well, and no disease yet seen either in tuber or haulm. The crops generally are very late and rather small, but with fine weather and freedom from disease promise to be good. *Chas. Herrin, Droghda, Maidenhead.*

HENTS.—We are now lifting *Ash* and *Walout-leaved* and *Sharpe's Victor* for use; very good turnout, and the flavour good; all other varieties look very promising. If anything, the haulm a little too strong, and with fine dry weather the yield must be good. No sign of disease. *James Charles Mundell, Moor Park Gardens, Rickmansworth.*

WESTERN COUNTIES.

GLOUCESTER.—Early varieties, such as *Ashleaf*, *Challenger*, *Covent Garden*, and *Perfection*, were completely cut down by the frost of May 17, but have since grown well, and we are digging a number of small tubers, but these are well flavoured. Late

Potatoes escaped the frost and are looking well. Should we escape the disease, there is every prospect of its being a good season. *Scotch Champion*, *Magnum Bonum*, and *Sutton's Abundance* are the three principal varieties we grow, the latter being an abundant crop and eats well when kept. *Arthur Chapman, Weston Birt, Tetbury, Gloucester.*

MONMOUTH.—Early Potatoes were cut to the ground by frosts, and the haulm since formed is weak. The tubers are consequently small and not very numerous. Late varieties not affected by frost look promising; the haulm is vigorous. The new kinds, *The Gentleman*, *The Amateur*, and *The Cottager*, are in robust health. Field crops also look well, *Magnum Bonum* particularly so. *Thomas Coomber, The Hendre Gardens, Monmouth.*

WORCESTERSHIRE.—Crops look flourishing; rather much haulm, and if thundery, moist weather should intervene, disease may be expected to follow such succulent growth. The *Early Ashleaf* section is turning out clean, and of good quality, whilst *Sharpe's Victor* is a first early which every one should grow; *Magnum* and *Chancellor* are satisfactory, and the same may be said of the mid-season kinds, such as *Sutton's Seedling*, *London Hero*, *Vicar of Laleham*, &c. *W. Crump, Madresfield Court, Malvern.*

— The crop is looking wonderfully well, without the slightest trace of disease. The early *Kidneys* are rather smaller than usual, the ground being so very dry; second earlies promise a heavy yield; also that grand variety, *Sutton's Abundance*. *Walter Child, Crooms Court, Severn Stoke.*

SALOP.—Earlies decidedly under average, the frost and snow on the 17th May cut them down completely. Late varieties in places look rather spindly. *James Loudon, The Quinta, Chirk.*

CHESHIRE.—Potato crops in this district are looking extremely well, early varieties are flooding the markets, and prices are very low. Late kinds are very robust. No disease up to the present time. *Jno. V. Smith, Arley Hall Gardens, Northwich.*

— Early Potatoes have gone very much to top growth and very little to the formation of tubers. The plants look healthy and are flowering plentifully, so that with a continuance of warm sunshine for a little time good crops may be expected. They are, however, about a fortnight later than usual. *Wm. Whitaker, Crewe Hall, Crewe.*

— Potatoes of all kinds are looking well. Early ones are turning out both good and prolific crops, though our season is about a fortnight later. Early varieties—*Myatt's*, *Sharpe's Victor*; late sorts—*Priestaker*, *Magnum Bonum*, and *Sutton's Main Crop*. *James Dalry, Rode Hall Gardens, Scholar Green.*

SOUTHERN COUNTIES.

KENT.—Early Potatoes thrown back with frost at *Whitsuntide*, but turning out well, and fine quality; main crops look splendid, and no appearance of blight as yet. Every promise of heavy crops, though slightly later. *Wm. Craik, Hothfield Gardens, Ashford, Kent.*

— The blight was found in a garden near here on the 15th, and on the 22nd in the garden here. No tubers bad at present, the variety being *Beauty of Hebron*. Several other kinds are adjoining, and on other parts of the garden, but are free from disease up to present date (July 27). All kinds look very promising, but are making more haulm than usual this season; early kinds are giving a full crop. *W. Divers, Wierton House Gardens, near Maidstone.*

MIDDLESEX.—The late kinds look well and the rains have improved them, as on our light soils it was much wanted. Early kinds have been later than usual, having been cut down by frost when in full growth. We have had good crops of *Veitch's Perfection* on sheltered border. *Myatt's Ashleaf* are now turning in well, and all are free of disease. *Covent Garden Perfection* also promises a heavy crop and are good. *G. Wythes, Syon House, Brentford.*

SUSSEX.—Potatoes on south border, protected with *Fera*, good crop in the open, cut to the ground by frost in May, have grown well since; in the neighbourhood generally they look very promising. *Fredk. Geeson, Cowdray Park, Midhurst.*

SURREY.—The crops of the Potatoes are most promising. I am lifting for present consumption some good specimens. All late varieties, both in gardens and fields, look splendid. If we escape heavy thunderstorms and continual rains, the crop of 1891 will be an exceptional one. The following varieties hold their own, although I have many others:—*Veitch's Ashleaf*, *Sharpe's Victor*, *Puritan*, *Beauty of Hebron*, *Magnum Bonum*, *Prince Arthur*, *Yorkshire Hero*, *Schoolmaster*, M.P., and *Vicar of Laleham*. *A. Evans, Lythe Hill, Haslemere.*

HANTS.—Potatoes were cut down to the ground on May 17. It then was 6 inches high or more in some places. The consequence is a late crop of small tubers. *Sutton's Ringleader* promises well as an early variety. Crops well and of good flavour. *Puritan* has done well this year as an early variety. *E. Molyneux, Swanmore Park Gardens, Bishop's Waltham.*

— The Potato crop in this district is looking remarkably well; the stalks are looking green and healthy, as they were a month ago. There is not the least appearance of disease yet, and those that have been dug are very fair sized tubers. *G. Rea, Heron Court.*

WILTS.—Consequent upon the haulms having been cut down to the ground by the June frosts, the tubers of early varieties which are being dug in the open are smaller, and perhaps more plentiful in the ground than would otherwise have been the case, and the quality is fairly good for tubers which have not completed their growth. All crops, early and late, look well in the haulm. The late varieties, having been planted earlier hereabouts than usual, are all the more promising on that account, and should fine, warm weather prevail during the next few weeks, to enable the plants to complete their growth, there is every prospect of the Potato crop for 1891 being a good and plentiful one. *H. W. Ward, Longford Castle, Salisbury.*

SOUTH-WESTERN COUNTIES.

DEVON.—Potatoes of all kinds are looking wonderfully well; *Veitch's Ashleaf*, *Myatt's*, and *Early Puritan* are in use. I never saw them turn out better, and no appearance of disease. All late sorts are looking healthy. *Geo. Baker, Membland, Plymouth.*

CORNWALL.—The Potato crop is generally good, and the quality of the early sorts excellent. The field crops look very promising. I have seen no signs of disease yet. *James Murton, Pencalernick.*

— Early Potatoes were very much injured by the frost of May 17, for this neighbourhood—in fact it is more than twenty years ago since I saw them cut so badly; the early *Kidneys* on the south borders did not escape, and those on the quarters were so frosted that they had to make a new break. I calculate that they were thrown back nearly three weeks. But thanks to the fortnight's hot weather in June, they improved rapidly, and though tubers are smaller than usual they are numerous and of good quality. The field Potatoes did not entirely escape the frost, but being later they were not checked so badly, and are now looking extremely well, so green and healthy, not a spot of disease either in garden or field. *C. Lee, Bocomnoc, Lostwithiel.*

WALES.

GLAMORGANSHIRE.—Early varieties in this district are turning out heavy crops, and the quality is all that can be desired. We commenced lifting here on June 6 (variety, *Sharpe's Victor*), which with me comes in a few days earlier than the *Ashleaf*. Second early varieties, which escaped the late frosts in May, are producing heavy crops. Late kinds, such as *Abundance*, *Magnum Bonum*, *Champions*, and *Regents*, are looking remarkably strong and healthy, and with favourable weather from now onward the Potato crop of 1891 should be a very productive one.

No signs of disease up to this date. *R. Milner, Penrice Castle, Swansea.*

CHANNEL ISLANDS.

JERSEY.—The Potato trade has greatly increased this year. The crops have been abundant and the tubers large. More than 6000 van loads, averaging a ton each, have passed over the weighbridge for exportation during the week ending on the 11th ult., which number had been exceeded in previous weeks. It is generally supposed that the year's traffic in Potatoes will return upwards of £400 000 to the Jersey farmers. The sorts mostly grown are Myatt's Prolific and Webb's Imperial Kidneys, the latter under the name of Royal Jersey Flukes, their fine appearance and size commanding the highest prices. Careful sprouting and late planting in highly manured soils have solved the problem of Potato culture most satisfactorily. *Chas. B. Saunders, St. Saviour's, Jersey.*

PLANT NOTES.

ERYNGIUM OLIVIERIANUM.

WHEN a wrong name gets established in gardens it is a very difficult task getting rid of it, as is amply proved in the case of the above *Eryngium*. This plant is found in gardens almost everywhere under the name of *E. amethystinum*, and the striking steel-blue flower heads answer so well to the name that growers are very reluctant to change it for its proper one of *E. Olivierianum*. In *E. amethystinum* the flower heads are much the same colour, but smaller and not so striking as in the above. The habit of the plant is always decumbent, never upright as in *E. Olivierianum*, the stems rarely exceeding a foot or eighteen inches in length. The leaves always deeply triplicate, and never entire as they often are in *E. Olivierianum*. They are both well worth having, and both worth their proper names; the latter especially is one of the most striking plants on the Rockery at the present time, the stems as well as the involucre bracts being of a brilliant steel-blue colour and very attractive. *E. alpinum* seems to be flowering well everywhere this year, and is certainly by far the showiest of this showy genus. *D.*

FUCHSIA TRIPHYLLA.

The above is a very beautiful plant, which I saw in flower the other day in the nurseries of Messrs. J. Laing & Sons, Forest Hill, and which is also nicely in flower at Kew. The points of all the young growths are well furnished with clusters of bright orange-scarlet flowers, which differ from the ordinary forms of the garden *Fuchsia* in being erect. It is also very interesting, as being the plant upon which the genus was founded in 1703 by Plumier, who had previously collected it in the Island of St. Domingo; 180 years later it was again found in St. Domingo by a Mr. Thomas Hogg, and sent to England in a living state. Mr. Hogg says that in its native country it forms a round bush, 18 inches high, every shoot of which is terminated by a raceme of orange-scarlet wax-like flowers. In the hands of Mr. J. Laing this interesting species may become the parent of a new race of hybrid *Fuchsias*.

Associated with it was a group of plants of a singularly neat and pretty variety of the garden *Fuchsia*, with blush-coloured flowers, named Countess of Aberdeen. In colour, form, and habit, this is quite out of the range of the ordinary varieties, and although not a new plant by any means, it should be better known than it is. *J. D.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

THE COOL HOUSE.—*Oncidium Marshallianum* in this house will now be making growth which will be in a great measure, so far as blooming plants are

concerned, large or small according to the size of the spikes and the length of time the flowers were allowed to remain where the plant last flowered. *O. Marshallianum* has never been considered one of the easiest plants to grow year after year, the fault I believe of leaving the flower-spikes upon the plants for too long a time, and in some cases by reason of growing the plants in too warm a house. When the plant is grown in the cold house some difficulty may be found in keeping down thrips, the growth being very succulent, but I have always found that old established plants are more liable to their attacks than recently imported ones; and the syringing of the plants morning and afternoon should not be neglected, as it is very conducive to the health and growth of the plant.

Oncidium tigrinum is another grand plant of the cool house which has become rather neglected of late years. Notwithstanding it is a plant of very easy culture, I find that it suits the plant to pot it in a mixture of peat and sphagnum moss, and during the growing season afford it a liberal supply of soft water, and when the bulb shows signs of swelling some manure water may be made use of. It is a gross feeder, and with guano water the bulbs may be made to grow to a large size. When the pseudo bulbs are of full size water should be withheld to allow them to ripen, as on the thoroughness of this depend the size of spike and the quantity of flowers produced. I rarely give water more than twice at the most in the interval between the months of November and March.

Oncidium macranthum is one of the most admired plants of the genus, and it is one that may be grown in the coolest house, as near to a ventilator or door as possible, the door or ventilator being thrown open at all times when the temperature outside reaches 45°. Under the same kind of treatment *Odontoglossum ramosissimum* thrives perfectly. This, also, is a very pretty flower when seen with good spikes of flower, though it cannot compare with many other *Oncids*. *Odontoglossum blandum* is still considered by many orchidists to be the best of its section; but for years its requirements have been too little understood, and the plant in consequence has got to be looked upon as milky. Some years since it was generally considered that this plant required the warmth of an intermediate house to grow it well; fortunately such has proved to be incorrect, the plant delighting in a cool, moist position in the cold house. *O. navium majus*, a plant which is very closely allied to the latter species, requires cool-house treatment.

Odontoglossum coronarium, a very capricious plant, is now throwing up its flower-spikes; and almost equally uncertain as to its time of flowering is *O. Chirguense*; both may be well, as far as growth goes, when they are grown in boat-shaped baskets; but the blooming of the plants is, it seems to me, more a matter of luck than anything else. The drying-off of these plants as an inducement to form flowers is wrong practice, I am convinced. *Oncidium incurvum* has now got its flower-spikes well advanced, and if the spikes are fastened to sticks or a trellis, no time must be lost in getting it done as fast as the spikes come to maturity, as they become very brittle, and are liable to snap off hours after the plant has been dealt with. *A. G. Catt, Parkfield, Hallow.*

THE APIARY.

CONTRACTING SUPERS.—As the honey season is all but over, excepting in heather districts, surplus chambers should now be reduced to one section crate per hive, into which the unfinished sections should be placed, in the hope of getting most of them completed before the honey-flow quite ceases.

FEEDING UP.—This will be the next operation to demand attention, and it is important to obtain pure Cane-sugar for the purpose. This not only has a greater sweetening power than the inferior article, being therefore more economical in that way, but it contains nothing harmful to the bees in the shape of potash, salts, &c. Suitable feeders should now be obtained in view of their being soon required, and of all the rapid feeders the writer has tried, he has found nothing equal to one made by Mr. Stothard. It holds 20 lb. of syrup, so that the right quantity can be given to each stock in one dose. The feeding-trough is at one end, and a large number of bees can feed at a time. To place it on the hive, turn back about 2 inches of the quilt at the ends of the frames over which the trough goes, thus admitting to it bees from every one. It will be emptied in probably less than twenty-four hours, and can then be shifted to other hives in succession. The writer much

prefers it to the Canadian feeder, as the quilt being between it and the frames it is not propolised, and can be taken away with less disturbance to the bees; it is also a cheaper article, and easier to make at home. A sheet of glass covers the top, so that it can be seen at a glance when it is empty.

COTTAGERS' CONDEMNED BEES.—Arrangements should now be made with cottagers and others, who are in the habit of sulphuring their bees, to take the honey for them by the improved methods of driving or bumping, and many a lesson can be imparted in this way, besides rescuing the bees from an untimely fate. The bees may be either used to strengthen existing colonies, or be made into new stocks by placing, say, the contents of two skeps on worked-out combs, and rapidly feeding with 20 lb. of syrup, or the bees from three or more skeps can be made to draw out combs for themselves by placing them on foundation. It is also a good opportunity to secure young queens, which are always to be found in hives that have swarmed during the current season and in casts. The only risk incurred is the danger of incurring foul brood, which should be watched for very carefully. It can be identified by the disagreeable smell emanating from the hives affected, and if, upon examination, the brood in the cells is found to be putrid, and many of the cappings are pierced with small holes, there can be no doubt as to the cause. *Expert.*

PLANTS UNDER GLASS.

POT ROSES.—Roses which were struck from cuttings last spring and have now filled their pots with roots, may be shifted into other pots, say 32's, which will be found quite large enough for them. There should be no delay in getting this work out of hand, or there will not be sufficient time for the plants to take possession of the fresh material before the growing season comes to an end. A suitable compost for them will be found in good loam, rotten manure and sand, well mixed together. The materials should not be too moist, and the potting should be the reverse of loose. Cuttings of the Tea varieties of the Rose may now be put in, and it is very generally admitted that Tea Roses struck from cuttings make the best plants for pot culture. Care should be taken to choose shoots for making cuttings which are in a half ripened condition about the base, as if too soft they are very apt to damp off in the cutting bed. Secure a heel of the previous year's growth with the shoot, cut them to 5-6 inches long, and place 4 or 5 cuttings round the rim of a 48-sized pot filled with sand; water them with a fine rose, and when dry stand the pot in a cold frame for a few weeks on a bed of fine coal ashes, keep the lights closed and shade the cuttings when the sun is bright, as the leaves must not be allowed to flag. When the cuttings are callused remove them to a gentle hot-bed, when few will be found to fail.

CELOSIA PYRAMIDALIS.—By sowing a little seed at the present time, and growing the seedlings quickly, useful plants for autumn decoration of the greenhouse may be obtained. Grow the plants where they will get sufficient light, but not in too high a temperature, the latter causing weakly growth. Pots of moderate size—say, 48's or 32's—will be large enough for the succession. When the pots become filled with roots, weak manure-water may be liberally afforded until the plants commence to flower.

IMPATIENS JERDONIAE.—This species is a very delicate subject to deal with during the wintry months, the fleshy stems being very liable to decay if the plant gets much water, or is placed in a low temperature, and especially those examples which have flowered during the preceding summer. It is advisable, therefore, to put in a few cuttings of the plant at the present time, choosing the small young shoots, which are produced freely on the strong branches, and taking them off at the base and inserting three cuttings round the sides of small pots filled with sandy soil, standing the cuttings on a shelf near the glass to root, and always shading them in bright weather. Be cautious about giving more water than will just keep them from shrivelling. When the cuttings are well rooted, repot the potful without disturbing them. The flowering pots should not be more than two sizes larger than the cutting pots. Two parts fibrous peat, one of chopped sphagnum, and one of sand will be found a suitable compost for *Impatiens Jerdoniae*. Grow the plants where they will get abundant light, and plunge the pots in baskets filled with moss, suspending them from the roof of the house, where they will bloom

freely, and the brilliant-coloured flowers be seen to the best advantage. During the winter months keep the plants comparatively dry, and in a temperature of from 55° to 60°. *R. Milner, Penrice Castle, Swansea.*

FRUITS UNDER GLASS.

VINES IN POTS.—We have just got our pot-Vines into disused Strawberry-pits, the pots being let down on to the ground, and the Vines laid on the Strawberry-shelves. In this position they will get thoroughly ripened by the free exposure to the sun, whilst they are sheltered from rains, and the pots are shaded from the sun. Care will be taken by affording them sufficient moisture at the roots, that the plants are not prematurely ripened, and I find that, by putting the Vines into these frames for a few weeks, they get better ripened than when turned into the open direct from their growing quarters. These Vines will be placed against a south wall towards the end of the present month, and shortened back to the required height, removing the laterals and weak wood by degrees as the growth of the cane finishes. Early Vines which are planted in borders should be heavily syringed, and if red-spider be troublesome, some flowers of sulphur should be mixed with the water used, and the syringings followed up so long as the insects remain on the foliage. A mulching of rotten manure should be placed on the inside borders of these early vineries, and be very sure that the borders are well watered before affording the mulch, and when it is found necessary afterwards. Afford all the air possible to the vineries, but give a little warmth in the hot-water pipes in dull or wet weather. Successional vineries must get close attention in regard to the ventilation, and the outside borders should be covered with something to throw off excessive rain, some of the thin-skinned varieties cracking badly if the roots absorb much moisture, and where these are grown it is a good practice to allow some larger amount of air at night by keeping the back ventilators open, so that much of the moisture may escape. In rainy weather fireheat must be used to maintain the temperature, as a sudden fall of temperature is very apt to cause some injury to the Grapes. In the case of Madresfield Court the laterals should not be stripped off to any great extent, a matter of great importance if a period of warm moist weather should set in. Foster's Seedling is one of the worst sufferers from cracking of the berries. Muscats, also, when ripe, are benefited if the laterals are left, and I question if the roots do not also benefit from the non-mutilation of the summer growth.

LATE HOUSES.—Scalding of the berries should be carefully guarded against by free circulation of air without cold draughts, and by shading any part of a vine that gets so affected. I would advise the non-removal of laterals from Lady Downes at the commencement of colouring, this alone often preventing scalding. Just previous to the berries turning colour, the vines should have a thorough root watering with liquid manure, and all the seedless berries cut out of the bunches, or good berries removed if the bunches which are to hang late are thought to be too crowded. Large-berried varieties, like Gros Colman and Alicante, require plenty of space to develop. These latter kinds should get every encouragement to finish their stoning to get the berries well finished as early as possible. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

MUSHROOM BEDS—If a sufficient quantity of stable manure is in a suitable condition for making up into beds, no time should be lost in constructing open air beds. Make them of a ridge shape or conical, and choose a hard piece of ground whereon to place them and one from which the rain will freely run off. Materials must be neither too wet or too dry, but in such a condition that no water can be squeezed out of it by hard pressure, yet it should contain enough moisture to enable fermentation to be set up and maintained for several weeks. Thoroughly shake out the materials as the work proceeds, and beat them firmly together, and when the heat has sunk to 80° spawn the bed and cover it with soil to the depth of 1½ inches three days afterwards. Employ heavy loam of good holding quality or any loamy garden soil that is free from vegetable matter, and mix a small quantity of agricultural salt with it. The straw shaken from the manure if kept dry will be found useful for covering the beds, and may be put on to them about 1 foot

thick, and if a waterproof covering of any kind is at hand it may also be placed over the straw. Materials for beds in the Mushroom house should be collected, and when enough is got together for a bed in an open shed it should be often turned over and shaken out, to dissipate the excessive amount of heat and ammonia. Thoroughly clear out all old beds, whitewash the walls, and clean the shelves and bins, and make use of boiling water, pouring it into all crevices to destroy woodlice.

TOMATOS.—These plants which, if strong, were put out against walls or fences, and have received proper care in stopping and thinning out the shoots, will have ripening fruits which should be gathered when sufficiently ripe. By the timely gathering of the fruits as they become fit the plants are relieved and can be kept in good bearing for a long time. Being planted close to walls or fences the plants receive but little moisture from rain, and it is advisable to water them with clear water, and occasionally with manure water, and on light soils to afford them a mulching with spent manure. Remove the side shoots, and remove small and deformed fruits from the clusters.

WINTER SPINACH.—Ground should now be prepared on a warm border for sowing the main crop of Spinach to stand the winter. The land should be in good heart and have been well tilled, and if it be heavy, burnt refuse and wood-ash well mixed with the staple is of great benefit to the crop. Some of the same should be sowed over the land before the seed is covered. Sow thickly in drills 14 inches apart, and thin out to 6 or 9 inches apart, according to variety—Victoria and Monstrueuse de Viroflay are good novelties in Spinach, having large succulent leaves, and they are hardy.

EARLY KIDNEY POTATOS that may be ripe should be dug up, and the sets for next season sorted out. These may consist of the medium-sized tubers, and should be laid out in a partially shaded place to get green. By digging up when ripe, and greening the tubers, they sprout more evenly and better after planting than unripe and unprepared ones; and Kidneys rarely sprout so readily as Rounds.

MISCELLANEOUS.—Winter stuff early planted out will now need to be earthed up, which is always more expeditiously performed before growth has made much headway. Ground which has been cleared of Peas, Potatos, and other early crops, may be planted with Coleworts, no manure being put into the land for this crop if it was manured for the early crops. These Coleworts form an important dish in autumn and winter, and deserve to be well grown. Most varieties may be planted at 1 foot apart, and may then be cleared off regularly, or each alternate plant taken first, the rest being left to reach a larger size. The hoe should be freely used between all young crops whenever the land is dry enough to admit of it. *C. J. Waite, Glenhurst, Esher.*

THE FLOWER GARDEN.

RAISING PLANTS FOR SPRING FLOWERING.—The present time is suitable for sowing seeds of Candytufts, Saponaria calabrica, Silene pendula including *S. p. compacta*, *Eschscholtzias*, *Linaria bipartita*, *Limnanthus Douglasi*, *Nemophila*, *Godetias* in variety, and *Santivahia procumbens*. Sow the seeds of these various plants thinly in drills of about ½ inch deep and 6 inches asunder, on nicely prepared beds, afterwards closing the drills and treading and raking the ground level. A south or west border is the best place for the beds, and by sowing it thinly, no after-thinning of the seedlings will be needed. The beds of Pansies, Violas, Primroses, Myosotis, Daisies, and Wallflowers in the reserve garden should be weeded and watered whenever necessary; and should the stock of Pansies and Violas be less than the requirements, it may be yet increased by division. Violas are not only useful and showy spring flowers, but they are just as effective in summer. In these gardens Golden Gem and Blue Perfection Violas are used with admirable effect mixed with Bijou, Margiesi, and golden bronze Pelargoniums, a combination of colour that is quiet and pleasing. When the Pelargoniums are cleared away, these Violas remain, and make a fairly good display during the later autumn months and in early winter, and which increases in beauty as the spring approaches. The tuberous Begonia increases in popularity as a summer bedding plant, and by saving seed from the finest flowers every year, sowing it early in January,

and growing the plants on, and again weeding out the least handsome flowers, a good strain is in time secured. Plants of two and three years old, which produce fine masses of foliage and flowers, the latter having broad and stout petals, should be selected as the seed-parents. The double-flowered varieties also gain in favour as bedders and pot plants. They are even better wet-weather flowers than the singles. Planted either in mixed or separate colours in beds ranging in size from 3 feet to 10 feet in diameter, the effect is very satisfactory.

PROPAGATION—There are now plenty of Pelargonium cuttings to be had, and propagation should be completed as soon as possible, that is, when it can be done without interfering with the desired shape and beauty of the beds. The cuttings will do very well dibbled into shallow boxes of a uniform pattern as recommended in a previous calendar, which should be filled with light mould and have a surfacing of silver-sand. Put in the cuttings about 2 inches apart, water them, and place the boxes in a dry situation and fully exposed to the sun, on pieces of board, slate, &c., to keep them off the ground. Sprinkle them lightly in the afternoon if the day has been bright and warm. I have found this plan to answer as well in the cool north, 90 miles beyond Edinburgh, as in Wiltshire. A bed composed of three parts of leaves and one of long dung thrown together for ten or twelve days and turned twice in that time should be prepared for striking cuttings of Verbena, Lobelia, Alternanthera, Mesembryanthemum, Heliotrope, Salvia, &c., in a week or two hence.

GENERAL WORK.—This consists in mowing, trimming the hedges, brushing, weeding, and rolling of walks, and the cutting into shape with the knife evergreens of various kinds, and the picking off of all overblown flowers and decayed leaves as soon as they appear. *H. W. Ward.*

THE HARDY FRUIT GARDEN.

APPLES—These are fast swelling, and although at one time the prospect of plenty of fruit was, indeed, anything but good, there will be a nice crop of the earliest and mid-season sorts, but late varieties are poor. At the present time, and so long as soft fruit lasts, it will be advisable to use Apples very sparingly. Lord Grosvenor, Lord Suffield, Keswick, and Lord Derby are among the best for culinary purposes, and where heavily cropped, some of the largest may be gathered, and their removal will improve the size of those left. See that all young trees with good crops have their branches made secure against wind and the weight of fruit, or they may get broken, which will spoil the appearance of good trained standards.

Dessert sorts should be carefully watched, and such sorts as Mr. Gladstone picked as soon as the fruits are approaching to ripeness, or the birds will destroy the best fruits. This is a variety which usually crops well, and is of very good flavour when gathered in time, but if left hanging it becomes dry.

PEARS.—Many of these will soon be ripe, the earliest, Doyenné d'Été, a small sweet Pear, is nice if gathered at the right time; this variety crops well, but keeps for only a short time. Colmar d'Été is a little later, but larger, and good-flavoured; When gathering, do not take too many at one time, but prolong the season by gathering a few at intervals of a couple of days.

CURRENTS, RED AND WHITE.—These should be netted over and made secure against birds: those on north walls will keep for some weeks, and will be found useful for dessert when other soft fruits are over. Bushes which have been stripped of fruit should have all suckers removed, and if the top growth be strong, shortened, or the ends broken, and left to hang. In shortening leave fully 6 inches of new wood, and in thinning out the centres reserve a few of the most suitable shoots for filling up with. As light and air are greatly needed for ripening the wood no time should be lost, so soon as it can be done, to relieve overcrowded bushes of useless wood.

FRUIT-ROOM.—This should be thoroughly cleansed, whitewashed, and put in order for the reception of the fruit. Keep the ventilators open day and night; the woodwork should be well washed and made perfectly clean. This job and many others, such as making labels, pegs, cutting shreds, &c., can be done when the weather is wet. *H. Markham, Mraworth Castle, Maulstone.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK

MEETINGS.

MONDAY, AUG. 10. } Royal Botanical Society of London : Annual Meeting.

TUESDAY, AUG. 11. } Royal Horticultural Society : Committees and Lecture on Ornamental Stone and Greenhouse Plants, at the Drill Hall, James Street, Westminster.

SHOWS.

TUESDAY, AUG. 11. } Royal Horticultural Society : Show of Carnations for Mr. Martin Smith's prizes, James Street, Westminster.
Clay Cross Horticultural Society.

WEDNESDAY, AUG. 12. } Cardiff Horticultural Society (two days).

THURSDAY, AUG. 13. } Maidenhead Horticultural.
Taunton ditto.

SATURDAY, AUG. 15. } National Co-operative, at the Crystal Palace.
Bowling Horticultural.

SALE.

FRIDAY, AUG. 14. } Established and Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°·7.

Horticultural Instruction in Schools. In the rural districts much might be done in schools in the way of instilling into the minds of the scholars a knowledge of the "common things"—plants, birds, insects, soils—by which they are surrounded. Whilst the pupils are thus being taught to observe facts, the inferences to be derived from them may also be cautiously explained, so that some knowledge of the principles governing these facts may be obtained, and the pupils be taught not only how to observe but how to think, so that they may be enabled hereafter to apply their knowledge to some useful purpose. Many a lad, even among the most illiterate peasantry, is blessed by Nature with sharp powers of observation, but few indeed are capable of thinking. In our systems of education we too often neglect to avail ourselves of the natural faculty of observation and to develop and guide it, whilst we reduce thinking to a mere exercise of the memory. Moreover, the things we set down to be remembered are statements in books instead of the facts themselves. Of course, books are indispensable, but only as aids and adjuncts. The poor children are not to blame, it is the teachers and the system of teaching that in the first instance require improvement. This is a subject which from time to time during the half century's existence of this journal we have urged upon the attention of our readers. Some of the older ones among them will not have forgotten the writings and doings of the late Professor HENSLOW as recorded in these columns, and will retain a vivid recollection of what he effected in a rural parish in Suffolk, originally of the most unpromising character. The agitation that has been promoted with a view to extend and improve fruit cultivation has set many people once more thinking what can be done towards the cultiva-

tion of the minds of the labourers of the future. Many a landowner, as we know, has supplied his tenants and the cottagers on his estate with a few fruit trees of approved sorts, but this is not all that is wanted. Knowledge and intelligence are required, and these cannot be bought from the nurseryman and distributed by philanthropic landlords. They must be instilled gradually into the minds of the coming generation, who then, when the time comes, will be able to avail themselves properly of the generosity and good feeling of the landlords.

Take the Potato disease as an example. The means of prevention and palliation on a large scale are still on their trial, not that there can be the smallest doubt as to their efficacy—that has been proved. What we want to know now is, whether, on a large scale, such measures are economical—whether or no the cure will not be more costly than the price obtained for the resulting crop will justify? But in the isolated garden of the cottager—and even in a properly managed allotment garden—the disease may certainly be circumvented at comparatively little cost, and the cottager secure, at least, a large proportion of the crop, where otherwise he would get none. It is not desirable to teach the labourer or the labourer's child the minutiae of entomology or of cryptogamic botany; botanists themselves are not in accord on all these matters, and profound obscurity still reigns over some of them. But there is no difficulty in actually showing to the children the principal facts in the life history of insects or the growth of moulds and mildew, and in making them appreciate for themselves the conditions favourable to such growth. In like manner the precautions to be taken and the remedies to be applied can often easily be demonstrated and explained. A pot of jam or a rotten Strawberry covered with mould can be made by an intelligent teacher into a first-rate object lesson for the purpose of instilling the kind of knowledge we are advocating.

But to return to fruit culture. At Sewardstone, in Essex, Mr. W. MELLES has planted a collection of Apples, Pears, Plums, Cherries, and bush fruits for the purpose of enabling the principles of fruit culture to form part of the educational curriculum at the Sewardstone Board School. The collection embraces all the most useful varieties, and the trees are planted in such a manner that they form a border of some width to the spacious playground. The boys and girls will share in the work of attending to the culture of these trees, and on certain days the head master, Mr. SPINK, who, by the way, is a great enthusiast on the subject, will give them lessons on theory and practice. Mr. SPINK has drawn up a graduated scheme for teaching fruit culture as a specific subject to his scholars, and this is being submitted to H.M. Inspectors for their approval, so that the children may in due course be examined thereon. Article 16 of the Educational Code provides for specific subjects being taught, and Mr. SPINK has done wisely in choosing fruit culture as one of these, especially as the scholars live in a country district.

According to Mr. SPINK's scheme, the children will first be taught the botany of an Apple blossom and fruit, followed by difference between seedling and parent, planting, mulching, summer and winter pruning, thinning the fruit, insect pests, packing, and storing the fruit. This will constitute the first stage. The second stage will deal with the food of fruit trees, manures, course of sap; and the third, the art of propagation. The first stage in the scheme covers a variety of subjects, but Mr. SPINK has been

obliged to do this because most of the boys leave the schools when they have passed the fifth standard, and hence it is needful to let them know as much of the first stage as possible before they do so. This is an excellent idea, and one which might be followed with advantage by other schools in country districts. The exterior walls of schools might be turned to good account for growing Peaches, Apricots, and the finer kinds of Pears and Plums. If the head master could not undertake the practical management of such trees, some of the gentlemen who reside in the parish would, in such a case, be doing an excellent service by allowing their gardener to pay occasional visits and advise, as well as give practical illustrations of the systems of pruning, disbudding, &c.

Mr. MELLES' interest in fruit culture is not confined to providing the school with fruit trees. He has recently rendered still further service to the cause by having every Apple and Pear tree in the hamlet labelled with a number, this number being registered in a book kept by him. As each tree, whether old or young, bears fruit, samples of the fruit, together with the number affixed to the trees, are to be sent to his house, when the correct name, if any, will be given on a permanent label, which is to be afterwards affixed to the tree. This plan will enable the cottagers to be in possession of the names of their fruit trees, and to better judge whether the variety they cultivate is worth growing or not.

In Mr. MELLES' own garden, as we learn from *Amateur Gardening*, is a fine collection of fruit trees grown in pots in cool improvised structures, and he has besides an orchard of the choicest kinds.

The Royal Caledonian Horticultural Society's Great International Show.

THE prospects of this great horticultural event exceed the most sanguine expectations of the committee. It will, in a marked manner, be international, as France, Belgium, Germany, and other European countries have signified to the Secretary that they will send contributions. Canada and the U. S. of America, New Zealand and Australia will also be represented. The committee are at present embarrassed with the consideration of space for all that is likely to be forthcoming as non-competitive exhibits. No estimate can yet be formed of the bulk of competitive subjects, but it may be confidently stated that it will greatly exceed anything that has appeared at any former international show of this society. The Waverley Market, large though it is, will, it is feared, be all too small for the requirements.

A RANGE OF GLASSHOUSES ERRECTED FOR CHRISTOPHER FURNESS, ESQ., M.P., WEST HARTLEPOOL (Supplementary Illustration).—The range of glasshouses represented in our Supplement, and erected by Messrs. W. RICHARDSON & Co., Darlington, from designs furnished by JAS. GARRY, Esq., architect, West Hartlepool, for C. FURNESS, Esq., M.P., shows a favourite style of arranging the principal glass structures in a modern garden, the chief aim being contiguity, so that no time should be lost in passing from one portion of the range to another; economy in heating arrangements, and the mutual conservation of heat, and cheapness in construction—one partition serving for two houses. Moreover, in a northern climate, there is an advantage in having the range backed by a wall with offices behind it over a range not so protected on its northern side. The only drawback—leaving the aesthetic out of view—is that there is no great variety of aspect to suit the varying requirements of plants. The range is 170 feet long, and consists of a Palm-house in the centre 40 feet long by 23 feet wide, with

RANGE OF HOUSES ERECTED BY MESSRS. RICHARDSON & CO., FOR C. FORNESS, ESQ., M.P.

an ornamental south entrance measuring 9 feet by 4 feet; a Peach-house and a late vinery are on the left, and an early vinery and Cucumber and Melon-house on the right hand, each being 45 feet long by 14 feet 6 wide. A span-roofed greenhouse is on the left or west side of the late vinery, and a warm house on the east of the Cucumber-house, each house being 18 feet long from the back to the front by 14 feet 6 inches wide. An octagonal-shaped fernery is built at each of the ends of the range at the outer angles, and these ferneries measure 10 feet by 10 feet. There are also ornamental open-work verandahs across the ends. The work was finished in an excellent manner, and with all the latest improvements in ventilation, and the various houses are calculated to answer the various purposes for which they are required. The upright framing is neatly moulded and reeded, and the rafters and bars moulded and constructed in a substantial manner, heavy timbers being avoided by the use of a special kind of truss and tie-rod. Ornamental columns of cast-iron, with arched spandrils, support the large lantern of the Palm-house, giving to the interior an imposing effect. The roof bars and rafters are of a special make, formed so as to prevent leakage through the cracking or peeling of the putty, also with a channel down both sides for conveying away moisture which may condense on the glass. The whole of the compartments are ventilated on the latest approved principles. Roof or top-ventilation is obtained by hinged lights made to open simultaneously in each compartment by Richardson's improved screw lifting apparatus, and bottom ventilation by pivot-hinged sashes, all with simultaneous gearing. The interior of each compartment is well fitted up, the Palm-house, stove-house, and two ferneries having slate and iron staging, with cast-iron supports, and the greenhouse has a trellised flat stage of wood and centre stage arranged in tiers. The vineries, Cucumber-house, &c., are wired in a manner suited to their several purposes. Special provision is made for the collection of rain-water from the roofs by making a tank under the floor of the Palm-house, and having galvanised iron cisterns in the other compartments. Twin boilers set in a building behind the range furnish the heat for the various divisions. A Richardson's patent hooded tubular heats the range easily and economically; and the other is an improved tubular saddle, with a double row of top tubes made by the same firm. The boilers are connected so that they can either be worked together or separately.

FRUIT CULTURE.—The subject of fruit culture in small holdings was well dealt with at the Conference of the British Fruit Growers' Association in Beddington Park, on August 3, concerning which the energetic Honorary Secretary, Mr. L. CASTLE, enables us to give some particulars:—

The special intention was to bring the subject of fruit culture before the numerous cottagers and allotment holders in the district, to point out to them the advantages that would result from due attention to the matter, the best modes of proceeding in the work, and the difficulties to be expected. Plenty of instances could be given where the fruit produce alone is made to pay the annual rent of the cottage, besides yielding a supply of fruit for home use, either fresh or preserved. Several speakers at the Conference in question touched upon this aspect of the subject, and its importance is fully recognised by all who are concerned in the welfare of the working population of rural districts.

Referring briefly to the proceedings at Beddington Park, it must be said that the Chairman, Sir JAMES WHITEHEAD, Bart., dealt in his opening address with the subject of fruit culture most fairly and thoroughly. Special reference was made to the efforts of the Royal Horticultural Society, the Fruiterers' Company, and the British Fruit Growers' Association in the direction of inducing greater interest in the matter. The Chairman complimented the Association upon the work they had accomplished for so small an expenditure, and expressed good hopes for the future.

Much help could be rendered by landlords in planting fruit trees themselves, or in providing trees for their cottagers to plant, and by encouraging the latter they would also be improving the value of their estates. The cost of carriage to markets was also touch'd upon, and several serious anomalies were mentioned, notably in the heavy charges of cartage from terminal railway stations to the markets as compared with the rates per ton from station to station. Instances were given where the cartage rates by the railway companies are four or five times in excess of the ordinary carriers' rates, and it was mentioned that the recent re-arrangement of railway rates did not include cartage, so that much remained to be done in that respect.

So wide a scope did the Chairman cover in his address that some subsequent speakers confessed that he had left little for them to say on general topics; and Mr. T. FRANCIS RIVERS, who followed, confined his remarks to a brief consideration of the aspects of foreign competition in relation to home growers.

Then came Mr. J. WRIGHT, with "Object Lessons for Cottagers and Allotment Holders," the subject being brought before the audience in the best possible way. Time only permitted reference to Strawberries, Raspberries, and Gooseberries; but defective and correct methods of planting, pruning, and general culture were clearly indicated, and many useful hints were given for the guidance of the inexperienced. In concluding, he read a letter from a tenant, in which a simple method of dealing with the difficulties arising from planting fruit trees was mentioned, the custom being for the incoming tenant to pay a valuation for trees planted by the former occupier, or for the landlord to take them in the same way, and then charge it to the new tenant. The plan had answered so well that it had raised the value of the land enormously.

"How to encourage fruit culture among small farmers and cottagers" was the next subject, which was taken up by Mr. G. HAMMOND, an extensive fruit farmer in Essex, and treated in a thorough manner. The difficulties in relation to land tenure were pointed out, the necessity of securing the landlord's co-operation and consent was dwelt upon, also the desirability of adopting the custom of valuation for tenants' improvements for work of this kind. Continuing, Mr. HAMMOND said:—

"As to the amount of profit to be made by growing fruit, many wild and extravagant statements have appeared, which only tend to mislead and disappoint. What this Association has said, and what it still maintains, is this,—That with a proper selection of sorts suitable for each district, together with careful and attentive culture, a reasonable return may be confidently expected, quite sufficient to justify many in incurring the necessary expense of planting."

Concerning technical education the Rev. T. W. SHARPE, Her Majesty's Inspector of Training Colleges, said he felt certain that the introduction of a system of agricultural and horticultural training in schools in rural districts would readily be taken up by the Education Department. He rejoiced in the fact that the Surrey County Council could devote £15,000 per annum to purposes of technical education, and was sorry that the London County Council did not do something in the same direction. Sir JAMES WHITEHEAD said he had for some years advocated technical instruction in regard to agricultural and horticultural pursuits in rate and State-supported schools.

A practical address on the preparation of the soil for fruit trees was delivered by Mr. JOSEPH CHEAL. Mr. A. H. SMEE followed with a few suggestions upon the renewal of old orchards and fruit plantations, and the business concluded with a hearty vote of thanks to the Chairman, proposed by Mr. GRANVILLE LEVESON-GOWER and seconded by Mr. HALSEY, of the Surrey County Council.

The show in connection with which the Conference was held was remarkable for splendid collections of vegetables, fruit not being sufficiently grown in the

district to make a display; but a few excellent collections and individual dishes demonstrated what could be done in that direction.

THE POTATO CROP.—The report on the condition of the Potato crop which we publish in the present issue is generally of a hopeful character, although from the exigences of circumstances it was prepared a little too soon. The haulms were very generally cut back by late frosts, but they started well after, and up to the date of our report, little disease had appeared. These hopeful prospects must, however, be seriously discounted by the subsequent appearance of the Potato mould. The wet weather is propitious to its growth, but as the temperature is low we may well hope that the growth of the fungus will be limited in amount. In the meantime it is still possible, to some extent, to control and mitigate the disease either by high moulding or by the use of copper-sulphate in some of the methods so often mentioned. These means will be specially beneficial in small isolated gardens such as those tilled by cottagers. Of course, every means should be taken to destroy the diseased haulm by fire, and to discontinue propagating the disease in the efficient manner now almost universal. Equally, of course, we are sorry to say, nothing will be done. As we write, waggon loads of Potatoes are passing our windows, packed with rotting haulm. Let the reader, in imagination, follow the course of this to the manure heap, and he will judge how careful we are to propagate and extend the pest whose ravages we deplore.

OUR JUBILEE YEAR.—The large number of letters of congratulation that we have received has been indeed a matter for satisfaction to us. Many of these have been of so personal a nature that it would be unbecoming in us to make them public, and we have been constrained either to omit their publication entirely or to "edit" them very severely before they could be allowed to meet the eyes of our readers. The following letter, however, in justice to our contributors, past and present, and as appreciative of our endeavours, we cannot refrain from making public, and at the same tender our heartiest thanks to the honoured writer:—"Your valuable publication is now, I am aware, in its fiftieth or Jubilee year, and, though somewhat late, I should not like to omit sending you my hearty congratulations on the felicitous event. I think, too, you will perhaps be pleased to know that I am one of your oldest subscribers having taken in the *Gardeners' Chronicle* for the last forty-eight years. I can assure you that its arrival each succeeding week during this long period, has ever been looked forward to by me with pleasure, knowing that its contents would be sure to be not only interesting, but above all accurate or reliable, and consequently a never-failing source of profit. I feel therefore that I am deeply indebted to the original founders and to those editors and correspondents of the journal who have passed away as well as to yourself and your numerous scientific and practical fellow-workers who are so untiring in contributing the results of their experience to its pages, and thus rendering them invaluable to all who are interested in plants and flowers. In conclusion, I sincerely hope the *Gardeners' Chronicle* will continue to retain, and for very many years to come, the enviable position it holds among the publications devoted to the advancement of horticulture.—ERNEST BENARY, Erfurt."

GARDENERS' ORPHAN FUND.—At the usual monthly meeting of the committee, held on July 31, at the Horticultural Club, Hotel Windsor, W. MARSHALL, Esq., in the chair, the following special contributions were announced:—Flower-stall at the Richmond Horticultural Exhibition, per Miss Ford, £6 10s. 6d.; flower-stall at the Croydon Horticultural Exhibition, per Mr. G. W. Cummins, £11 5s. 6d.; sale of flowers at the Royal Aquarium Rose Show, per Mr. R. Dean, £13 15s. 6d.; Wimbledon Horticultural Society, £11 0s. 6d.; Ware and District Horticultural Society, per Mr. R. Dean, £1 11s. 6d. From collecting-boxes as follows:—Mr. D. T. Fish, opening of Hardwicke Gardens, Bury St. Edmunds,

£11 15s.; Mr. W. Brown, Florist, Richmond, 4s.; Mr. W. H. Divers, The Gardens, Ketton Hall, Stamford, 12s. 1d.; Messrs. Cannell, The Nurseries, Swanley, 11; Miss Barron, Chiswick, 18s. 9d. The Hon. Secretary reported that over 10,000 collecting-cards were issued in view of the national collection, and that the sum returned amounted to over £250. The committee adjourned until the last Friday in September.

THE HORTICULTURAL CLUB—The annual excursion of this Club took place on Wednesday, July 29, when Crawley and the neighbourhood were selected for a visit. The weather proved somewhat unfavourable, but the party to the number of twenty-four, including several ladies, alighted at Three Bridges Station, entered the three brakes provided for their accommodation, and drove off through Crawley to the nurseries of Messrs. CHEAL & SONS. They were there received by the members of the firm and staff, and immediately commenced a tour of inspection through these grounds, and as far as time would allow, examined the numerous subjects of interest, especially amongst the fruit, herbaceous plants, flowering shrubs, and Dahlias, and before leaving partook of light refreshment upon the lawn adjoining the house, under the leafy shade of the overhanging trees. They then re-entered the brakes, and drove to Worth Park, the residence of Mrs. MONTERRONE. They were received by Mr. GLEN the gardener, and were conducted in the first place through the various greenhouses and kitchen gardens. They then entered the corridor surrounding the winter garden. The space enclosed by this long corridor is laid out in an elaborate geometrical design, with fountains in the centre, and the beds are now gay with brilliant flowers. The broad terraces and Italian gardens adjoining the mansion were next inspected, and a tour of the park was commenced; the party were led by winding paths through woodlands and shrubberies surrounding the beautiful lake to the farmstead, where they were met at the model dairy by the steward, Mr. MARE. They were here hospitably entertained at luncheon. After the luncheon Mr. D'OMBRAIN expressed the gratitude of the members to Mrs. MONTERRONE for her most kind and generous reception of the Club, and complimented Mr. MARE and Mr. GLEN upon the excellent condition of the whole establishment. Mr. WILKS seconded on behalf of the Royal Horticultural Society, and Mr. MARE suitably responded. After this the party were conducted by Mr. MARE over the working dairy, and the various buildings of the model farmstead. The brakes were again mounted, and the party started for a long drive through Tilgate Forest with its lovely scenery to Handeross Park, the residence of Mr. WARREN. They were here met by Mr. OFFER, the steward. The gardens contain a rich collection of Japanese and other dwarf Conifers, most of which presented a particularly healthy appearance, and have passed through the late severe winter unharmed. The party then started for a long tour of inspection through the undulating forest-land surrounding the gardens, where the natural wildness of the scenery is undisturbed; but its charms are added to by the judicious planting of a large assortment of ornamental trees. And here, in wild and natural beauty, may be found a collection of Coniferae, consisting of all the known varieties that will thrive in this country. The winding paths of velvety turf through this heather-clad forest having been traversed, the party came back to the gardens, where the conservatories were visited, and the unequalled specimens of stove and greenhouse plants which have gained such wide reputation, were greatly admired. The clubbists left the residence of Mr. WARREN amidst continuous rain, and returned towards Crawley by way of St. Leonard's Forest, driving through the grounds of Holmbush Park, the residence of Col. CLIFTON BROWN. Most of the party, in spite of the rain, left the brakes, and walked through the pleasure-grounds, over which they were conducted by Mr. PATTERSON, the gardener. They then returned to the "George" Hotel at Crawley,

where an excellent dinner awaited them. The cordial thanks of the Club were given to Mr. D'OMBRAIN and Mr. CHEAL for carrying out the arrangements, and the party then re-entered the saloon carriage which awaited them at Crawley station, for the return to town.

STEPHENS' BOOK OF THE FARM.—By the issue of the sixth divisional volume (Part 2 of Volume III), the publication of the new edition of this standard work is completed. The many changes and new developments which have arisen in British agriculture during the twenty years since the publication of the third edition, have rendered it necessary not only that the entire work should be recast, but that several new chapters should be introduced. This concluding divisional volume includes an exhaustive chapter on farm buildings, embracing a large number of plans of farm steadings; plans for dwelling houses for farmers and farm cottages are also given. The complete work is now also published in three handsome volumes, strongly half-bound in leather, extending in all to over 1640 pages. The fulness of the index, and the exhaustive character of the work, will be gathered from the fact that the index alone contains upwards of 4200 references. We can thoroughly recommend the book as trustworthy and adequate.

HYBRID LILIES.—Dr. MACFARLANE obligingly sends us the subjoined note concerning the interesting hybrid raised by Mr. POWELL between the dark Dalmatian variety of *L. Martagon* and *L. Hansonii*:—"By the kindness of Mr. C. B. POWELL I received fully a fortnight since a magnificent flowering shoot of the above Lily hybrid, flowered for the first time by him last year, and noticed by you in the *Gardeners' Chronicle* of July, 1890. Its parentage is almost identical with that of the hybrid flowered this season, at Haarlem, and recently described by Mr. BAKER. Whether it be owing—as it probably is—to the bulbs being young and vigorous, certain it is that the specimens sent overtopped in stature and flower production either of the parents as grown here, so that the specimen quite recalled KÖLBEUTER's description of some other hybrids which showed *statura ponderosa*. The hybrid has a special interest, as being the progeny of species very nearly related systematically, but widely isolated in geographical range. *L. dalmaticum* is a South European and Himalayan form, while *L. Hansonii* is Californian. In naked-eye characters, Mr. POWELL considered that the stem and leaves showed little of the *Hansonii* parentage; but a comparison, both last year and this, soon convinced me—in spite of Professor MEEHAN's remonstrance—that Nature had followed her common laws, and that we had a very even fusion of parent peculiarities. The leaf-colour of *L. dalmaticum* is a deep purple-green, of *L. Hansonii* a bright green, while a leaf of the offspring placed between, formed a neat transition in tint. I have been prevented as yet from making a complete microscopic examination, but from study of the leaf epidermis as to cell shape, number of stomata, &c., I fully expect that the hybrid will come very fairly between the parents in its vegetative parts. The flowers, however, Mr. POWELL truly remarks, are as exactly intermediate as one could expect. The mingling in diluted degree of the deep purple colour of the seed parent with the yellow and spotted condition of the sire is a very nicely balanced one. As stated by Mr. BAKER, Lily hybrids have been a rarity, but after microscopic examination of the pollen and ovules of this one, I feel tolerably certain that it may be perpetuated in a pure state, or crossed successfully with either parent or another species. The pollen grains seem good to the extent of from 90 to 95 per cent., thus almost equalling the parents. The ovules are well formed, and contain an egg-cell and help-cells of vigorous appearance. It remains for future experiment to prove or disprove the accuracy of this conclusion. On receipt of the specimen in full bloom, it was found that *L. Hansonii* had finished flowering in the Edinburgh Botanic Garden by a full week, while *L. dalmaticum* was in bud, and only opened on July 29. On

inviting an expression of Mr. POWELL's experiences, he wrote, 'Your observation as to the flowering period of the hybrid being intermediate is correct, for the plants of *Hansonii* here bloomed before any hybrid expanded, and the other parent, *dalmaticum*, is now (July 28) in bloom, ten days after the others were over.' Mr. POWELL informs me that he has obtained seeds of a Fritillary cross which, if successfully germinated and reared, should prove startling. Let us hope that they may show themselves amenable to the skilful treatment they are sure to receive."

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the above on the 11th of July, 1891, the Floral Committee awarded the following first-class certificates to Messrs. De Graaff Brothers, at Leiden, for *Antholyza athiopica major* (new plant), *Babiana disticha* (new plant), *Bartholina pectinata* (new plant), *Delphinium Przewalskiana* (new plant), *Ferraria undulata* (insufficiently known plant); to Messrs. E. H. Krelage & Son, at Haarlem, for *Gladiolus ramosus* Hort. var. *Mad. Blanche Bourlon* (insufficiently known plant), *Hæmanthus multiflorus* Martyn var. *Kalbreyeri* (insufficiently known plant), *Iris Kämpferi* var. *Nicolaas Beets* (new plant), *Iris xiphoides* Ehrh. var. *J. Victor* (new plant), *Pelargonium* (Regal) *Princess Alexandra* (new plant), *Pelargonium* (Regal) *Princess Victoria* (new plant); to Mr. G. C. Van Meeuwen, at Haarlem, for *Achillea ptarmica grandiflora*, fl. pl. (new plant), *Ixia Beauty of Haarlem* (new plant), *Lilium biligulatum Beautiful Star* (new plant), *Lilium biligulatum Beauty* (new plant); to Messrs. Ant. Roozen & Son, at Overveen, for *Begonia tuberosa hybrida Masterpiece* (new plant); to Mr. C. W. R. Scholten, Jr., at Amsterdam, *Cattleya labiata Mossia alba*; to Mr. C. G. Van Tubergen, Jr., at Haarlem, for *Calochortus Howelli* (insufficiently known plant), *Calochortus Palmeri* (insufficiently known plant); to Mr. G. S. M. Wendelaar, at Beek, for *Lissochilus speciosus* (new plant); to Mr. K. Wezelenburg, at Hazerswoude, for *Aucuba japonica crassifolia aurea* (new plant), *Spiræa crispifolia* (bullata) (insufficiently known plant), *Spiræa macrophylla* (mandschurica) (new plant); to Messrs. Zocher & Co., at Haarlem, for *Catalpa Kämpferi purpurea* (new plant); *Pirus heterophylla* (new plant).

Second-class certificates were awarded to Mr. J. T. Van Den Berg, Jr., at Jutfaas, for *Delphinium hybridum Télégramme* (insufficiently known plant), *Delphinium hybridum No. 11* (new plant); to Messrs. De Graff Brothers, at Leiden, for *Delphinium Brunonianum* (insufficiently known plant); to Messrs. E. H. Krelage & Son, at Haarlem, for *Lilium elegans atropurpureum* (new plant); to Mr. G. C. Van Meeuwen, at Haarlem, for *Alstromeria revoluta*, (new plant), *Ixia Glory of Haarlem* (new plant), *Lilium biligulatum Prince of Wales* (new plant), *Lilium biligulatum The Sultan* (new plant); to Messrs. Van Namen Brothers, at Zwijndrecht, for *Solanum tuberosum fol. var.*; to Mr. K. Wezelenburg, at Hazerswoude, for *Hydrangea hortensis tricolor* (new plant); to Messrs. Zocher & Co., at Haarlem, for *Ligustrum japonicum aureo-marginatum* (new plant).

FATAL ACCIDENT FROM THE FALL OF A BOUGH.—The Hereford papers have lately recorded the death of two children from the fall of a bough of an old Elm. The bough was 30 feet long, covered with foliage, and the broken surface exhibited no special signs of decay. Periodical inspection of the trees, it is stated, was made, and all ordinary precautions taken against accident. Such accidents are not unfrequent, especially in the case of the Elm. As usual, the accident occurred in fine weather, when there was little or no wind.

THE RANELAGH NURSERY, LEAMINGTON.—On Mr. C. CRUMP leaving the Ranelagh Nursery at Leamington a year or so ago in order to embark upon a more extended sphere of fruit culture, Mr. ROBERT GREENFIELD, for many years gardener to the late THOMAS LLOYD, Esq., of The Priory, Warwick,

and who left consequent upon the death of Mr. LYON, became the lessee of this place at Leamington. The nursery, once a private garden when Leamington was a far less populated and fashionable place than it is now, was established by a Mr. CULLIS in 1810. It then passed into the hands of Mr. PARSONS, subsequently to those of Mr. J. H. HAWLEY, then to Mr. E. CRUMP, and finally to Mr. GREENFIELD. Fruit growing is a leading feature. There are seven vineries, four of them being late houses, Alicante, Gros Colman, and Lady Downes being largely grown, and the vines are in excellent condition and carrying excellent crops. Mr. GREENFIELD states that notwithstanding the rigours of last winter late grapes hung well until March. Then there is a large grape room for bottling. There is also a Peach House and houses for Cucumbers, Tomatoes, Roses, Stove, three ferneries, Orchard-House, conservatory, frames, &c., and a small nursery ground is attached. A large and growing cut-flower trade is done. There are many fine specimen Azaleas, especially of Fielder's White, Roses, Bouvardias, Tuberoses, Allamandas, and Stephanotis, trained to the interior roofs, which supply bloom pretty well all the year round; Eucharis amazonica, Lilies, Poinsettias, large quantities of Ferns, Adiantum cuneatum and Pteris tremula especially, Palms, &c. In one of the houses the Glory Pea of New Zealand, Clanthus Dampieri, is in very fine character, bearing rich scarlet flowers, with the large purple-black boss at the base of the standards. In the open ground are a large number of Chrysanthemums for cutting, Dahlias, Marguerites, Asters, &c., and a great number of the leading kinds of bedding plants are grown in the proper season. In Bath Street, Mr. GREENFIELD has a shop for the sale of seeds, fruits, plants, &c., and the growing trade necessitates that he should secure larger premises with more ample accommodation. *Visitor.*

FIFTH REPORT OF THE UNITED STATES ENTOMOLOGICAL COMMISSION.—This report, which forms a thick 8vo volume, is published at the Government printing office at Washington, and is substantially a revised and enlarged edition of Dr. PACKARD'S *Insects Injurious to Forest and Shade Trees*. Though applying especially to the United States, there is very much that will be of service on this side of the Atlantic. Indeed, the book is a veritable cyclopædia on forest entomology, dealing with the insects attacking various trees in their several parts, and with the best methods of preventing their ravages or of palliating the consequences. Numerous woodcuts, no fewer than forty plates, and elaborate indexes go to make up a book of first-rate importance and value.

COLORADO.—The eighth annual report of the Chamber of Commerce at Denver (Colorado) is before us, and is truly a wonderful record of progress in a short time. Thirty years ago a mere miners' camp, Denver now contains 150,000 people and all the appliances of a great city. The pioneers of Colorado were thoroughly convinced that no vegetable growth was possible on the great American desert except the Cactus, Sage, Yucca, Buffalo-Grass, Scrub Oak, and other "brush." Now the history of the world may be challenged to furnish another transformation as radical as that which occurred within about fifteen years. The prairie has been changed as by magic into the grain-field, the orchard, the garden, and the flower-bed. This state of things is reflected in the statement that whilst in 1890 the mineral produce of the country amounted to 35,000,000 dollars, the agricultural products were recorded at 44,000,000 dollars. The health-giving climate is attracting numerous sojourners, and if Colorado had given us nothing but the blue Spruce (*Picea pungens glauca*) she would have earned the gratitude of horticulturists.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The series of prizes offered by MARTIN R. SMITH, Esq., on July 21 were not competed for, owing to the season of the year being too late for Carnations; but Mr. SMITH is still anxious that

the prizes should be competed for, and again offers them on the occasion of the Royal Horticultural Society's meeting at the Drill Hall, James' Street, Westminster, on August 11, 1891. Notice of entry must be given to Mr. A. F. BARRON, R.H.S., Obiswick, W., three clear days before the day of exhibition. The Carnation Society will provide bottles if desired. The competition will be as follows:—Class A, the best border variety of self-coloured Carnation, not less than twelve trusses—three prizes: £3 3s., £2 2s., £1 15s. Class B, twelve varieties of self-coloured border Carnations, not less than six trusses of each variety—three prizes: £3 3s., £2s. 2s., £1 15s. Class C, eighteen varieties of flake, bizarre, or fancy Carnations or Picotees, not less than six trusses of each variety—three prizes: £3 3s., £2 2s., £1 15s. The following conditions must be observed by exhibitors:—1. Each exhibitor must sign the following declaration:—I certify that all trusses shown by me for the prizes offered by MARTIN R. SMITH, Esq., have been cut from plants which have been wintered without protection in the open garden, and that they are staged without "dressing," and exactly as they were cut from the plants; 2, each truss to have not less than three flowers or buds; 3, each truss to be cut with stems not less than 9 inches in length; 4, to be shown with Carnation foliage and buds; 5, a specimen of the foliage of each variety to be shown with the flowers; 6, the trusses to be staged in bottles, tins, or glasses; 7, no bands or ties round the calyx, and no paper collars or wire supports to be used; 8, a burst calyx to be a disqualification. Mr. JAMES DOUGLAS is the Hon. Sec.

TIMBER CULTIVATION IN GREAT BRITAIN.—A correspondent recently wrote to Mr. CHAPLIN asking him to give attention to the subject of the growth of timber, and the profitable results likely to accrue from timber cultivation on the waste lands of Great Britain, and suggesting that the Government should stimulate the cultivation of trees, through the medium of the Board of Agriculture, by grants of money towards the initial expense of planting, &c. By Mr. CHAPLIN'S direction the following reply has been forwarded:—"Sir,—I am directed by the President of the Board of Agriculture to acknowledge the receipt of your letter of the 20th June last, relative to the planting of trees on what is at present unprofitable soil in Great Britain, and to thank you for your suggestions, which shall receive due consideration by the Board of Agriculture. I am to add that an inquiry is now being made in the agricultural returns for 1891, to ascertain the present extent of woodlands in Great Britain.—I am, Sir, your obedient servant, RICHARD DAWSON, Assistant Secretary."

MESSRS. DANIELS BROTHERS, NORWICH.—The employes of Messrs. DANIELS BROTHERS, seedsmen and nurserymen, of Norwich, had their yearly outing on Monday, July 27, going from Norwich, to the number of sixty, by road to Cromer, North Walsham, and Aylsham. An agreeable day was spent, the party reaching Norwich about 11.30 P.M.

PAPAVER SOMNIFERUM THE BRIDE AND SNOWFLAKE.—Single Poppies have for some time past been great favourites, and the beauties of the now well-known Shirley Poppies have done much to fix the taste. In McArthur's nurseries, Maida Vale, London, the above-named new satiny-white varieties of an old species have been proved to be very floriferous, and constant in character. The proper method of securing them in the best condition as cut flowers is to take them just as they are about to expand. They will then last a long time, especially if kept in a cool shady room. The Bride has large single white flowers, with wavy edges to the petals; and in Snowflake the flowers are of a similar character, but the edges of the petals are deeply cut and fringed. A vaseful of these pretty white flowers is a very agreeable object.

FOR SALE.—The *Midland Counties Herald* contains an announcement to "Americans" and others seeking an historical residence, that Impington Hall,

near Cambridge, once the residence of the PERRIS family, is to be sold with 300 acres of land. Some Americans, when they become possessed of land in the old country, are greater sticklers for their rights than the most pronounced autocrats, so that it is not altogether with complacency that we see historic mansions falling into the hands of foreigners. True, we hardly consider the Americans as foreigners, and the generation succeeding those who pay the old country the compliment of buying up land may be born Englishmen.

STRAWBERRY SPORTS.—Mr. RIVERS communicates to us a statement, made by a correspondent of his, to the effect that certain strawberry plants which used to yield red fruits now produce white ones, and some both red and white at the same time. The sorts were originally such kinds as Sir Harry, British Queen, Sir Charles Napier, &c. The specimens sent to us were decayed on their arrival, but still retained enough of their original colours to substantiate the above statement. It is hard to account for this arrest of development occurring simultaneously in several sorts. We do not know if there are any circumstances in the nature of the soil or mode of culture to account for the phenomenon, which seems to differ from the sporting consequent on the unmixing of previously crossed elements.

NITRIFICATION.—One of the most important discoveries of recent years affecting the cultivation of the soil is that relating to the action of minute organisms in rendering soluble, and therefore available, certain nitrogenous compounds in the soil. Among English experimenters in this direction Mr. WARINGTON, of the Rothamsted laboratory, takes a leading position. In a paper recently published, Mr. WARINGTON reviews the whole subject, which contains too many technical details to be more than mentioned here; but one conclusion we must cite as showing that there are in the soil at least two organisms, one of which by oxidation converts ammonia into nitrites, the other by a similar process changes nitrites to nitrates. It will be remembered that the difference in the two sets of salts consists in the larger relative proportion of oxygen in the nitrates.

POISONOUS EFFECTS OF CEPHALOTAXUS.—The injurious effects of the Yew when eaten by stock are well known. M. CORNEVIN now shows that the nearly-allied *Cephalotaxus* has similar, but less potent effects. Gardeners should therefore be careful not to leave the cuttings of Yew or of *Cephalotaxus* in places where cattle or horses can get at them.

LATEST OF ALL STRAWBERRIES.—We have received some fruits of Latest of All Strawberries from Messrs. W. LOVEL & SON, Driffild, which, in spite of the badness of the packing, had borne the transit from Driffild very well. It is a pale-coloured fruit, of considerable firmness of flesh, combined with a pleasant flavour. Unless it be later than Elton its name is misleading, although by many its freedom from acidity would recommend it.

FLOWER SHOW AT ST. GEORGE'S-IN-THE-EAST.—On Thursday afternoon, as we learn from the *Daily News*, August 1, Mrs. A. G. CROWDER opened the fourth annual flower show in connection with the St. George's-in-the-East Window Garden Society, the exhibition being held in the grounds of the parish church. In spite of the unfavourable weather, there was a large attendance in the evening, when the LORD MAYOR, who was accompanied by the LADY MAYORESS, presented the prizes to the successful competitors. The Rector (the Rev. C. H. TURNER) explained that Mr. C. T. RITCHIE, M.P. was prevented from fulfilling his engagement to take part in the day's proceedings, and pointed out that some 400 entries had been made for the show, but there were only 200 exhibits. The LORD MAYOR having briefly commented on the desirability of flower cultivation, a cordial vote of thanks was accorded to the civic visitors, on the motion of the Ven. Archdeacon SINCLAIR, seconded by Mr. COLLYER.

CARDIFF SHOW.—On Wednesday, August 12, the Cardiff Horticultural Society's show will take place, and in conjunction with it the British Fruit Growers' Association will hold a Conference at 4 P.M., at which papers will be read by Mr. E. J. BAILLIE, on "Fruit Growing as an Industry," and another by Mr. A. PETHIGREW, on "Hardy Fruits for South Wales." The show, an important one, is expected to be a very successful affair, as it is very well supported.

ONCIDIUM MEASURESIANUM.—There is now flowering at the Woodlands a new yellow and green *Oncidium*, named [provisionally?] *Measuresianum*; the blooms are nearly as large as those of *Oncidium crispum*; the colouring reminds one of the tints found in the rare *Cypripedium Ilyeanum* and *Sanderia*, and is one of those charming combinations of green and yellow which are so attractive.

"THE HAYWARD'S HEATH HORTICULTURAL SOCIETY'S SHOW at Hayward's Heath, on Wednesday, July 29, will be remembered," says the *Sussex Daily News*, "by all gardeners and lovers of flowers who found their way to Hayward's Heath as the grandest collection of flowers, fruit, and vegetables that has been brought together in the district. There was a remarkably strong competition in groups alike of flowers, foliage plants, and Ferns. The floral portion was of high merit, and was the marked feature of the show. Fruit was good, but not very abundant, the season perhaps being hardly favourable to a more than ordinary display of fruit. The vegetables displayed in all sections were of the highest quality. The cottagers' section was first-class in quality, but the number of exhibits was hardly so strong as might have been expected from the wide district covered by the Society. The amateurs' section showed an improvement on last year. In the exhibition there were over 1200 entries, a proof of the increasing interest taken in the exhibition. It was a grand show, but a bad day. The rain fell in heavy showers during the afternoon, interfering with the excellent arrangements made for the outdoor entertainment of the visitors."

GRAND YORKSHIRE GALA FLORAL AND MUSICAL EXHIBITION.—The last duty of the Council and life members of the grand Yorkshire Gala was performed on August 3. Their work must have been of a pleasant nature, as it showed that as a result of the hard work and worry which they had voluntarily undertaken, they were able to hand over £200 to local charitable institutions. As the profits of the Gala amounted to £290, there will be £90 to carry forward towards next year's Gala, which we trust may be even more successful than the former ones.

THE LATE DR. HENRY BENNET.

We greatly regret to have to announce the death of this gentleman on the 26th ult., at La Bollène, Alpes Maritimes, France, aged seventy-five.

Dr. Bennet was born in Manchester in 1816, but was almost as much of a Frenchman as he was English. His medical education was completed and extended in the Paris hospitals, and he graduated in that city, both in arts and in medicine. He speedily acquired a great reputation as a specialist in London practice, but after some years symptoms of approaching phthisis induced him to winter in a more genial climate, and after some time he settled down for the winter months at Mentone, practising his profession and obtaining fame once more in another department of medicine from that with which his name was at first associated. In this way he brought the Riviera in general, and Mentone in particular, into note as a winter residence for invalids, and so far as any one man could do it, Dr. Bennet may be said to have been the founder of Mentone. He found it an obscure hamlet—he leaves it the resort of thousands of invalids from all countries, with all the luxuries and appliances suited to their condition. In the summer

months Dr. Bennet, until a few years back, resumed his practice in London, filling up the interval between leaving the one city and establishing himself in the other, by visits to all parts of the Mediterranean region. Dr. Bennet, as is natural in so accomplished a physician, was an acute observer, and he was one of the first who, in studying the peculiarities of different climates from his special point of view, recognised the great importance of noting the general character of the vegetation, its periodicity, and the course of its growth. Botany and horticulture were taken as his guides, because "they are the surest, the least capable of deceiving." The interest he felt in these observations was happily reflected in the letters he contributed to these columns—letters which, to a large extent, formed the basis of his delightful book, *Winter and Spring on the Shores of the Mediterranean*.

At Mentone, too, he established on the rocky hillside a series of terrace gardens where both soil and water were at first deficient, and where the sun flames upon the bare rock with an intensity of which we, in this country, can form little idea. These do not seem very favourable conditions for gardening, but Dr. Bennet overcame them. The scanty soil was supplemented by supplies obtained from the crevasses of the rocks and elsewhere; water-courses were diverted, underground irrigation practised, and reservoirs established, so that before long Dr. Bennet's garden became for its extent one of the most remarkable anywhere in Provence. A full account was given in our columns in 1868, and illustrations of them were given in our number for October 3, 1874, since which time, we believe, many extensions and improvements have been made. At Weybridge, where he also for a time resided during the summer under very different conditions, Dr. Bennet pursued his experiments and observations, in so doing affording another illustration of the evils likely to arise from that unholy divorce between medicine and botany which has been forced upon the authorities of late years. This, too, has been effected at the very time when botanical training has become of the foremost importance in unravelling the phenomena connected with the causation of disease!

Dr. Bennet, from his experience and varied attainments, was a delightful companion, as many former members of the Horticultural Club will remember, and his loss will be severely felt, by those who were privileged to be reckoned among his friends.

THE FATHER OF HORTICULTURE IN ITALY.

The following extracts, relating to General Ricasoli, have been obligingly furnished by Cav. E. Fenzi:—The announcement of the sudden death of General Vincenzo Ricasoli deeply grieved all his townsmen, and especially us, his colleagues, and the echo of the mournful tidings has reverberated, not only in all parts of our peninsula, but also in the most distant lands, inasmuch as in every corner of the earth, botanists and amateurs of plants derived satisfaction from keeping up continual correspondence with him respecting the studies which were dear to him from his earliest youth.

Passionately fond in early life of all natural sciences, and especially so of botany, he became acquainted with some of the most noted scientists of every country, and studied and apprehended the climatological and vegetative conditions throughout Italy. But even at that early period of his study of botany and of the laws that regulate the development of vegetable life he was principally devoted to the introduction and cultivation of plants, useful and ornamental, of distant countries. Often have I heard him enumerate amongst the most dear memories of his young days, the new plants placed by Baring in the garden of Rusciano, and more especially the first *Chrysanthemums*, which were admired in bloom towards the year 1835, if my memory does not deceive me.

The military service, which took him as a volunteer to the fields of Lombardy in 1848-49, and later on with the high-famed General Lamarmora to Sardinia and Crimea, was powerless to detach him from the studies of his predilection, as is clearly proved by the letters that he was then addressing to his brother Bettino Ricasoli, who shared his tastes. The extensive plantations of every kind undertaken at Brolio and on the heights of Pratomagao, and still more than these, the very rich collection of *Cocifers* placed in the garden of Pellegrino, remain as living memorials of their common predilection. It was the exclusive work of Vincenzo to write a most accurate monograph of such collection, which he published in 1874, at the time when the first International Exhibition of Horticulture took place in Florence.

The traveller coming from Rome, weary after passing through the deserted Maremma and the unhealthy jungle of the Alberese, fixes his gaze when nearing Grosseto, with satisfaction and admiration on an extensive plain, cultivated to perfection, where, at equal intervals, arise spacious and comfortable dwellings, each of which bears the name of one of the most glorious feats of arms of our national Epopee, thus showing that the agriculturist had not forgotten that he, too, had been a soldier in the battles of Italy's independence. This property is Gorarella, the past history of which, and its present state, deserves now a visit from all those who are aware that agriculture is the chief source of riches in Italy.

It was here that the first agricultural machinery was introduced into the Maremma, and Gorarella in a short space of time became the model farm of that region. Not satisfied with the results obtained, he set to work to form a colony in the plains of Grosseto, and succeeded in his endeavour. It was a true battle, fought to the very knife, not only on account of the malaria, but against the prejudices and difficulties that assailed him on all sides, but his determination and perseverance triumphed over all, and now numerous families live there in a prosperous state.

The interesting memoir which he published several years ago on the introduction of the Mezzeria system in Gorarella, with accurate statistics, and an account of all the trials and sacrifices made by him, not empirically, but based on science, remains a lesson of inestimable value.

Persuaded that in the culture of the Vine lay the principal resource of agricultural production in Tuscany, and emulating what his brother Bettino was carrying out in the landed property annexed to the castle of Brolio, he covered with extensive vineyards the slopes of Monte Argentario, and with judicious choice in the Vines, and even more judicious methods of making the wine, he succeeded in rendering acceptable as table wine, not only here, but also in countries far removed, a product which, until then, scarcely obtained any sale whatever, on account of the rough mode of preparing it. It was at Monte Argentario that our friend centred his care and studies during the last twenty years of his most active life, dedicating them entirely to the advancement of science and horticulture. Those who had the good fortune to visit this garden of Casa Bianca well know that the descriptions respecting it have always fallen short respecting it.

For twenty years down to our present time he cultivated this enchanting spot, not limiting his attention to placing each plant appropriately with the care used in a school of botany, but studying, one by one, the requirements of each species, so as to obtain the best conditions suited for their development, multiplying them and comparing them, so as to unravel the intricate synonymy arising, often from ignorance, and at times even from fraud. The mildness of the climate, and protection from some of the winds, are the natural advantages that he found at Casa Bianca. But what is the reverse of the medal? A stony soil, entirely averse to cultivation, an absolute lack of water, and a want of men to execute the necessary works!

And yet those who now visit those woods of trees

and plants from every temperate region of the globe, and see the life-giving water emerging in abundance wherever required, can realise the immense difficulties that have had to be overcome.

In 1876, under the modest title of "Eight Years' Experience in Plants on Monte Argentario," he consented to publish in the then incipient *Bullettino* (monthly record) of the Tuscan Society of Horticulture, a description and summary of the attempts made, and of the results obtained. Later on, in 1888, and always in the same practical and modest style, which was naturally his own, he published, under the title, "Respecting the Utility of Gardens of Acclimatation, and of the Naturalisation of Plants—Experiments made in the garden of Casa Bianca, near Port' Ercole," a report which he had but a few months ago enriched with a supplement, offering an account of the successive introductions and experiments.

The number of species now experimented upon at Casa Bianca is above 2000: the genus *Eucalyptus* comprises 114 species; *Acacia*, 190; the Palms and Cycads above 200 varieties or forms. Each species of plants, after it has bloomed, has been scrupulously studied, and its proper place assigned to it, and in every case a record of the degree of resistance to cold and drought, as also the greater or lesser aptitude of its spontaneous dissemination, has been made.

To the mind that reflects on this task, it must appear almost impossible how a private gentleman could possibly do so much, and so well. He was one of the first founders of the Tuscan Horticultural Society thirty-six years ago, and sat constantly in its councils, always willingly offering his helping hand on every occasion.

When, in 1876, the *Bullettino* was started, he became one of its most ardent co-workers. All the volumes are full of his articles, and besides his memoir, already mentioned, his translations of Mr. Baker's monograph on *Agaves* and *Yuccas* are particularly noteworthy, on account of the original observations he therein introduces. To him it is also due if the *Bullettino* has been enriched with chromos of new and noticeable plants, which has greatly contributed to its justly obtaining much appreciation, even in foreign countries, amongst similar publications.

CULTURAL NOTES.

HERBACEOUS CALCEOLARIAS.

When we consider the beauty of the *Calceolaria*, one wonders that they are not more commonly grown; but probably this arises from the difficulty many appear to think there is in raising and cultivating them, which is an erroneous notion, as in reality they are not difficult but easy of management, although they do require some amount of care and attention. This is chiefly needed at the first, and during the early stages of the life of the plant, but anyone who will carry out the following instructions need not fail. The first, put good drainage into a large shallow pan, and over the crocks put some moss or rough siftings of soil, filling up to within half an inch of the rim with finely-sifted light rich mould, which should be pressed quite firm and made smooth. The next thing to do is to sprinkle it with water so as to wet without washing the soil, and after the soil has stood and drained an hour or so, the seed may be sown by scattering it very evenly and thickly over, but it must not be covered beyond having the faintest sprinkling of silver-sand, as the seed is so small, and would never get through. The seed having been sown in the way referred to, it should be covered with a piece of clean glass and placed beneath a hand-light, stood in some damp and shady spot, and there kept close till germination takes place, which under such favourable conditions it will speedily do. The piece of glass should be removed as soon as the seedlings appear, and these bedewed daily with a fine-rose can or the syringe.

As soon as the plants can be handled, they should be pricked out into pots or pans similarly prepared as those for sowing the seed, giving them an inch or so between, which will afford space enough for them till they have to be potted off singly. The soil most suitable for this purpose is a mixture of friable loam, leaf-mould, and rotten cow-manure, in the proportion of two-thirds of the first-named, and equal quantities of the latter, with just a little sand to keep the whole open. For the first potting, 60 sized or 3-inch pots are quite big enough, and as the plants are very soft and tender, they must be handled carefully, or much harm will follow. After the potting the best place for hybrid *Calceolarias* is an ordinary garden frame, stood on a coal-ash bottom in some naturally shaded spot, as then there is no risk from attendants not protecting them from sun when needed, and sudden outbursts of that luminary or exposure to it for only a short time may be fatal. *J. Sheppard*. [Our correspondent then alludes to cultural details to pursue at a later period, which we shall print at a more fitting time. Ed.]

PODOCARPUS NUBIGENA.

This is a species introduced from Valdivia by Mr. W. Lobb through Messrs. Veitch, and long ago described by Lindley in Paxton's *Flower Garden*, 1851, ii. 162,

FIG. 23.—PODOCARPUS NUBIGENA. SHOWING MALE CATKINS. Separate anther magn. 20 diam., pollen grains magn. 240 diam.

f. 218, and in the *Journal of the Horticultural Society of London*, vi. 264. Subsequent writers have acknowledged the species, but added little or nothing to its history, so that it is not necessary to cite them in this place. Mr. Acton, however, has enabled us to fill up a gap in our knowledge, by sending us from his garden near Dublin, specimens showing the male flowers, which are in linear oblong catkins, half to 1 inch long, clustered at the ends of the branches. Each anther is prolonged into a deltoid, irregularly toothed crest, and the pollen has the winged character characteristic of *Podocarpus*, and which allies the genus, otherwise so different, to the *Abietinæ* (*Pinus*, &c.).

The leaf-structure shows an epiderm, a hypodermal layer, transfusion cells in the centre, elongated transversely and void of chlorophyll, and a central undivided vascular bundle. The structure is thus the same as in *P. chilensis*, and many others of the

genus. There are no stomata on the upper surface, but a broad band of them on either side of the mid-rib on the lower surface, marked by the presence of a layer of bloom.

Although the species inhabits Valdivia, the Andes of Chile and Patagonia at the snow line, it is not hardy enough to be depended on in this country. Carrière notes that in cultivation, when grown on its own roots, it grows with difficulty, but when grafted on *Podocarpus Totara*, it grows so vigorously as to be recognised with difficulty. *M. T. M.*

MESSRS. CARTER'S CROSS-BRED WHEAT, &c.

On the occasion of the usual inspection before harvest of Messrs. Carter's cross-bred Wheats, at their nurseries at Forest Hill, we had to regret the absence of Mr. Sharman through temporary indisposition. Mr. Bard, his efficient substitute, an expert in fertilising, must have found it a great satisfaction to be able to announce the cross-breeding of Barley. Hitherto, no one has introduced to agriculture, in this country, cross-bred varieties of that important cereal. Mr. T. Horsford, Charlotte, Vermont, U.S., claimed to have crossed Barley, as the following quotation from a letter to the writer, shows:—"In the summer of 1881 I crossed our common six-rowed Barley, which is the same as that which the French call *Escourgeon*, with the Nepal Barley, which is beardless and hull-less." He adds that the heads of the offspring were much longer than either parent, beardless but not hull-less, and they showed great vigour. The improvement of a cereal implies its adaptability for a particular soil and climate, and a good sort for America—where Barley is a far less important crop than in this country—might not answer in England. At any rate Messrs. Carter have taken a new departure so far as this hemisphere is concerned, and all who are interested in John Barleycorn will desire their success. The result of crossing the long-eared Golden Melon Barley with the thick-set Goldthorpe, is that most of the ears of the offspring are thickset like the male parent, and more so than in the case of the offspring of a reversed cross when Goldthorpe was the female parent. An ear of this thick-set cross, taken at random, was found to contain 39 grains.

The cross-bred wheat has tried the patience of the raisers in a way which all cross fertilisers of plants and animals alike will understand. Mr. H. Vilmoria says of the cross-bred varieties of wheat he has been engaged upon since 1873: "Four or five years' selection were necessary, on an average, to make each sort tolerably even and fixed." Messrs. Carter have found that each sort produces several types and many varieties, differing more or less widely in character. We feel sure they have acted wisely in not having continued the work of crossing, since they have enough to do in selecting and fixing the best types among the crosses of former years. We have seen with pleasure that several of their varieties, including Earliest of All and Hundredfold, have won high praise among growers in different districts, and that a large farmer in Essex has sold all the seed he could spare of his growing crop of the early sort at a price which shows the high appreciation of his neighbours. Among the new varieties now being tested at Forest Hill many might be named and their parentage described. We must avoid these details, and can only add that various sorts have been produced suited to all soils—strong and straw producing, or otherwise, and that excellence in regard to weight and quality have been secured by using the best varieties as parents.

Two new Peas were pointed out to us in the trial grounds—one a giant 7½ feet high, a great cropper, owing the name of Giant Scimitar; the other a dwarf, 2 feet high, loaded with large pods and named "Daisy." The fashion certainly runs in favour of Peas with comparatively short haulm, and, if "Daisy" does not disappoint present expectations, it will take rank with Messrs. Carter's former introductions, Telephone and Stratagem. The pods are

well filled, and the pea is as large, and is believed to be as productive as any of the Marrowfat family. The flavour, too, is, we are told, superior even to that of the favourites just named. *H. E.*

HOME CORRESPONDENCE.

CLEMATIS MONTANA.—This is an old inhabitant of our gardens, a native of the South of Europe which blooms in May—that is, earlier than any other Clematis that I am acquainted with. We have some plants of it here covering parts of the front of the Abbey of Forde, and extending many yards. It was this year covered with its white blooms, which are of the size of a five-shilling piece. It blooms on the shoots which are more than one year old, and every year we prune it back to its allotted space on the wall. After flowering is over, the growth is allowed to extend as will, hanging down the walls, and making quite a pretty feature. This species of Clematis is not fastidious as to soil; here its roots are under some large paving-stones, and get no water, except what percolates through the joints of the slabs. *Pro.*

MELONS, ETC., AT WOKINGHAM, BERKS.—There can be no doubt of the popularity of the Melon at the present day; the frequent exhibition of this delicious fruit, the production of new varieties—some good, some bad—and its extensive use in private establishments, amply denote the fact. The market men, too, would seem to be alive to its capabilities, judging by the extensive culture of the fruit at Stanley Vineries, Wokingham; the establishment of Mr. G. F. Pontin. Recently he had, in three houses, each 100 feet in length, about 600 fruits hanging, varying in weight from 3 to 10 lb., and many measuring 26 inches in circumference. The time that elapses from the date of sowing the seed to cutting the fruit, say, is three months and one week. There were observed a score of Melons whose aggregate weight would be 200 lb., and hundreds ranged from 4 to 8 lb. each. The varieties grown are Conqueror, Golden Perfection, Scarlet Invincible, Sutton's Triumph (the latter a fine novelty); Imperial Green, and two others not named which are exceptionally good in shape, colour, and netting also. One named Pontin's Model will, doubtless, be heard more of. It is a cross between Triumph and Scarlet Invincible, of good habit, and a free setter. There were about 400 plants just up for the batch that will fruit in September; and Mr. Pontin hopes to do this season what he has accomplished for many years, viz., cut over a thousand Melons in one year. The fruits are grown on banks simply thrown up as the soil was met with. Mr. Pontin has grown Melons in soil that was nearly all clay, and in others that consisted mostly of gravel, with about equal results! He allows two stems to each plant. Attention is not confined to Melons alone. There are three other houses, each 100 feet in length, which contained French Beans; others contained 1200 Tomato plants in good bearing. *B.*

GLADIOLUS IN ROSE BEDS.—One of the best ways of showing the blooms of Gladiolus in the garden is to plant the corms in the beds of Rose-bushes, as when the first flush of flowers of the Roses is over, the blooms of the Gladiolus are appearing. The beds of Tea Roses are those most suitable for planting with Gladiolus, their growth being not so strong as that of H. P.'s; and their dwarfier forms afford an excellent groundwork for the Gladiolus. I am this year trying the Lemoinei section, and intend leaving them to winter where they are planted, as they are said to be quite hardy; but whether that is so or not, they are a fine race of Gladioli, and quite apart from the other species. I think it will be found that they will be much grown for cut blooms. The soil that the Gladiolus likes is a moderately light sandy loam that has been deeply dug; which is also what the Tea Rose requires. Both Gladiolus and Roses are the better for annual dressings of rotten manure. *J. S.*

CELERY.—Celery has been having a fine time of it lately, as rains have been frequent and the weather cool, and they took very quickly to the soil after planting and are now growing apace. This will soon induce some to follow the old-fashioned system of earthing-up or beginning that process, which, in my opinion, is the greatest mistake possible in the management of Celery, as when fresh soil is

put in about it no one can water the plants, however careful he may be, without washing some of the earth down into the hearts and thus in a measure spoiling the plants. The very best thing that can be done for Celery at this season, or before, is to mulch the rows, seaweed being most valuable for the purpose, as the plants like a little saline matter, and the seaweed is inimical to slugs and insects, and by lying light and close keeps the ground under it constantly moist, thus benefiting the roots and accelerating the growth of the plants. Old Mushroom bed material is also a good mulching for Celery, and when the rows have either the one or the other, the watering can be carried out rapidly, and what is so afforded, benefits the plants and is not absorbed by the dry air. The finest Celery we ever had was treated as mentioned last year, which was watered with water with common salt and nitrate of soda dissolved in it. These were in the proportion of one tablespoon of each to four gallons of water, and with a view to test and see its effects thoroughly and distinctly we only applied it to about two-thirds of each row, and the benefit to those portions was plain and unmistakable, as might readily be seen, even on a cursory look, so free and fine were the plants and so fresh and green in their colour. This season I shall treat them similarly, but shall add some soot to the other ingredients. I opine that the Celery maggot and other insects will not like it, but when Celery is affected by the first-named, he is pretty safe between the tissues of the leaves, and can only be got rid of by squeezing between the finger and thumb. As yet, however, I have seen no maggots, and the leaves of the Celery plants show none. *J. Sheppard.*

TO KEEP POTATOS YOUNG AND FRESH.—My employer tells me that some one told him that if young Potatoes are dug up and put into tin boxes, and these buried four feet deep in the earth, the tubers will keep sound and good, and come out like new Potatoes at Christmas or any other time. I have never heard of it before. I should like to hear if any of my brother gardeners have tried it. *H. G. B.*

THE GARDENS, BRAMBLETYE.—This is one of the finest gardens in this part of Sussex, and under the careful supervision of Mr. G. F. Glen, everything is well managed. Looking through the houses recently, I noticed capital bunches of Muscat Grapes, and splendid crops of Peaches, Nectarines, Figs, &c. —in fact, such crops and quality could not well be surpassed. In the kitchen garden Apples and Plums seem to be well furnished with fruit, Pears not so plentiful, but bush fruits are an abundant crop. Just before leaving the kitchen garden to enter the pleasure-grounds, and in a nice sheltered corner a well-arranged piece of subtropical bedding has been carried out, the background being trees. Groups of Palms, Dracenas, Abutilons, Solanums, &c., look well with a kind of parterre planted around them with variegated Alyssum, amongst which are dotted plants of Lobelia cardinalis. At an opposite corner there is the best bed of the Double White East Lothian Stock which I ever remember seeing. Planted amongst these are Gladiolus—scarlet, no doubt; and when these are in bloom overhead the effect will be good. Mr. Glen is certainly fortunate in possessing a splendid new Lobelia, one of his own raising. The colour and bloom is far ahead of anything now in commerce, and it will prove a gem for bedding and growing in pots. *Visitor.*

FASCIATED LILY STEMS.—Herewith I beg to send you a photograph of two *Lilium auratum*, both from Mr. L. Boehmer's Lily fields here. The bulbs of both are about the same size, about 11 inches in circumference, but the large normal one has only 22 flowers and buds, while the other one has 113 flowers and buds. The flowers of the later one are of course not so big as the normal one, but only two-thirds of the size. The stem measured before parting about 3 inches, and is broad-like pressed together. Plants with so many flowers are scarce here too, but stems with 30 and 40 flowers are sometimes found. *A. Unger, Yokohama, Japan.* [We have seen as many as 200 flowers on one stem. *Ed.*]

NOVELTIES AT BELGROVE, IRELAND.—The Mexican Calochortus (*C. madrensis*) figured in last year's *Gardeners' Chronicle*, is now nicely in flower in an open bed in my garden, and is an exceedingly bright and pretty species, and apparently quite hardy, also very free flowering. It seems to be intermediate in size between the Calochorti and Cyclobothra, and is, I think, well worth growing; it is later in blooming than any other of the species

known to me save *C. Weedii*, which will not open till to-morrow or next day. *Amaryllis Hallii*, a hardy *Amaryllis* from North China, said to have blue flowers, is now on the point of blooming for me for the first time, and in appearance of head exactly resembles one of the Nerines. Mr. Baker says it is only a garden name, and thinks that it will probably turn out to be member of the Lycoris family. In colour, as far as I can judge of it at present, it will not be blue, but deep red shaded with purple. *Senecio compacta*, one of the shrubby New Zealand Groundsels, is now blooming with me, I believe for the first time in Europe; only four buds on one branchlet of a strong, good-sized bushlet. When they open, if fair to see, I might send you one for figuring. *W. E. Gumbleton.*

THE CATANANCHES.—I think two more useful plants for cutting from, and especially for use in floral decorations, can scarcely be found than *Catananche coerulea*, and its white variety, bicolor. It is so long since the sky-blue *Catananche* was introduced from Southern Europe, that the fact it is largely a neglected plant is not to be wondered at. The white form (*C. bicolor*) is a garden variety, raised, it is thought, nearly three-quarters of a century ago, but both well deserve a place in the garden. They are herbaceous perennials, and do well in a light soil in a warm position; the flowers are not too large, lasting, and are plentifully borne upon tall, erect stems, and if cut when little more than half expanded, tied together in bunches, and hung in a cool, dry place, with the flower-heads downwards, they become to a considerable extent everlasting in character, and are useful in winter when flowers are scarce. The flowers of *C. coerulea* are pale sky-blue, those of bicolor greyish-white, with a delicate tint of blue. As the plant seeds freely, I would advise growers to raise a few seedlings once in two years, and so keep up a succession of young vigorous plants. Both come true from seeds. I recently saw some epergnes in which the pale form of *C. bicolor* had been employed with excellent effect. *R. D.*

WHAT IS A SEEDLING? (*see ante*, p. 136).—Among florists a seedling is a flower that has not yet received a distinctive name. The term is not so readily understood now as it was twenty or thirty years ago. Then a florist would raise from seed, say, a number of Tulips, Auriculas, Pansies, Hollyhocks, Chrysanthemums, &c., and any of superior quality he would mark as seedling 1, 2, 3, and so on, or employ in place of figures the letters of the alphabet. He would then submit his seedlings when in flower to some competent tribunal or authority, and if a favourable opinion were passed, he would name and send out such as it seemed desirable to select for the purpose. Once named, the flower ceased to be a seedling in the ordinary acceptance of the term. This was the practice in the days of the old National Floricultural Society. It is still the practice at the meetings of the Floral Committee of the Royal Horticultural Society, and at the exhibitions held by the florists' societies up and down the country. And it is an almost invariable rule not to make an award to a seedling, however high its quality, until it has had a varietal name bestowed upon it. This practice is very generally understood, and works on the whole smoothly and satisfactorily. The main reason why a name is given, is to distinguish it, and assist in its identification hereafter. Of late years the practice of naming the varieties of certain popular flowers has practically ceased—I may mention *Antirrhinum*, *Cinerarias*, *Calceolarias*, *Gloxinias*, &c., and is followed only in the rare cases of something of exceptional merit. I am well aware that this statement of practice does not meet the objection that a plant raised from seed is a seedling so long as it exists as an individual, but as the term seedling is employed more particularly to plants exhibited for money prizes, or for some other distinguishing award, such as a Certificate, whether the foliage, fruit, or a blossom be the main feature it is desired should be recognised, I think its application is generally and widely understood. *R. D.*

COLUMBINES.—In reference to the robustness of cross-bred Columbines, "J. S." may be assured that any two species which are hybridised invariably give stouter constitutional progeny than do any one pure species. Still farther, they make first-rate perennials, and if the ground be good, or the plants occasionally assisted with manure, will endure for many years. Much depends upon cultivation, and few hardy plants pay better for good culture than do Columbines. Really attractive forms are not

limited to species, or hybrids of species. Many of the garden varieties are exceedingly beautiful, bloom invariably earlier than do the species, are remarkably robust, seed abundantly, and give a wealth of flowers admirably suited for ordinary house-decoration. There is not much art in crossing Columbine flowers, but it is well to remove the pollen-cases or anthers from the flowers to be cross-fertilised early. I have not found it needful to protect the fertilised flowers from insects, and have invariably found that the produce was just what the nature of the cross led me to anticipate. Some of the garden varieties will cross admirably with the species. *Chrysantha* is, perhaps, one of the very best seed parents, because of its robust habit; but I have always found crossed seedlings from it to be much stouter, and to bloom more profusely. *Chrysantha* and *cærulea*, and the latter and *californica*, give capital results. Anyone having these forms can make the crossing experiments for themselves. As seed ripens early, that is, during July, the product may be sown at once, and although there will be no bloom the first year, there will be a fine show of bloom the following year, when the true character of the seedlings will be evidenced. The long spurs of *Chrysantha*, *cærulea*, and others, form one of the great charms of their flowers. Happily, intercrossing these varieties does not in any way destroy that admirable feature—indeed, I think, rather helps to develop it. Intercrossing with garden forms helps to produce some odd or absolutely spurless flowers, bearing resemblance to small *Clematis* flowers; these are, however, exceptions. On the whole, we have in the Columbine one of the prettiest of hardy garden flowers, but still one far too seldom found in gardens. *A. D.*

BASAL ROT IN DAFFODILS.—Now that the season for planting *Daffodils* is commencing, may I be allowed to call the attention of planters to the "basal rot," which is a cause of serious losses and failure in many gardens. I refer to a morbid condition of the bulb, under which little or no new root is formed, and though the leaves and flowers may become partly developed, the bulb of necessity perishes. Different experts in plant diseases, to whom I have several times submitted affected bulbs at various seasons, have all assured me that no specific cause of disease can be detected. I conclude that the failure is due to impaired constitution, arising from unsuitable cultural conditions. The affection is almost entirely confined to Trumpet *Daffodils*, and different varieties suffer in different soils, making it probable that it is due to the presence or absence of some character in the soil suited or unsuited to the particular variety which suffers in each case. Ard Righ and the White Trumpets suffer most in my garden, and I am making experiments with lime, bone, sulphate of copper, and sulphate of iron, each by itself. If others would make similar experiments, we might in time learn how to improve the constitution of the affected varieties, and so save them from perishing as they now do. *C. W. Dod, Edge Hall, Malpas.*

GRAPES SCALDING AND CRACKING.—In the opening remarks of "S." on Grapes scalding and cracking, he endeavours to show that I attributed the first-mentioned malady entirely to want of ventilation, which is quite contrary to what I intended or wrote, and it is a well-known fact the sun will and does scald when the berries are exposed to its direct rays, and especially if it strikes them directly under the Vines through the end glass of a house the first thing in the morning, when the berries are cold. This, it appears, "S." has only recently found out, as he mentions that in spite of all precautions he has for years been troubled with scalding, and yet, according to his own showing, he has only recently adopted the simple remedy of shading, which, he says, has cured the evil. *J. Sheppard.*

MALFORMED BEGONIAS.—Some curiosities have appeared amongst a few *Begonias* to which it is my duty to attend. On one of the plants, which is a strong growing but rather poor variety, a few hermaphrodite flowers have appeared, which have, like the majority of male flowers, four perianth leaves, and a truly superior fully developed ovary, on which the wings are partly suppressed, and a small portion of the placenta covered with naked ovules protruding between the stigmas. At the base of the ovary a few fertile stamens of about normal size have also appeared, therefore I have a true hermaphrodite flower, which, however, is no improvement in beauty on the normal type; another plant, a yellow variety of sturdy habit with rather small flowers, which produced none but staminate

flowers for a long time, and but rarely a pistillate flower even now, is perhaps the most curious. The perianth leaves have been curiously marked by ridges with many points protruding down the middle of them, and in some cases naked ovules have been produced on the perianth leaves themselves. I at first thought them to be cells, but I find they are much too large, being about the size of unfertilised ovules. There does not appear to be any trace of a stigma. The stamens are not so numerous as ordinarily, and have shorter filaments, and the anthers are rather deficient in pollen. Flowers in which the placenta are protruding seem to be getting too common to attract very much notice. *W. L.* [Changes such as are above described, and of which our correspondent has obligingly sent specimens, are now commonly met with. Many such cases have been figured and described in these pages. The ridges on the perianth segments are new to us however: we suspect they may be attempts to form placentas. *Ed.*]

FRUITS IN MID-KENT.—It is not often that we have to record success with all kinds of fruits, but this year all are fruiting well, with the exception of Black Currants, which are the least satisfactory around this district, although in these gardens there is plenty. Prices, too, are fairly good, the jam factories that are springing up in all directions doing much good in preventing a glut in the markets; the trees, too, are very clean, and but little caterpillar or aphid visible on them. Where the thickly-set fruits were thinned early in the season, the trees are promising well for next year too—that is, if we get a fine bright autumn to ripen the wood. The prospects of fruit growers look brighter than for some years past, thanks to the lateness of the season, which was, no doubt, productive of fruitfulness, there being a chance of the trees when in bloom escaping injury from late spring frosts. *A. Waterman, Preston Hall Gardens, Aylesford.*

CEDRUS DEODARA.—Two trees here of this Himalayan Conifer are this season bearing a good crop of Cones. This is the first time that I have noticed cones on the *Deodar*. The majority of Conifers are producing but few cones this year, probably owing to the dull wet summer of last year, and the cold spring. Notable exceptions are *Abies cephalonica* and the Lebanon Cedars. *C. Herrin, Dropmore.*

CHERRY BIGARREAU DE SCHREKEN.—This fine black Cherry is well deserving of a place in every collection, especially where earliness is valued. Last year we planted some strong maiden trees on the open wall, and these produced a few fine fruits, which were ripe the second week in June, and almost all other fruits are quite a fortnight later than usual in ripening this year. It promises to be quite an acquisition as an early dessert Cherry. *C. H.*

PHORMIUM TENAX (p. 137)—I am surprised at the account of the flowering of the *Phormium*. Surely it has flowered in many places [yes, but not at Worthing]. Here I have had it in flower more than once, and one year I had good seed on it; but the last winter cut nearly all my plants to the ground. The one that stood the winter best was *P. Cookii*. *Rev. Canon Ellacombe, Bitton Vicarage.*

—This plant is perfectly hardy in the south-west of Scotland, even at some miles from the sea. It flowered here on several plants last year, one had twelve flower-stalks, the seed from which has germinated. There are no flowers this year. *Munches, Dalbeattie.*

—Supplementing the remarks on this subject at p. 137, I may say that *Phormium tenax* and several of its variegated forms have flowered in the large conservatory at the Pine-apple Nursery, Maida Vale, London, now in the hands of Messrs. Hooper & Co. [under glass]. At the present time in the rockery there, there is a fine spike of flowers and fruits on a specimen of *Vitch's* variegated form of this plant. In pots it is not an easy plant to flower, but planted out under glass it only requires to grow the plant to sufficient strength to get it to flower. *J. O'B.*

INDIA.

TEA AND COFFEE SUBSTITUTES.

I HAVE read with interest the series of notes on "Tea and Coffee Substitutes" that have appeared in your journal, and I might add to the information by

mentioning two plants which have been omitted from your list, but which are used in India. The first of these is the *Eugenia caryophylla*, used in the Mysore territory for the manufacture of tea by the natives. The tree resembles the Jambul (*E. jambolana*), and the young leaves are picked, allowed to wither, rolled and fired, as in the manufacture of black tea. The prepared leaf is then boiled when required for use, and the liquor, mixed with a little sugar, is taken as a beverage, and considered by some to be more pleasant than tea. Some leaves prepared in this manner were recently sent me for an opinion as to their properties if taken in large quantities. The leaves were found to contain small quantities of tannic and gallic acids and a volatile oil, but no stimulating constituent, as the alkaloid theine.

The other tree from which tea has been made on the Nilgiri Hills is the *Gordonia obtusa*. The leaves very much resemble those of the Tea, and like them contain a tannic acid and an alkaloid. In the case of young leaves manufactured into tea, it would be difficult, if not impossible, to distinguish between them and the genuine tea from the *Camellia theifera*. *D. Hooper, The Laboratory, Ootacamund.*

SOCIETIES.

SOUTHAMPTON.

SATURDAY AND MONDAY, August 1 and 3.—In some respects this exhibition was far ahead of any of its predecessors, notably in the miscellaneous group class, which showed a distinct advance. None of the exhibits in this section of the schedule showed any of that close packing of plants which is so objectionable and so often seen, but in its place there was a happy freedom displayed. There may have been a slight falling off in the quality of some of the specimen plants exhibited in the minor classes, but there still remained abundance in the more prominent ones to make a splendid exhibition even in that department.

Groups of Miscellaneous Plants, arranged for effect, to occupy a space of 120 square feet, brought out seven competitors, and as they were all arranged in the centre of one tent there was a good opportunity to examine them. Mr. E. Wills, florist, Winchester Road, Shirley, was an excellent 1st; this group was remarkable for that grace and freedom so much appreciated in groups of this character, not a plant was there but what could be seen. The groundwork was a mass of Maidenhair Fern, from which arose graceful Palms, Orchids, Crotons, and a quantity of *Francoa ramosa* which gave a lightness to the whole. 2nd, Mr. E. Carr, gr. to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, an admirable arrangement also, in which was displayed many choice Orchids.

Stove and Greenhouse Plants.—The principal class was that for twelve, half to be in bloom and the remainder foliage. Five competed. Mr. Jennings, gr. to W. Garton, Esq., Roselands, Woolston, Southampton, no doubt surprised himself in his maiden effort by beating that veteran, Mr. Cypher. In the collection was a magnificent plant of *Allamanda Hendersoni*, which had fully 300 expanded blooms; to this was awarded the Silver Medal offered by the proprietors of the *Gardeners' Magazine* for the most meritorious exhibit in the whole show; a very fine *Stephanotis floribunda*, a good *Croton angustifolius*, and a huge *Latania borbonica* were his chief plants. Mr. Cypher, Cheltenham, was 2nd, he having an exceedingly fine *Phænocoma prolifera Barnesii*, *Allamanda grandiflora*, and *Ixora Pilgrimii*.

Ten specimens, open to gardeners only.—Mr. Blandford, gr. to Messrs. Haselfoot, Moor Hill, Bitterne, was awarded 1st honours, for a capital lot; and Mr. J. Amys, gr. to the Hon. Mrs. Elliot Yorke, Hamble Cliff, Netley, a close 2nd.

Mr. Cypher succeeded in securing the 1st in the open class for six specimens.

For six miscellaneous plants, gardeners only, Mr. Cuney was 1st.

Stove and Greenhouse Ferns were numerous staged, and in first-rate condition. Mr. Peel took leading honours, Mr. Jennings 2nd.

Orchids.—Two nice collections were staged, and being arranged on a base of small Ferns, had an attractive appearance. To Mr. Blandford premier honours went; Mr. Can 2nd.

Tuberous Begonias.—These, both double and single-flowered, were staged in large numbers, and in some

cases of exceptionally good quality. For six, Mr. H. Beny, gr. to the Rev. — Shirley, Southwick, was 1st, with a magnificent lot. Mr. Innes 1st for four.

Colcas.—Mr. Busby, gr. to F. Willan, Esq., Thornhill Park, Bitterne, was the most successful in a strong competition.

Celosias.—Mr. West, gr. to R. Wigram, Esq., Northlands, Salisbury, had much the best.

Zonal Pelargoniums.—Mr. G. Windebank, Bevois Town.

Table Plants.—Mr. J. C. Waite, gr. to Col. the Hon. — Talbot, Glenhurst, Esher, Surrey, the best in a very strong class, followed by Mr. Wills.

Cut Flowers were a prominent part of the exhibition. The premier award for twenty-four Roses went to Mr. Rumsey, Waltham Abbey, who had medium-sized fresh blooms; and Messrs. Perkins & Sons, Coventry, were 2nd. For twelve blooms, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was distinctly ahead of others, with a fine level lot; and Mr. W. Clements, Ford, Salisbury, was 2nd.

Hardy herbaceous flowers made a bright and pleasing display. Mr. M. Prichard, Southbourne Nursery, Christchurch, easily won in the twelve varieties' class, being followed by Mr. J. Evans, gr. to Lady Louisa Ashburton, Melchet Court, Romsey.

For twelve bunches of cut flowers, Mr. Evans was 1st with a good lot, in which some choice Orchids were to be seen; Mr. Wills 2nd, with good specimens of stove and greenhouse kinds. Carnations were a strong feature. For twelve, not less than six varieties, Mr. J. J. Keen, Bevois Town, Southampton, was the most successful. Mr. Clements 1st for twelve, six to be Picotees, all of yellow ground.

Table decorations were on the whole pleasing. For a table 8 feet by 4 feet, Miss Hobby, Padwell Road, Southampton, was an easy winner; Miss Ladhams, Shirley, had the best epergne decoration; Messrs. Perkins, the best bridal and ball bouquets; Messrs. Drover, nurserymen, Fareham, coming 2nd for these.

Fruit was remarkable in quantity and for its general good quality, no less than eight lots of six dishes (Pines excluded) being staged. Mr. Ingfield, gr. to Sir J. Kelk, Bart., Tedworth, Marlborough, was an easy 1st, having dishes of perfectly finished Black Hamburgh Grapes, a fine Tedworth Favourite Melon, the Warburton Admirable Peach, and Lord Napier Nectarine. For three of bunches Black Grapes, Mr. Ingfield was 1st, with excellent Black Hamburghs: Mr. T. Hall, gr. to S. Montagu, Esq., South Stoneham, was 2nd, with Madresfield Court. Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, took the highest award for three bunches of White Grapes with fine samples of Muscat of Alexandria; Mr. J. Budd, gr. to F. Dalgety, Esq., Lockerly Hall, Romsey, being placed 2nd, with the same variety. For two bunches of Black Grapes Mr. Iggulden led with Madresfield Court. Mr. J. Evans was 1st for two bunches of white, and Mr. Ingfield for single bunch of black. Mr. Ingfield also had premier bunch of White Grapes, Mr. N. Molyneux 2nd, both showing Muscat of Alexandria. The best dish of Peaches in a strong competition for the best dish were Royal George, shown by Mr. Garner, gr. to Mrs. Bradyll, Amberwood, Christchurch; Mr. Ingfield being 2nd. Mr. Ward with Pineapple in the class for one dish of Nectarines. Mr. Iggulden amongst thirteen others had the best green-fleshed Melon, having a good fruit of Eastnor Castle. Mr. Evans was 1st with Read's Hybrid in the scarlet class. Mr. Wilkins, gr. to Lady Theodora Guest, Imwood House, Henstridge, was 2nd. The best hardy fruit in six varieties was staged by Mr. West—a capital lot.

Vegetables formed a strong feature of the show, and for ten varieties Mr. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, was distinctly ahead with excellent produce in every respect. In the class for eight dishes, Mr. Ingfield was 1st.

First-class Certificates were awarded to Messrs. Keynes, Williams & Co., for Cactus Dahlias Dr. Masters, Lady Pembroke, and Baron Schroder.

NEWBURY HORTICULTURAL.

The forty-third annual exhibition of this Society took place on the 3rd inst. in the picturesque grounds of Shaw Avenue, and was in every respect a success, showing an improvement in the various departments upon previous efforts.

Plants.—Model conservatory arrangements—a commendable innovation.—In this class each com-

petitor was allowed to stage on an area of 12 feet by 8 feet plants usually found in conservatories, taste in arrangement, and quality of plants exhibited being taken into consideration. This proved to be a pretty and effective feature of the show. 1st prize, a most beautiful lot, Mr. W. Young, gr. to Captain Winthrop, Barton Court.

Six stove or greenhouse plants in bloom, 1st, Mr. F. J. Mould, Pewsey. Six variegated foliage plants, 1st, Mr. Camp.

For dinner-table plants Mr. C. Ross took the leading position with finely coloured examples. Bouquets were well and successfully shown by Mr. G. Phippen, Victoria Nursery, Reading, who was also assigned the premier place for twenty-four bunches of cut flowers for artistic arrangement. Cut Roses were shown in admirable condition by Mr. G. Cooling, Bath. For a collection of exotic Ferns, Mr. Howard, gr. to Mrs. Myers, was placed 1st with fine plants. Some finely-coloured plants in a collection of *Coleus* gained first honours for Mr. Surman, gr. to M. H. Best, Esq., Donnington Grove.

Fruit was shown somewhat largely and in excellent condition, the principal prize winners in this section being Messrs. Howard, Maher, Marsh, Ward, Lye, Ross, Young, Norris, and Surman.

The special prizes offered by Messrs. Sutton & Sons for a collection of vegetables brought out a remarkably keen competition, the produce shown being of high quality throughout. 1st, Mr. Young. A good competition also resulted for the prizes offered by Messrs. James Carter & Co. 1st, Mr. Young; 2nd, Mr. Lye.

Mr. C. Fidler's prizes for a collection of vegetables also produced a very satisfactory display, the prizes being secured by Messrs. Lye and Freeman. The cottagers' display of vegetables was an interesting and satisfactory one.

The show was admirably managed by Mr. H. S. Hanington, the Hon. Secretary.

FROME FLORAL AND HORTICULTURAL.

THIS Society held its eighth annual show on Bank Holiday, in fine weather. It was well attended, and was in every respect a success, as it deserved to be the Hon. Secretary, Mr. T. H. Woodland, and the committee being indefatigable. Mr. Iggulden, gr. to the Earl of Coik, Marston House, Frome, was the chief exhibitor, taking 1st for a group of plants, 1st for a collection of six kinds of fruit, 1st for hardy fruit, for Melons, cut flowers, and Peaches. Mr. W. Pratt, gr. to the Marquis of Bath, Longleat, staged a grand and large group of miscellaneous plants, capitally arranged; and for six splendid bunches of Muscat of Alexandria and Black Hamburgh Grapes, three bunches of each, but not for competition, they were far ahead of all other exhibits. Major Clarke showed fine hothouse Ferns. Mr. W. Stungel, gr. to — Bailey, Esq., Frome, also showed well in several classes; and Mr. Pym, Trowbridge, staged a good dish of Pine-apple Nectarine, beating Mr. W. Iggulden's fine fruits of Lord Napier variety.

WARWICK AMATEUR AND COTTAGERS' HORTICULTURAL.

THIS was the eleventh show held by the above Society, and it took place, as has been usual of late, in the beautiful grounds of Warwick Castle, whose gardens were thrown open to visitors. The entries were scarcely so numerous as last year, owing to the backwardness of the present season, but they reached nearly 1000, and the quality of the exhibits was remarkably good when it is remembered that only *bona fide* amateurs and cottagers can compete, gardeners being excluded; and that the main bulk of the produce comes out of allotment gardens, for which prizes are also offered. Then there is an industrial department also, one tent being filled with contributions of needlework from women and children, examples of domestic cookery, and also of skill by men. A great deal of interest is thus created; and the industrial department is one that it is advisable should be taken up by other societies. Contributions, not for competition, were numerous, and greatly assisted in making a display. Thus, Mr. F. Perkins, nurseryman, Regent Street, Leamington, had an excellent group of decorative flowering and foliaged plants, including some charming bouquets—one composed wholly of Princess Beatrice Sweet Pea being much admired. From Chester Messrs. Dick-

son, Limited, and from Oxford Messrs. G. Prince and J. Mattock sent excellent Roses; Messrs. Webb & Sons, seedsmen, Stourbridge, a representative collection of Peas; Mr. T. West, florist, Warwick, a collection of plants; Mr. Kitley, Castle Gardens, some plants of Maidenhair Ferns; Mr. C. Wilson, Saltisford Gardens, an excellent collection of forced and other fruits, plants, &c.; Messrs. Hewitt & Co., nurserymen, Solihull, well arranged bunches of hardy flowers, also Begonias, Gaillardias, &c.; Mr. F. Horne, florist, Warwick, a group of flowers; Mr. J. Marsh, Priory Nursery, Cucumbers, &c., all of which received certificates of merit.

During the afternoon the Earl and Countess of Warwick visited the show, and her ladyship afterwards distributed the prizes.

This exhibition is always a well managed one. Mr. Councillor J. Lloyd Evans is an excellent secretary and manager, and he is well supported by a good working committee.

NORTHAMPTON HORTICULTURAL.

AUGUST 3 & 4.—Although not favoured with the finest of weather, this show must be pronounced a great success, a quantity of good produce being brought together, whilst the attendance was all that could be desired.

Plants.—In the large plant classes there was not a great competition: the 1st prize for twelve plants, half of which were to be in flower and the rest of fine foliage, was awarded in a keen competition to Mr. Cypher, nurseryman, Cheltenham, whose flowering plants won for him his position; these consisted of two grand examples of *Ixoras*, *I. Pilgrimii* and *I. Williamsii*, both of extra size and full of flower; *Bougainvillea glabra*, very fine and fresh; *Kalosanthes coccinea superba*, highly coloured; *Allamanda Obelsoni* in excellent condition; and a good but rather small plant of *Erica Parmentieri rosea*. The foliage plants consisted, amongst others, of a fine plant of *Cordyline indivisa*, *Cycas revoluta*, an extra large *Latania borbonica*, and *Croton Sunset*, richly coloured. Mr. Finch, gr. to J. Marriot, Esq., Coventry, was a close 2nd, his foliage plants on the whole being finer than his opponents. This consisted of a huge plant in fine health of *Cycas circinalis*, two excellent *Kentias*, *Croton Martefontainensis*, in splendid colour and condition, with a good plant of *C. angustifolius*; these, with the seldom-seen *Dion edule*, completed the foliage part; three *Ericas* (*E. Irbyana* and *E. jasmiflora alba*, both being in fresh condition, but the third one was stale), a medium *Allamanda*, a small but fresh *Ixora Williamsii*, and a finely-grown plant of *Phenacoma prolifera Barnesii*, made up the collection. In a smaller class for six plants, Mr. Sainsbury, gr. to C. Watkins, Esq., Wellingborough, was 1st in this collection with a grand plant of *Zamia Vroomii*. In the class for six Ferns two excellent exhibits were presented, the 1st prize going to those shown by Mr. Holland, gr. to W. Jeffrey, Esq., Northampton; these consisted of two good *Adiantums*, two large *Gymnogrammas*, *Gleichenia Mendeli*, and another; the 2nd prize lot, from Mr. Sainsbury, consisted chiefly of *Adiantums* in good condition, with a capital plant of *Davallia fijiensis*. The groups were an improvement upon those of last year; to these a tent was specially devoted, being arranged through the centre, and facing both ways. Mr. Cypher was 1st in the open class with a very bright but light arrangement, slightly marred by four bushy *Crotons*. Had these latter been plants with one stem only, the effect would have been much better. Mr. Holland put up an excellent group in the amateurs' class, and was awarded the 1st prize. This was a worthy production, not suffering by comparison with Mr. Cypher's. Two other good groups were staged in this tent. Table plants were best shown by Mr. Treasler, gr. to M. Mansfield, Esq., M.P., Northampton, and Mr. Martin, gr. to C. W. East, Esq., Kettering, in the order named.

Cut Flowers.—These, although not numerous, were of excellent merit, more particularly the stove and greenhouse collections. The best of these in the open class was a handsome box full of choice things from Mr. Finch, consisting of Orchids, *Ixoras*, *Dipladenias*, and *Lapagerias*. In the amateurs' class Mr. Kightley, gr. to Sir H. Wake, Bt., Courteen Hall, was 1st with a very fresh collection. Mr. Cole, gr. to Earl Spencer, Althorpe, was in each instance a good 2nd. Mr. Kightley also took 1st for hardy herbaceous flowers, with such useful things as *Montbretias*, *Liliums*, and *Alstroemerias*, &c. For twenty-four cut Roses Messrs. John Perkins & Son, Market Square, Northampton, were 1st with very

fresh blooms, the best being Alfred Colomb, A. K. Williams, Dupuy Jamin, Her Majesty, Pride of Waltham, and Brightness of Chesnut, all of which had withstood the wet weather well. Messrs. Thos. Perkins & Sons, Drapery, Northampton, being an excellent 2nd. For twelve Tea-scented the competition was good, the 1st prize going to Rev. Ed. King, D.D., Gayton Rectory, being closely followed by Rev. W. H. Jackson, Bedford; the first-named exhibitor also being awarded the 1st prize for twelve of any varieties with excellent blooms. Amongst the Tea-scented, Madame Bravy, Edith Giffard, Francisca Krüger, Marie van Houtte, and Comtesse de Nadailac were noteworthy.

Table Decorations.—Mr. Cypher showed remarkably well, and was worthily awarded the 1st prize in the open class. The amateurs' class was also well filled, and showed marked improvement. Mr. Cole had the best bouquets, and won easily in each class.

Fruit.—For collections, Mr. Edmonds, gr. to the Duke of St. Albans, Bestwood Park, was 1st, with fruit of excellent quality, showing Madresfield Court and Muscat of Alexandria Grapes, a fresh Queen Pine, Elruge Nectarine, and Figs. Mr. Cole came a good 2nd, with well-finished Grapes, Peaches and Nectarines. The last named being also 1st in another class, limited to the county, taking, likewise, the Royal Horticultural Society's Silver Medal in addition to the 1st prize. Mr. Cole was the principal exhibitor in the other fruit classes, taking several 1st prizes, but was beaten, however, for Black Grapes by Mr. Miller, gr. to Sir E. G. Loder, Bart., Whittlebury, who had three grand bunches of Black Hamburgh, with extra fine well finished berries.

Vegetables.—Several classes were provided for these, in collections and individually. By far the best collection of twelve kinds came from Mr. Eyle, gr. to Lord Wantage, Overstone, which it would have been hard to beat, the best dishes being those of Major Clarke's Celery, Lockie's Perfection Cucumber, Pragnell's Exhibition Beet, White Naples Onion, Snowball Turnip, Canadian Wonder Beans, and Dwarf Champion Tomatoes. For Messrs. Sutton & Sons' prizes the best collection came from Mr. Kightley, and for those of Messrs. Thos. Perkins & Sons from Mr. Hopewell, Berry Wood, and Mr. Douglas, Wootton. The amateurs' and cottagers' classes were well filled.

SCOTTISH HORTICULTURAL ASSOCIATION.

This Society held its ordinary monthly meeting at 5, St. Andrew's Square, on the 4th inst., Mr. James Greive, Vice-President, in the chair. A paper by Mr. Melville, Dunrobin Castle Gardens, was read by the Secretary, Mr. R. Laird. The subject was "The Grouping of Hardy Plants in the Flower Garden." The paper was suggestive rather than exhaustive, leaving ample room for discussion, which was fully taken advantage of by the members present. Exhibits were of unusual interest. A very large collection of cut blooms of Roses was shown by Mr. Henderson, of Clermiston Gardens. Two 3-year old plants of Niphetos, showing extraordinary size and vigour of foliage, were shown by the same gardener; they were two of a batch of cuttings struck in August in a cold frame, and were brought up for the purpose of showing that this variety of Rose succeeds as well, if not better, on its own roots than on any other kind of stock. Mr. M. Todd, florist, exhibited flowers of Carnation White Grenadin, raised from seed. The flowers were neat, pure in colour, and in size like the well-known scarlet Grenadin. Mr. Todd, in the course of some remarks on the variety, said it began flowering with him in the beginning of July, and gave promise of continuing till the end of autumn. He regarded the variety as invaluable to gardeners and florists who had large quantities of cut flowers to produce. Mr. MacMillan, Trinity College, Edinburgh, exhibited seventeen varieties of Chrysanthemums as follows:—Sunflower, Stansted White, Edwin Molyneux, Etoile de Lyon, Mons. Freeman, Boule d'Or, Chang, H. J. Jones, Sabine, Bouquet Fait, Venus, Freney (2), Mons. H. Jacotot, Roi de Precoces, Madame des Grange, both yellow and white. Some seedling Clematis of considerable interest was exhibited by Mr. Morris of Trinity. They were the result of crosses between *C. montana* and *C. indivisa* and others, and were all meritorious; but one large white, like, but superior to, *C. Henryi*, was much admired. Messrs. Dicksons & Co. exhibited a very superior strain of Balsam, and Mr. Cranston,

Waverley House, Edinburgh, sent samples of a yellow Tomato, equal in size, and similar in form, to the "old red." It was named "The Waverley."

INSECT PESTS.

PHYLLOXERA.

The liquid bisulphide of carbon is, as is now well known, a successful remedy for the Phylloxera. We copy from the *Illustration Horticole* a statement by M. Caseneuve to the effect that, if mixed with equal quantities of vaseline, the rapidity of evaporation is checked, and that the production of Grapes is increased threefold, while the Phylloxera is destroyed. The bisulphide is rather a dangerous substance to handle, owing to the inflammability of its vapour, so that we should be glad to hear further details how the mixture above-mentioned can be made.

VARIORUM.

CACAO, COFFEE, AND COCA IN PERU.

From a recently-published report by Consal Mansfield on the Agricultural Condition of Peru, dated Lima, October 8, 1890, we learn something of the value of the above-named plants in that country.

Of Cacao, or Cocoa, as we usually call it (*Theobroma Cacao*), we are told that up to a recent date its cultivation in Peru seems to have been confined more especially to the Transandine slopes, in the province of Convencion, in the department of Cusco; not, however, in sufficient quantities to supply the markets of the southern departments of the Republic. The Cacao produced is of a superior quality, and could compete advantageously with the best descriptions raised at Soconusco and in Venezuela. The excellence of the bean is, however, rather due to the geological and topographical conditions of the Valley of Santa Ana than to the efforts of the cultivators. The Cacao goes by the name of Casco Cacao, but owing to the cost of production, distance from the sea, and deficiency of transport, cannot compete in price with that imported from Ecuador; consequently, the production and consumption does not extend beyond what is requisite for the local demand. Cacao of good quality has also always been raised in the province of Jaén, in the department of Cajamarca, and the cultivation of the plant extends towards the seaboard in the north of the department of Piura; but upon so limited a scale as scarcely to amount to more than an experiment.

With a more extended development, Cacao could easily be produced in sufficient quantities for the internal consumption of Peru, displacing export from abroad, and, perhaps, even competing in foreign markets, a future for the industry which appears more than probable, when the contemplated irrigation scheme in the department of Piura shall have been carried into effect.

With regard to Coffee, it is said no better quality is produced in the world than in Peru; more especially that raised at Chauchamayo, in the department of Janin, and in the province of Carabaya, in the department of Puno. The production amply suffices for the internal consumption, notwithstanding that the latter has much increased during the last few years. Small quantities, during several years, have been exported to Europe, which, on account of the quality, found favour in the market, and fetched good prices, with the result that foreigners are beginning to settle in Peru as Coffee planters upon quite a considerable scale. The coast valleys, as well as those in the Transandine districts, furnish a favourable field for the plantations. The amount of the present production is not estimated. In 1888, 27,107 kilos. were exported from Callao, and 25,650 kilos. were imported from Guayaquil through the same port.

The Coca plant (*Erythroxylon Coca*) so well known for its anæsthetic and medicinal properties, is indigenous in Peru, and is largely consumed by

the Indians in the Republic, where it is cultivated for exportation. No other country, indeed, competes with Peru in the quantity exported. Two establishments exist for preparing the leaf—one in Lima, and one in Callao. During the last year, 1730 kilos. of Cocaine were exported to Europe, principally for Germany. No statistical data are forthcoming concerning the amount of production, but in the year 1888, 28,660 kilos. were exported through the port of Callao.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 1, is furnished from the Meteorological Office:—

"The weather has remained in a very changeable and inclement state, especially over England, where frequent thunderstorms have occurred, with heavy local falls of rain.

"The temperature has been below the mean in all districts. In the western and northern parts of the Kingdom the deficit has not amounted to more than 2° or 3°, but in 'England, S.' it has been as much as 5°, while in 'England, E.' it has reached 6°. The highest readings were observed on July 26, excepting in the north of Scotland, where they occurred during the latter part of the week; in Ireland, the north of Scotland, and the north-west of England the thermometer did not reach 70°, but in the Channel Islands it rose to 75°, while in 'England, S.' and 'England, S.W.' it reached 78°. During the middle of the week the maximum readings were below 60° over a considerable portion of the United Kingdom. The lowest readings occurred mainly between the 28th and 30th, when the thermometer fell to between 40° and 45° in nearly all parts of Great Britain. In Ireland, however, the absolute minima varied between 46° and 48°, while in the Channel Islands the thermometer did not fall below 51°.

"The rainfall has been considerably more than the mean in the eastern and southern parts of England, and slightly more in 'Scotland, N.' and 'England, N.E.', but less in all other districts, excepting the Midland Counties, where the normal was just reached.

"The bright sunshine has been less than the mean in all districts, excepting 'Scotland, W.' and 'England, S.W.'...

MARKETS.

COVENT GARDEN, August 6.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday...

MARKET well supplied, and quotations the same as last week. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arum Lilies, Asters, Carnations, etc.) and prices in s.d. and s.s.d. units.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots (Aralia Sieboldii, Aspidistra, etc.) and their prices.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits (Apples, Cherries, Currants, etc.) and their prices.

NOTE.—Bananas and Apricots differ in price so greatly, according to quality and quantity on sale...

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing various vegetables (Artichokes, Beans, Beet, Carrots, etc.) and their retail prices.

POTATOS.—Very heavy supplies coming to hand, consequently prices very much lower—65s. to 80s. Beauties and Roses; 95s. to 110s. Kidneys. J. B. Thomas.

HAY.

Averages.—The following are the averages of the prices paid at the various metropolitan markets during the past week...

SEEDS.

LONDON, Aug. 5. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report today's market of quite a holiday character...

FRUITS AND VEGETABLES.

BOROUGH: Aug. 1.—Quotations:—Cabbages, 2s. to 3s. per tally; Turnips, 2s. to 3s. per dozen bunches...

SPITALFIELDS: Aug. 4.—Quotations:—Vegetable Marrows, 1s. 6d. to 2s. per dozen; Cabbages, 2s. to 4s. 6d. per tally; Scarlet Beans, 5s. 6d. to 6s. 6d. per bushel...

STRATFORD: August 5.—Cabbages, 3s. to 4s. 6d. per tally; Carrots, household, 1s. 6d. to 2s. 6d. per dozen bunches...

POTATOS.

BOROUGH: Aug. 4.—Quotations:—Jerseys, 100s. to 120s.; Cherbours, 70s. to 100s.; Kent and Essex Regents, 8 s. to 90s.;

STRATFORD: Aug 5.—Quotations:—Kidneys, 80s. to 100s.; Hebrons, 60s. to 80s.; white do., 80s. to 95s.;

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Aug. 1, and for the corresponding period last year:—1891, Wheat, 38s. 9d.;

NOTICES TO CORRESPONDENTS.

BLACK GRAPES NEVER COLOURING WELL: Acor. This may be due in your case to something in the soil that is inimical to the Vines...

FUNGUS IN PASTURE: F. Townsend. Nylaria polymorpha, Grev., common, growing from wood decaying in the ground.—M. Cooke.

GROOM-GARDENER: H. A. A. Such a practitioner might reasonably be allowed to exhibit in a Cottage Garden Society's show...

NAMES OF FRUITS: E. S. The Myrobalan Plum, used for stocks; the fruit is also good for preserving.

NAMES OF PLANTS: Blue Bell. Campanula latifolia.—J. P. & S. Centaurea suaveolens, Sweet Sultan.—G. L. 1, Cephalotaxia pedunculata var. fastigiata...

insect puncture.—W. G. Calceolaria pinnata.—G. S. 1, Veratrum nigrum; 2, Campanula trachelium multiplex; 3, Pteris longifolia; 4, Chelone (Pentstemon) barbatus...

NIPHĒTOS: Rose. The name is probably from the Greek Niphotos, signifying drifted snow; the e in the second syllable should be pronounced short.

NYMPHĒA ALBA: F. L. Judging from your statement, we are decidedly of opinion that the judges were in error in disqualifying the bouquet on the grounds that the common white Water Lily is not a native...

SCORCHED FOLIAGE OF VINES. B. The trellis to which the Vines are secured being too close to the glass, it would be advisable to stretch some wide-meshed hexagon netting over that part of the roof...

SITUATION IN AMERICA: Young Gardener. You should get a situation in a nursery in Canada or the States. There is not much chance of your hearing of a vacancy on this side of the Atlantic...

THE TREATMENT OF ORCHIDS: C. B. I. Odontoglossum Edwardii does best in the cold-house all the year round. Winter, 50° to 55° by day, 45° at night; summer, 60° to 70° by day, 55° at night...

TUBEROUS ROOTED BEGONIAS: A. M. The cuttings root the most certainly when a thin heel of the flesh of the tuber is taken off with them...

TWIN CUCUMBERS: W. H. L. Not so rare as you suppose. It is a freak of nature, induced usually by the excessive vigour of the plants...

FARMS, ESTATES, RESIDENCES.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS, on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The *Midland Counties Herald* always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is
THE "WORCESTER HERALD,"

ESTABLISHED 1794.
The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."
Sales of Stock and Agricultural Effects.
The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.
Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.
For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.
SPECIMEN FREE. Price 2d.
Published Friday for Saturday.

GARDENING APPOINTMENTS.

Mr. HENRY CHURCH, for the past 12 months foreman at Carpenter's Park Gardens, Watford, as gardener to H. Bacon, Esq., Raveningham Hall, Norwich.

Mr. J. W. SPARROW, formerly at Cromer Hall, as Head Gardener to T. H. HARRISON, Esq., Briarwood, Martlesham, Woodbridge, Suffolk.

Mr. FOWELL, formerly Head Gardener to the late RICHARD BARGE, Esq., Gaywood Hall, King's Lynn, Norfolk, as Gardener to HENRY DE STAFFORD O'BRIEN, Esq., Blatherwycke Park, Wansford, Northamptonshire.

REQUIRED, a HEAD WORKING FRUIT GARDENER, all round, for Market. Well used to Winter Forcing. State age, family, time of service, and wages, to C. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD WORKING GARDENER, of experience. Two under him, with extra help when required. Must have an interest in his job.—Apply, Mr. HADFIELD, Monaston, Ross, Herefordshire.

WANTED, a thoroughly practical GARDENER, married; Wife to keep Lodge and Gate.—Apply, stating wages, to W. W. H., Oaken Holt, Botley, near Oxford.

WANTED, a SECOND GARDENER and WIFE, good Laundress.—Address, with full particulars, Mr. CRAMOND, Knolly Gardens, Salisbury.

WANTED, a steady, persevering young MAN, as UNDER GARDENER. Must have a good knowledge of Inside and Outside Work.—W. HUNTER, Aston Hall, Rotherham.

WANTED, September 2, an UNDER GARDENER. Some knowledge of Fruit Growing indispensable. Bothy and vegetables when to spare.—Apply, by letter only, stating age, wages required, and particulars of experience, to HEAD GARDENER, Alderarc Hall, Notts.

WANTED, a strong, active young MAN, as UNDER GARDENER, in a Gentleman's Garden. Wages, 18s. per week.—Apply, with references, to WILLIAM FISHER, Nurserymen, Barton-on-Trent.

WANTED, a strong, active single MAN, for Kitchen Garden work; 15s. a week and bothy. Also a strong active LAD, from 17 to 18, for general Garden work; wages, 12s. and bothy. Must be Roman Catholics.—Apply to the GARDENER, Frensham Place, Farnham, Surrey.

WANTED, for the end of August, a single young MAN, about 25 years of age, to look after the Garden, assist on the Farm, and make himself generally useful about a Public Institution. Must be of unexceptional character. Wages, £5 a year, with board and lodging.—Apply to the GOVERNOR, Industrial School, Lostock, near Bolton.

WANTED, a FOREMAN, Catholic preferred, for the Houses. State age, wages, with bothy, experience, and references, to W. CONNELLY, Rhode Hill Gardens, Lyme Regis, Dorset.

WANTED, as PROPAGATOR, an active and painstaking young man.—State wages, age, and experience, by letter only, to Messrs. JOHN LAING AND SONS, Forest Hill Nurseries, London, S.E.

WANTED, a PROPAGATOR of HARDY PLANTS under Glass.—Must have had experience in Roses, Clematis, and Conifers. The propagation of tender plants will be in another department.—WM. PAUL AND SON, Waltham Cross.

WANTED, a CARNATION GROWER.—Apply to JOSEPH LOWE, Uxbridge.

WANTED, AT ONCE, for a few weeks, several good and quick ROSE BUDDEERS.—State wages required, to S. G. RUMSEY, Rose Grower, Wrotham, Kent.

WANTED IMMEDIATELY, as ROSE BUDDER, a good hand, for a short time, or permanently, my Foreman being ill.—T. BUNYARD, Ashford, Kent.

WANTED, a First-rate JOURNEYMAN, for Winter Garden, Fernery, &c., active, industrious, and at least experienced in two good situations. Age not under 21 years.—Apply to GEO. ABBEY, Avery Hill, Eltham, Kent.

WANTED, in a Garden near London, an active young MAN as FIRST JOURNEYMAN, to take charge of Plant Houses, to grow Palms, and other Decorative plants, and plants for cutting purposes. Must be experienced in the making up of Cut Flowers and Table Decorations. Must be well recommended. Wages 15s. Bothy.—Apply to A. T. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

WANTED, AT ONCE, a young MAN, to raise and set plants at a small place, all glass.—Reply, stating full particulars, wages required, &c., to J. R. BAXTER, 31, Oxford Street, Manchester.

WANTED AT ONCE, a steady active young MAN, well up in Potting, Watering, and General Nursery Work. Wages, 18s. Good character required.—LANE AND MARTIN, 227, Brixton Road, S.W.

WANTED, a young MAN who has some knowledge of Grafting and Growing Clematis, Roses, &c., under the Propagator.—F. STREET, Heatherside Nurseries, Camberley, Surrey.

WANTED, a young MAN, age about 21, for the Houses, under Foreman. One who has had some experience in Orchard Houses. Wages, 6s. per week, with Bothy.—C. HILL, Woburn House Gardens, near Maidenhead, Berks.

WANTED, MAN and WIFE, no encumbrance. Man as Gardener; Peaches, Grapes, &c. Wife as Laundress. Wages, 30s. per week, with cottage and vegetables free.—J. G., 41, Wellington Street, Strand, W.C.

Seed and Florist Trade.
WANTED, a JUNIOR SHOPMAN, with knowledge of Wreath-making, Plants, &c. State salary required.—PRITCHARD AND SONS, Shrewsbury.

WANTED, a SHOPMAN, to Manage a Florist's Shop. Must be well up in Wreaths, Crosses, Buttonholes, Bouquets, &c. None but those of good character and experience need apply.—Address, with full particulars, MANAGER, Redland's Nursery, Emsworth.

WANTED, as STOKER, a steady married MAN, without family, and to make himself useful in the Nursery. Preference given to one who can Paint Greenhouses. Situation permanent to steady man. Wages, 20s. per week, with cottage, fire, and light.—State full particulars to TURNER BROS., Florists and Nurserymen, Garston, Liverpool.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

GARDENER, or GARDEN MANAGER.—A first-class Horticulturist and Estate Manager requires a re-engagement. Accustomed to Grow for Market, and to Sell Surplus Produce. Highest and unexceptional references. Salary, or salary and commission.—MANAGER, W. K. Woodcock, Barkby Road Nurseries, Syston, near Leicester.

GARDENER (HEAD), where two or three are kept; age 38, married, small family.—A Gentleman desires to recommend his gardener as above.—WM. NUNN, Woodville, Palatine Road, Withington, Manchester.

GARDENER (HEAD).—Age 43; thoroughly efficient in all branches. Left through death.—F. SMALL, 9, Rochford's Cottages, Turford, Broxbourne, Herts.

GARDENER (HEAD), in a good Establishment.—Age 35, married; thoroughly experienced in all branches; understands Land and Stock. Four years' good character from last situation.—C. RITCHINGS, 1, Wandle Road, Hackbridge, near Carshalton, Surrey.

£15 will be paid to anyone furnishing the Advertiser with information of any Gardening changes that will lead to obtaining an engagement as HEAD GARDENER in a good establishment. Highest references from previous employers.—HORTUS, Messrs. Brown, Gould & Co., 51, New Oxford Street, W.C.

GARDENER (HEAD); age 36.—ROBERT NELSON, Hwlth House, Ravenstonedale, is desirous of a situation as above. Could leave by giving one month's notice. Excellent testimonials.

GARDENER (HEAD), Scotch.—No children; thirteen years in last place; well up in all branches; Fruit growing indoors and out a speciality; good references.—WM. CHISHOLM, Senr., Oxon Hoth Park, Tonbridge, Kent.

GARDENER (HEAD).—Age 31; thoroughly practical, Inside and Out.—J. CHEAL AND SONS, Nurserymen, Crawley, Sussex.

GARDENER (HEAD).—J. W. SILVER can with the utmost confidence recommend an exceptionally high-class man, as above; of long experience in Fruit and Plant-growing, and the general management of a large establishment. The highest references as to both character and ability.—Streatham and Norbury Nurseries, London, S.W.

GARDENER (HEAD), where one or two are kept.—Age 29, married; sixteen years' experience in all branches. Abstainer.—H. H., Crockham Hill, Edenbridge, Kent.

GARDENER (HEAD WORKING), where three or four are kept; age 31, married when suited.—Mr. DAVIES will be pleased to recommend his Fruit Foreman to any Lady or Gentleman that requires the services of a good practical man. Has been under him for the last eight years.—H. GLASSCOCK, The Gardens, Mate Park, Maidstone, Kent.

GARDENER (HEAD); age 41.—Experienced in all branches, including early and late Forcing and management of good establishment. Five years' recommendation.—F. W., 13, Castle Street, Hertford.

GARDENER (HEAD WORKING).—Age 39, married; total abstainer. Advertiser would be glad to hear from any Lady or Gentleman who grows, and has good conveniences for growing, the following:—Grapes, Peaches, Nectarines, Figs, Melons, Cucumbers, Tomatoes, Mushrooms, Stove and Greenhouse Plants, Ferns, Orchids, Roses, Chrysanthemums, also Flower and Kitchen Gardens, and Early and Late Forcing. Twenty-three years' practical experience. Highest references for abilities and character.—**GARDENER**, Oakwood, Chichester, Sussex.

GARDENER (HEAD WORKING OF GOOD SINGLE-HANDED).—Age 32, married; seventeen years thorough experience. Four years' character from last situation.—A. G., 2, Lime Tree Cottages, Lower Mitcham, Surrey.

GARDENER (HEAD WORKING); age 32; married, no family; thoroughly experienced in all branches of the profession.—A GENTLEMAN highly recommends the advertiser. Five and a half years' character.—F. W., 29, David's Road, Forest Hill, S.E.

GARDENER (HEAD WORKING).—Age 36, married, no family; nineteen years' thoroughly good practical all-round experience in all branches, in late and out, good testimonials.—J. BARKER, Elgin Terrace, Maida Vale, London, W.

GARDENER (HEAD WORKING), where more are kept.—Age 33, married, no family; experienced in all branches. Good character.—H. C., 15, Victoria Road, Ringlefield Green, Surrey.

GARDENER (HEAD WORKING).—Age 38, married; thorough in all branches, Orchids, &c.; Land and Stock, if required. Highly recommended.—J. P. L. LINGER, Cavendish Road, St. Albans.

GARDENER (HEAD WORKING), where several are kept.—Age 28, unmarried; fourteen years' first-class all-round experience in good establishments. Excellent references as to ability and trustworthiness.—C. JONES, Gardener to the Rev. C. J. Sale, Holt Rectory, Worcester.

GARDENER (HEAD WORKING, Scotch), where two or more are kept.—Age 29, unmarried; his experience.—R. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING), where five or six are kept.—Excellent experience and references; abstainer.—**GARDENER**, 29, Stadium Street, Ashburnham Road, Chelsea, S.W.

GARDENER (HEAD OF GOOD SINGLE-HANDED).—Age 36, married; six years in Duke of Bedford's Gardens, three in present situation. Good characters from 10 h.—W. H. KEEN, Berry End, Eversholt, Woburn, Beds.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 37, married; thoroughly practical in every branch of the profession. Six years' good character.—J. ARNOLD, Cote-bach, Lutterworth.

GARDENER (SINGLE-HANDED, or otherwise).—Age 32, single; well up in Growing Tomatoes, and the general routine of Flower and Kitchen Gardening. Eight years' good character.—A. M., Ruscombe, near Reading, Berks.

GARDENER (SINGLE-HANDED).—Age 26; single; nearly two years in last situation; good references; total abstainer.—H. W., The Poplars, Brook Lane, Cheshunt, Herts.

TO NURSERYMEN.—Age 26; eight years' experience. Growing for London Market and Shop Trade. Has had charge of Houses.—C., 138, Park Road, Kilburn, London, N.W.

SHOPMAN.—Seventeen years' experience in Seeds and Bulbs. Excellent references.—P. S., Box 67, Post Office, Preston, Lancashire.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, East Grinstead, Sussex.

To Nurserymen.

NURSERY CLERK, thoroughly competent (age 32), seeks situation; proficient bookkeeper, Correspondent, &c.; long experience, highest references.—"DELTA," *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS.—Experienced young Lady seeks re-engagement. Thoroughly good at making up Bouquets, Wreaths, Sprays, Button Holes, &c. London experience. Highest references.—**EDWARDS**, W. Buxey, Bridge Street, Southampton.

HOLLOWAYS OINTMENT and PILLS.—With the changing season it is prudent for all to rectify any ailment afflicting them; but it is incumbent on the aged, suffering under ulcerations and similar debilitating causes, to have them removed, or worse consequences will follow. This Ointment is their remedy; on its powers all may confidently rely; it not simply puts their sores out of sight, but extirpates the source of mischief, extracts the corroding poison, and stimulates Nature to fill up the ulcer with sound, healthy granulations that will abide through life. Under this treatment bad legs soon become sound, scrofulic taints cast off their scales, and scrofulous sores cease to annoy. Such hope for the disease was unknown in former days.

**HILL & SMITH'S
BLACK VARNISH**
for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost. Used in all London Parks, at Windsor, and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer.

Price 1s. 6d. per gallon at the manufactory, or carriage paid to any railway station, 1s. 8d. per gallon in casks of 36, 18, or 9 gallons.

CAUTION.—Every Cask bears the above Registered Trade Mark. Beware of cheap imitations.

SALES BY AUCTION.

Monday and Thursday Next.

DUTCH BULBS. SPECIAL TRADE SALES.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION** at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **MONDAY, August 17, THURSDAY, August 20, MONDAY, August 24, and THURSDAY, August 27**, large consignments of named Hyacinths, Tulips, Crocus, Narcissus, and other Dutch Bulbs, together with white Roman Hyacinths and Paper White Narcissus, received direct for unreserved sale. These early auctions have been specially arranged in lots to suit the trade, and other large buyers. The Auctioneers will be pleased to enter the names of intending purchasers in their permanent lists, who may desire a regular supply of catalogues for these sales. Auction Rooms and Offices, 67 and 68, Cheapside, London, E.C.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their **SALE ON FRIDAY NEXT, August 21**, a few **ESTABLISHED ORCHIDS**, comprising fine plants of **CYPRIPEDIUM DOMINIANUM, C. ROTHSCHILDIANUM, LYCASTE SKINNERI ALBA**, and several others, for unreserved Sale.

On view morning of Sale, and catalogues had.

Friday Next.

ANSELLIA AFRICANA NILOTICA.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION**, by order of Mr. F. Sander, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT, August 21**, at half-past 12 o'clock, an importation of the rare and beautiful

ANSELLIA AFRICANA NILOTICA,

in first-rate condition, and in compact and well-shaped pieces. Nicholson, in his *Dictionary of Gardening*, speaks of it "as much superior to the type . . . the colour of the flowers brighter and more distinctly defined; sepals and petals, too, are more spreading."

A plant or two of this lovely Orchid should be added to every collection.

CATELEYA LARIATA GASKELLIANA?

An importation in excellent condition. Plants are healthy, strong, and well leaved. Collected far away from the Gaskelliana region, and thus promising a crop of novelties in both form and variety.

A **NEW CYMBIDIUM**.—Flowers white, with crimson stripes.
An importation of **CYPRIPEDIUM**, var. of **INSIGNE**, from Cachar.

ANGRECEM RILORUM.—A charming species, of easy growth; flowers ivory-white, with rose flush at tips of sepals and petals. Semi-established plants, growing freely.
CALANTHE PLEIOCHROMA.

"**VIRIDI-FUSCA**.—Extremely rare. A most interesting plant. Flowers green and brown.
CYPRIPEDIUMS BOXALLI and **VENUSTUM**.

And many other choice, interesting, and valuable species.
N.B.—There will be included in this Sale a very fine plant of **MASDEVALLIA VEITCHII GRANDIFLORA**.

Acton, W.

Priority Nursery, Acton Lane. Proprietor, Mr. J. C. Jennings. To **NURSEYMEN, GENTLEMEN, and OTHERS**. The **SECOND ANNUAL SALE of 20,000 SURPLUS STOCK of PLANTS**.

MESSRS. W. EYDMANN AND SON have received instructions from the Proprietor to **SELL BY PUBLIC AUCTION**, on the above Premises, on **THURSDAY, August 27, 1891**, at 1 for 2 o'clock, the **SURPLUS STOCK of STOVE and GREENHOUSE PLANTS**, consisting of Maiden-hair and other Ferns, Encliaris, Azaleas, Cyperus, Carnations of sorts, Chrysanthemums, Poinsettias, Roses in pots, Double Primulas, Pelargoniums, Marguerites, large Euphodia splendens, specimen Lappula alba, Orchids, Agapanthus, Lithiums, &c. Useful Florist's Van.

May be viewed day prior to Sale. Catalogues to be obtained on the Premises, and at the Auctioneers' and Valuers' Offices, High Street, Acton.

N.B.—Immediately upon the conclusion of the Sale of Surplus Stock, the **FREEHOLD NURSERY** will be submitted for **SALE BY PUBLIC AUCTION**, on the Premises, containing a total area of over 3 acres, with the following erections thereon:—28 well-built Greenhouses, with the following erections thereon:—45,000 feet of glass and woodwork; 3,000 feet of hot-water piping, driven by 14 boilers; Stabling for 4 Horses, 2 Coach-houses, Potting, Packing Sheds, &c.

Thursday Next.

SPECIAL SALE OF ORCHIDS in FLOWER and BUD.

MR. J. C. STEVENS will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **THURSDAY NEXT, August 20**, at half-past 12 o'clock precisely, a **COLLECTION of ORCHIDS in FLOWER and BUD**, comprising many fine forms and specimens; also 2000 splendid Bulbs of **LILIUM HARRISII**, just received from America, for early forcing, &c.

On view morning of Sale, and Catalogues had.

Pendell Court, Bletchingley, Surrey.

MR. J. C. STEVENS has received instructions from the executors of the late Sir G. MACLEAY to **SELL BY AUCTION** on the premises, as above, on **WEDNESDAY and THURSDAY, September 2 and 3**, at 1 o'clock precisely each day, the **COLLECTION of ORCHIDS** comprising exhibition specimens of **Cypridediums, Cologynes, Sobradias, Vanillas, and Cymbidiums**; also **Cattleyas, Odontoglossums, Dendrobies, &c.**, including most of the well-known kinds. Specimen Palms, Tree and other Ferns, Aquatic Plants; Ornamental Stove, Foliage, and Greenhouse Plants; Succulents, Lilies, Eucharis, &c. Also Three Cows, Horse, and Pony, Two Carts, Two Bicks of Hay, Iron Tanks, Garden-seats, Vases, Lawn-mowers, Greenhouses, Water-barrows, and other requisites for the Garden.

On view the day prior, 10 till 5, and mornings of Sale; and catalogues had on the Premises, and of the Auctioneer, Offices and Rooms, 38, King Street, Covent Garden, W.C.

Wednesday and Saturday next.

EXTENSIVE IMPORTATIONS of BULBS from HOLLAND, SPECIALLY LOTTED for the TRADE and LARGE BUYERS.

MR. J. C. STEVENS begs to announce that his **FIRST SALES of the SEASON of DUTCH BULBS** will take place at his Great Rooms, 38, King Street, Covent Garden, on **WEDNESDAY and SATURDAY NEXT, August 19 and 22**, at half-past 12 o'clock precisely each day, and will comprise choice named **HYACINTHS, TULIPS, CROCUSES, NARCISSUS, IRIS, COLCHICUMS, &c.**, just received, 5000 **LILIUM HARRISII, PAPER WHITE NARCISSUS, DOUBLE and SINGLE SNOWDROPS**, for forcing, &c., specially lotted for the Trade and other buyers.

On view morning of Sale, and Catalogues had.

WANTED TO RENT, a SMALL NURSERY, with DWELLING-HOUSE. All in good order. Apply, **W. BRUNSWICK**, Chancery Passage Nursery, Law, S.E.

WANTED, TO RENT, a SMALL NURSERY.

DISSOLUTION OF PARTNERSHIP.

FOR IMMEDIATE DISPOSAL.

The Well-known and Successful

SEED AND BULB BUSINESS

Carried on during the past ten years, by

DOBIE & MASON,

66, DEANSGATE, and 22, OAK STREET, MANCHESTER.

To Principals every facility for investigation will be given.

A Genuine Compulsory Sacrifice.

FLORIST, SEEDSMAN, and JOBBING BUSINESS for IMMEDIATE DISPOSAL, in a London suburb, within 25 minutes' drive of Covent Garden, doing a good trade, with plenty of scope for increasing same. Handsome Shop, with Dwelling house and small Nursery.

Price £250, IF SOLD AT ONCE.

Honestly worth £500, but Owner is compelled to give up, owing to private circumstances, which will be satisfactorily explained. Price includes Stock in shop and houses, nearly new Florist Van, Horse, 6 Greenhouses, well heated; Shop-furniture, Counters, Tools, Barrows—in fact, everything.

Every investigation courted. The goods on the place alone are worth more than the price asked.
Address, **FLORAL HALL, Gardeners' Chronicle Office**, 41, Wellington Street, Strand, W.C.

YORKSHIRE (on the borders of), an excellent **FREEHOLD NURSERY** FOR SALE, the owners retiring from business. A compact Nursery, all under Glass. Six Greenhouses, nearly new; dwelling house and buildings. Also Leasehold Nursery, nearly 3 acres.
Full particulars of Messrs. **PROTHEROE AND MORRIS**, 67 and 68, Cheapside, E.C.

To Small Florists, Jobbing Gardeners, &c.

FOR SALE, the SIXTY YEARS' LEASE of a place; five Greenhouses. Price very low.
Enquire, 59, Nightingale Road, Wood Green.

FOR SALE, the twelve years' LEASE of a NURSERY (2 acres), seven Glass-houses, all heated. Within 10 miles of Covent Garden, and close to two stations.
Apply, **F. H., 5, Gladstone Villas, Fairfield Road, Edmonton, Middlesex.**

FOR SALE, a COMPACT NURSERY, six Greenhouses, 210 feet run of Glass, and a Frame of twenty lights, with good Frontage to Main Road, and close to Station. Houses heated with hot-water, with Shed and Office. All standing on half an acre of Land.
Apply to **WM. COPE**, Ann's Villa, Stanley Road, South Woodford, Essex.

FOR SALE, GARDENERS' and FLORISTS' BUSINESS, in the best part of St. John's Wood and Hampstead; established thirty years; splendid connection. Price, for Goodwill, Lea, and Buildings, £500; Stock at Valuation. Reason for disposal, old age.
Apply, **CLEAVE**, 3, Quex Road, Kilburn, N.W.

Fruiterer's, Florist's, Seedsman.

FOR SALE, West Suburb of London, eight miles out. Average turnover, £2000 a year, which could be easily increased. Unique position. Any energetic man with £1000 at command should see this.—**FRUIT, Gardeners' Chronicle Office**, 41, Wellington Street, Strand, W.C.

To Gardeners.

FOR SALE, the GOODWILL of a good **JOBBING CONNECTION**, West London, for valuation only; about £70. Piece of Ground to carry on same, rent free.—Apply to **JOBBER, Gardeners' Chronicle Office**, 41, Wellington Street, Strand, W.C.

SEED DRAWERS.—A grand Nest. Have only been used one season. Containing 185 dust and mouse-proof Drawers, with 6 large Bird Seed Bins, oak-grained, nicely labelled; cost £45. No reasonable offer refused. Specially suited for a First-class Retail Counter Trade, or Large Market Gardening Business.

ZFNIA, *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

TO BE SOLD, a Bargain (through a death), the **LEASE** of a capital **MARKET NURSERY**, 8 miles from Covent Garden, with eleven good Glasshouses, all exceptionally well heated; also 200 good Pit-lights and Fixtures. Capital Stabling and Dwelling-house, with every convenience. Rent only £25 per annum; price low to an immediate purchaser. Apply to—

J. S., 2, Elm Villa, Town Road, Lower Edmonton, N.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 15, 1891.

WELBECK ABBEY GARDENS.

A VERY pleasant way to approach these gardens, which ought to be seen by everyone interested in scientific horticulture, is from Creswell station. About midway the road winds through Creswell Crags, a ravine cut in the magnesian limestone by the river Wollen. The steep sides of the cliff are overhung by Ivy, and venturous trees find a lodgment even in the most inaccessible parts. The caves here, locally yept Robin Hood's Cave and Mother Grundy's Parlour, have yielded the bones of man mingled with those of the mammoth and the arctic fox, thus proving the existence of man in the Neolithic age. Reaching the brow of the hill above the ravine, the range of the extensive buildings at Welbeck comes into view, just like a little town.

It is simply impossible to give an adequate idea of the immense garden under Mr. Horton's charge, unless one proceeds on a definite method. We will take as centre of operations his cottage, which faces south. On either side is a large conservatory, and then comes a range of lean-to vineries 80 yards 2 feet in length. In front of all this are several acres of cultivated ground, and then another wall, by the side of which is planted, on arched iron-work, an arcade of fruit trees—Pears on one side and Apples on the other—24½ yards long, which, when in flower, offer a most dazzling spectacle. On the north side of this wall, Currants and Gooseberries, which hang very late, are planted, and the south is taken up by a Peach-case the whole length of the wall. Then comes another wide piece of ground, chiefly laid out in squares, and devoted to bush trees, bounded on the other side by a third long wall, on the south side of which is an Apricot-case 385 yards long. In front of this is a long strip of ground, formerly laid out for Strawberries, the beds being arranged so that they could be covered by glass, but now devoted to other purposes. The garden on the north side is bounded by the famous tan gallop, which is covered in with glass, and between it and the main range of vineries are arranged all the pits, frames, propagating-houses, and span-roofed greenhouses for cut-flowers. Below the main range of vineries are two ranges of span-roofed plant-houses, each 98 yards long, and each divided into three parts; and another wall the same length covered by glass. Enormous as these figures are, they comprise only a part of the glass on the estate, as my readers will see later on.

We will start our walk through the houses from the conservatory on the left as you enter Mr. Horton's cottage. This is a tropical house, the floor of which has been lowered in order that the Bananas may be planted-out and grow to their full height. They fruit abundantly, as do the Guava and the Cape Gooseberry. I did not envy Mr. Horton the trouble and the sleepless

PARK, ROCKWORTH, & ESTATE PLANTING.
OVER 100 ACRES OF NURSERY.

SEEDLING PLANTS

OF CHOICE

Florists' Flowers.

We have much pleasure in offering the following in Strong, Healthy, Transplanted Young Stuff, from our superb strains.

	Free by Post, at prices quoted.	Per doz. s. d.
Auriculas, Alpine, very choice strong young plants, for blooming next season	...	2 6
Calceolarias, herbaceous, splendid strain	...	2 6
Carnations and Picotees, from choicest named flowers	per 100, 10s. 6d.,	1 6
Cinerarias, large-flowered, very fine, per 100, 10s. 6d.,	...	1 6
Hollyhocks, choicest double	...	6 for 2s., 3 6
Primulas, Alba magnifica, Splendid Pure White	...	3 6
“Crimson King, deep Crimson, magnificent colour	...	6 for 2s., 3 6
“Choicest Red, White, or Mixed, per 100, 10s. 6d.	...	1 6
Hyacinths, Early White Roman, fine selected bulbs	per 100, 10s. 6d.,	1 6
Narcissus, paper White	...	7s. 6d., 1 0
“New large-flowered	...	10s. 6d., 1 6
“Double Romae	...	7s. 6d., 1 0
Lilium Harrisii, fine bulbs	...	56s. 0d., 7 6
“Extra fine	...	80s. 0d., 10 6

Primulas, double Pure White, splendid for furnishing an abundance of Cut Flowers throughout the Autumn and Winter. Well-rooted, strong young plants, from 3-inch pots. Per 100, 42s.; per dozen, 6s.; 3 for 1s. 9d.

Our Fine Illustrated CATALOGUE of DUTCH and other FLOWER ROOTS, NEW and CHOICE ROSES, FRUIT TREES, &c., should be read by all intending purchasers before Ordering. Post-free, 3d., or Gratis to Customers.

DANIELS' BROS.,
TOWN CLOSE NURSERIES, NORWICH.

nights he must have had during the late severe winter in keeping the frost out of such a lofty house. The range of vineries, which comes next, could not well be improved upon, either as regards heating or ventilation, the arrangement for the latter being very easy to manipulate. Young Vines are being gradually put in to replace the old, as the houses are so numerous, this can be done a house at a time. All the roots are inside, and the borders are formed by degrees, as the roots come up to the soil already put in position. A very rich turfy loam is procured from the park, in which the young Vines are making really astonishing growth. The borders are 3 feet deep, resting on a rubble composed of 2 feet of whole bricks. The soil is so good that not much artificial feeding is required, which perhaps is the reason why Madresfield Court finishes so well. Besides the usual sorts, White and Black Tokay and Barbarossa are extensively grown, and the late variety Welbeck Seedling, however it may do elsewhere, certainly is a great success in its native habitat. It is of good flavour, keeps well, and is much thinner in the skin than Lady Downe's. The foliage also is strikingly distinct from any other Grape. Although there is so much ground, nothing is wasted at Welbeck. The back wall, and the border in front of it, are utilised for growing Tomatos and salad plants. The popular variety of Tomato seems to be Ham Green.

It is convenient now to take the two long ranges of plant-houses. They are fully 30 feet wide, which allows for a large stage in the middle. The first house was filled with flowers for cutting. Carnations are grown by the thousand, and there were also any number of Gladiolus The Bride, Richardias, Liliun Harrisii, and Freesias, F. Leichtlinii being the most grown. The next house was a stove, in which was a magnificent collection of Crotons Queen Victoria; C. angustifolius and Prince of Wales were represented by very large-sized plants. Striking varieties are undulatus, which has hardly two leaves alike; interruptus aureus, and majesticus. There was also a large number of plants of a nice size for decorative purposes. Dracaenas, Dieffenbachias, and Screw Pines, which are allowed to acquire a lovely pink flush by being put close to the glass, are also extensively grown. The most extraordinary plant in the house is, however, an Anthurium Veitchii. It can hardly be matched for size anywhere in England; many of the leaves were more than a yard long. The third house is intermediate, and is devoted to Coleus, Acalyphas, Gardenias, planted out Cliveias, Amaryllis, including Her Majesty and a number of seedlings; Clerodendron fallax, and Palms for decoration, such as Cocos Weddelliana and Geonoma gracilis. On the roof in the stove was Allamanda Hendersoni, and in the intermediate-house a Bougainvillea. Every plant was so free from insects, that I could not refrain from asking the insecticide used; it is Bentley's. The first house in the corresponding range was a forcing vegetable house, in which the French Beans were planted out, and not grown in pots. At one end was a mass of white Lilac, which had been in flower since Christmas, the shrubs having been lifted from the shrubbery, and brought there and planted out. Strawberries, of which 10,000 are forced, were also fruiting profusely; the old varieties Keen's and La Grosse Sucrée being the most used. The next house was devoted to Figs, the entire roof being thickly covered with the Brown Turkey. At the time of my visit, in the middle of April, they were gathering ripe fruit in any quantity; plenty of heat and

moisture seems to be the secret. The last house of this fine range is an early orchard-house. Peaches and Nectarines in pots were covered with blossom; the trees are fifteen years old, but seem still in their prime. Mr. Horton, who was for many years with Mr. Rivers, thoroughly understands the treatment of trees in pots, and those who doubt the value of the system should see for themselves the trees here. Sea Eagle, Magdala, Crimson Galande, Humboldt, and Stanwick Elruge are largely grown. Cherries, which were planted out, were also set for an astonishing crop; the two sorts most in vogue being Early Rivers and Black Tartarian.

The long glass covering to the wall is divided also into three parts. The first has sliding lights in front, and is devoted to Plums; the trees are trained on the back wall, and also grown in pots in a line down the front. There is room for this, as the glass comes out seven feet from the wall. These trees also are in splendid health, and give every promise of an enormous yield. Green Gage, Jefferson, and Angelina Burdett are the favourite varieties. As the whole range is heated by a flow and return pipe—and there are two flows and two returns in the back wall, which is hollow—the next division is devoted to pot-Vines. Welbeck has always had a reputation for these, and the show for the present year quite sustains the reputation. In fact, it seemed rather cruel to crop small Vines so heavily, but as the roots were appearing in all directions through the fibrous sods placed round the top of the pots, the plants were evidently well able to bear their burdens. The remaining division is devoted to Pears, those in pots, owing to the fresh soil constantly added, being extremely healthy, notwithstanding the fact that they are oldish trees. Conseiller à la Cour, Marie Louise d'Ueche, Doyenné du Comice, Louise Bonne, Ohvier de Serres, and Mons. Benoist, are about the best for cultivating in pots.

The fruit trees trained on wires on the walls are quite a lesson in the different styles of training. Any tree that shows any sign of failing is instantly replaced, so that there is not a poor tree amongst them. Many Pears do well here that have not always a good character elsewhere, such as Beurré Bachelier, Gansel's Bergamot, Souvenir du Congrès, and Josephine de Malines; indeed, Mr. Horton thinks that success with Pears is a matter of soil rather than climate.

The centre walk, and the walk in front of the main range of vineries, are broadly girt with herbaceous beds.

Mulberries, curiously enough, are grown on walls; one very old tree is loaded every year with fruit—the younger trees do not bear so freely. The soil is a red loam on a gravel subsoil, and there are 15 acres enclosed. The Apricot-case, the huge length of which has already been given, is glazed on Rendle's system, and contains a border under the glass in front, where are grown early dwarf Peas, such as American Wonder, Potatos, French Beans, early Cauliflowers, Carrots, Parsley, and salad plants, thus enabling the supply of vegetables to be kept up all the year independent of seasons. Since it is probably the longest wall of Apricots in the world, room has been found to plant a great many of the French varieties, such as Luizet and Pêche de Nancy, but none of them equal the old Moorpark. The Royal drops its fruit under glass as much as it does on the open wall. Every tree was in robust health, and the crop promised to be enormous, as I was informed it has been every year hitherto. As the lights in front are removable, the wood gets thoroughly hardened

in the autumn. The Peach-case, which is only 120 yards shorter, was a most gorgeous vista of pink, for there is a line of pot trees all down as well as trees on the back wall; these trees are also in the best of health. Waterloo is the earliest Peach, and is succeeded by Alexander, both of which varieties together with Hale's Early, and the splendid late variety Desse Tardive are largely grown. Numbers of trees of Calville Blanche Apple also find a place. It was interesting to notice how distinct the flowers of the different varieties were.

We now come to the ranges of glass on the right hand side as you approach Mr. Horton's house, which although they contain equal features of interest, space will only allow to be described briefly. The main range on this side exactly corresponds to the one described before, with the exception that most of the houses are devoted to Muscats. The conservatory, however, is a cool one, and is devoted to greenhouse Rhododendrons and Azaleas. On the roof is a luxuriant Fortune's yellow Rose. Built on to the back of the wall are a long Mushroom-house and the house for keeping Grapes. The stand in the centre of the latter is so punctured that the bottles face alternately to either side. The ventilation and heating are so perfectly under control, that Grapes will keep sound to the middle of April. Between this range and the tan gallop are the Pine-pits, Cucumber and Melon-houses, long lines of frames, and numerous span-roofs for growing flowers for cutting purposes. The Pines are still affected with the scale, as they have been at Welbeck ever since Speechley's time. The favourite Melon for early work is Albert Victor. Orchids are very little grown; but on the other hand, Carnations are a great feature. There were hundreds of strong plants of Souvenir de la Malmaison (the pink variety), Miss Joliffe Improved, Rising Sun, Mrs. Henwood, and Grace Wilder.

Nearly all the winter crops were destroyed by the frost, but there were some splendid rows of Gilbert's Late Queen Broccoli, which bids fair to be a valuable late sort.

I have only one criticism to make with regard to this well-devised garden, and that is, there is no house devoted to aquatics. In a place of this size it is a great omission, for there is no house so lovely when well managed; the one at Eaton Hall might well be taken as a model. Mr. Horton must be, indeed, Argus-eyed to keep his charge in the high state of cultivation and pattern neatness he does. Without good foremen, it would be impossible, and it will be the wish of anyone who has seen the gardens under his guidance, that these he may never lack. *Fagabond.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CORADINEII ×.

A HYBRID, as is supposed, between *O. Lindleyanum* and *crispum*, with both of which it grows in the neighbourhood of Bogota. It is very variable, but flowers freely in the winter under the same treatment as *O. crispum*. The flower-segments are pale primrose-yellow, with broad spots of a rich reddish-brown, and the lip is of a delicate hue, with a long rich brown blotch in the centre. *Reichenbachia*, ser. 2, t. 21.

O. WILCKEANUM VAR. *ROTHSCHILDIANUM* ×.

A natural hybrid between *O. crispum* and *luteo-purpureum*, being found in the same localities as the two parents, and having intermediate characters, now more resembling the one, in other instances the other parent. The segments are like those of a fine

variety of *O. crispum*, with rich chocolate-crimson blotches on a primrose-coloured ground. Culture like that of *crispum*. *Reichenbachia*, ser. 2, t. 22.

CYPRIPEDIUM LAWRENCEANUM VAR. HYEANUM.

The history of this fine variety is given in the *Gardeners' Chronicle* for May 8, 1886. This is an albino form, or, rather, a green-flowered variety of *C. Lawrenceanum*, a discovery of Burbidge's in North Borneo. *Reichenbachia*, t. 23.

CATLEYA INTERMEDIA PUNCTATISSIMA.

A Brazilian species, very variable in character. That represented at plate 24 of the second series of the *Reichenbachia* is one of the most distinct. The sepals and petals are broad; the lip also is of good shape, and all are profusely dotted with rose on a lighter ground.

CATASETUM BUNGEROTHII ?

The female of this handsome *Catasetum* has appeared on several occasions. First, with Messrs. Linden, of Brussels, in December, 1888, when it was figured in these columns (April 13, 1889, p. 461, fig. 83), then with Messrs. F. Sander & Co., of St. Albans; R. B. White, Esq., of Arddarroch; and Messrs. Backhouse & Son, of York, successively (see *Gardeners' Chronicle*, October 26, 1889, p. 466; May 17, 1890, p. 618; *Reichenbachia*, ser. 1, vol. ii., p. 91, t. 90; *C. pileatum*, Rehb. f.). Within the last few days it has been received from Mr. J. Woolford, gr. to A. Palmer, Esq., East Thorpe, Reading, and from Messrs. F. Sander & Co., of St. Albans. The latter specimen is very interesting. It is a four-flowered raceme, though the lowermost flower has been removed. The next one is a female, and the uppermost a male, both quite perfect, but the intervening flower is somewhat intermediate. It is, for the most part, a female one, both in shape and colour, but one side of the lip shows a slight approach to the male form, while the short stout column, quite like the female in this respect, is rostrate, as in the male, and has a rudimentary antenna on one side, and a more developed one, of two lines long, on the other. The difference in colour in the two sexes is as remarkable as is that in form. The male is pure white, except the base of the spur, which is deep yellow; but the female has greenish-white segments and column, and the lip wholly deep yellow inside, and pale dull yellow outside, with light greenish nerves. *R. A. R.*

CATLEYA GIGAS.

An exceptional form of this handsome *Catleya* has lately flowered with E. Gotto, Esq., The Logs, Hampstead Heath. From tip to tip of the petals it measures fully 9 inches, while the front lobe of the lip and the petals are each over $2\frac{3}{4}$ inches in diameter. It is exceptionally fine, both form and colour being equally perfect.

ODONTOGLOSSUM PURUM.

A plant of this rare *Reichenbachian* species has just flowered with Messrs. F. Sander & Co., at St. Albans. It much resembles *O. Lindleyanum*, both in form and colour, though it may be easily distinguished by its possessing a four-lobed crest, not a two-lobed one; also by the longer, more chirose column-wings. A peculiarity, which has before been observed is, that some flowers have a purple blotch on the lip in front of the crest, while in others, on the same raceme, this part is wholly white. It is also near *O. Wallisii*, though specifically distinct.

CYMBIDIUM LOWIANUM VAR. CONCOLOR.

This is a very striking variety, in which every trace of red has vanished from the flower, which thus becomes of an almost uniform light greenish-yellow, and forms a strong contrast with the ordinary form. An excellent photograph shows that it possesses no other peculiarity. It is a fine plant with four racemes, which has appeared with Mr. Charles Eastwood, Lane House Nursery, Luddenden, Manchester. A single flower also came from the Liverpool Horticultural Company without any note of its origin. *R. A. R.*

CYMBIDIUMS.

These thrive well in the temperature of the *Catleya* house, and even a little less warmth will suit them well, especially during the winter. In the summer months they enjoy an abundance of water, both to their roots and over-head in sprinklings from the syringe, but they should not be exposed to the mid-day sun when the foliage is wet, as this will cause the leaves to become spotted; in this condition they do not present a nice appearance. In the winter much less moisture is necessary, but the plants must not be allowed to become dry at any season. They are very large-rooted plants, and therefore require larger pots than the majority of Orchids, but this need not be carried to excess. The soil we find to suit these plants best is about two parts good turfy loam, one part fibrous peat, and one part good leaf-mould, adding a little sharp sand and some medium-sized nodules of charcoal to help in keeping the soil in a porous condition. *Orchid Album*, vol. ix., part 108.

CATLEYA DOWIANA AUREA.

This requires to be kept dry and cool immediately after its growth is completed, and it should not be allowed to stand in strong heat until growth starts again, as we recently observed had been the case with one grower of these plants, which had half made growths in the middle of winter. Such growths never can flower, and by such treatment the plant gets the character of being a shy bloomer, but this it does not deserve if it is carefully handled in the autumn, and the winter growth is avoided. It enjoys an abundance of sun and light, and to obtain this we grow it in a basket, so that it may be hung up near the roof-glass, the basket being thoroughly well drained. The soil should be good fibrous peat and a little chopped sphagnum moss, mixing a few medium-sized nodules of charcoal with the soil during potting for the purpose of keeping it open; during the growing season it is a plant which likes a liberal supply of water, hence the necessity of providing ample drainage, for although *Catleyas* like water, they cannot long survive or keep in a healthy condition if it remains in a stagnant state about their roots. *Orchid Album*, vol. ix., part 108.

HARDY FRUIT CULTURE IN SOUTH WALES.*

THE climate and the soil and situation in many places in South Wales are admirably adapted for the cultivation of all kinds of hardy fruits. With these natural advantages, and the increasing demand for fruits of all kinds in our large towns and populous mining districts, it is surprising that some of our intelligent and energetic market gardeners have not long since made fruit growing a specialty on a large scale in the neighbourhood of Cardiff. After eighteen years' experience of growing fruit in this district, I am thoroughly convinced that as fine Apples, Pears, and Plums, and other kinds can be grown here in the vales of Glamorgan, and in many other places all over the country, as those produced in the best fruit-growing counties in England, if proper care be taken in selecting and cultivating the most suitable varieties.

There are few orchards in Glamorgan, and what few I have seen are (and have been) much neglected. To judge from the stunted sickly appearance of some of the trees, and the bushy mass of branches in others, nothing has been done to them in the way of pruning and manuring the soil since they were planted. The planting, no doubt, in the majority of cases, was crude, and consisted simply of digging a hole without any previous preparation of the soil, putting the roots into it and covering them with earth, after which the tree was left to its own resources—nothing being done to it afterwards.

To be successful in the cultivation of fruits of any kind the best sites should be chosen, and the ground thoroughly prepared, when necessary, by draining,

trenching, digging, and manuring before planting the trees. In orchards, Apple and Pear trees should not be less than 30 feet apart each way, and none but the best trees—worked on the free stock—with straight clean stems of 6 feet before branching, and not more than three years old from the time of budding, should be planted.

I may say here that I remember an intelligent farmer telling me in all earnestness, that his father was a successful cultivator of the Apple in this district, that he grafted his own trees, and those he grafted on the Grey Willow stock—which I take to be *Salix caprea*—succeeded the best on his heavy soil—the lias clay. It is needless for me to tell the members of the British Fruit Growers' Association that I have had no experience of that stock! Plants that have stood in nursery rows for years, and have been pruned repeatedly to keep their heads within bounds, seldom make good trees. When lifted they have scarcely any fibrous roots, and after replanting become stunted, and fail to make much growth for several years. On the other hand, young vigorous trees, planted at the age mentioned, start into growth at once, and soon become large and fruitful. In planting, the varieties must be kept by themselves as much as possible for the sake of uniformity of growth, and convenience in gathering and storing the fruit. Make the pit large enough to hold the roots without being cramped, and a strong stake driven into it to tie the tree to. After which place the tree close to the stake, spread the roots out on all sides before filling in the soil, which should be made firm, but care must be taken not to plant it deeper than it was when growing in the nursery row. When planted secure the tree to the stake, prune it, and mulch the surface with manure to exclude air and to keep down evaporation. All that is required now is to protect it from cattle, sheep, and horses. Barbed wire guards I find the best; they are cheap, durable, and answer the purpose better than any other kind of protection that I know. The principal culture of orchard trees is during the first few years when they are young. It consists of pruning and cutting out all weak useless branches and those that cross each other, keeping the trees clean and free of insect pests, and top-dressing the ground with good manure to keep them in a vigorous and fruitful state.

FRUIT GARDENS.

The cultivation in the fruit garden is different from that of an orchard. Apple and Pear trees may be planted here a little closer, say, from 18 to 20 feet apart, and trained in pyramidal form, and the ground worked and cropped between them with Gooseberry, Raspberry, Currant, and Strawberries, or vegetable crops, until they have filled their allotted space. I have recommended that the orchard trees be three years old from the time of budding; but for planting in the garden I prefer maidens or plants of one year's growth from the bud to those of four or five years' growth. They soon establish themselves, and grow faster than older trees, and can be trained to the form desired much easier. I repeat that too much care and attention cannot be taken in planting, and none but the very best trees should be planted to ensure successful cultivation.

There are several fine Apple and Pear trees in the Castle gardens here, both on walls and in the open quarters of the garden, which are much admired by gardeners and others visiting the place. They were all planted, pruned, and trained under my supervision, and perhaps I could not do better than describe the mode adopted in growing and training them. To avoid repetition, I may say that most of the trees were planted when maidens of one year's growth. The Pear trees on the walls are planted at the distance of 21 feet apart, and trained in fan-shape with a leader up the centre. When planting them they were kept away 6 inches from the bottom of the wall to allow room for the stem to swell; the roots were spread out carefully and covered, the ground made firm, and mulched with manure afterwards. The leaders were then cut back to within 18 inches from the

* A paper read by Mr. A. Pettigrew, at the Cardiff Conference of the British Fruit Growers' Association, August 12, 1891.

ground, and fastened loosely to the wall. In the following year they produced from three to five shoots each, which were carefully but loosely nailed to the wall as required during the growing season, and allowed to grow their full length without being stopped. At pruning time the centre shoot of each tree was cut back to within 18 or 20 inches from where it started, according to the strength of the growth, and to two or four remaining shoots, as the case might be, were nailed to the wall their full length; the two lower shoots horizontally, one on each side of the main stem, and the others at a slight angle up the wall. From this time on, until the trees had occupied their full space, they were examined regularly every spring shortly after starting into growth, and all the superfluous buds rubbed off the leading shoots, and a few of the buds near the ends of the permanent branches picked off to strengthen the terminal bud. I never shorten the points of the permanent branches until they have grown their full length, unless they have met with an accident, or the wood happens not to be sufficiently ripe to remain. The breastwood is taken off two or three times during the season, but I never pinch and stop the growths during the summer, as recommended by some writers.

To build up young trees and furnish the wall with them in the shortest time possible, I have stopped the leading shoot of the current year's growth after it had grown about 2 feet in length, which caused it to send out lateral branches. These in good seasons ripened well, and a year's growth was gained by adopting this method; but I do not recommend it in a general way, as the success mainly depends on the seasons being good to ripen the wood thoroughly.

PRUNING.

The trees are pruned as soon after the leaves fall as possible, and the roots mulched with enough stable litter for a breadth of 3 feet from the bottom of the wall, after which the branches are syringed with a wineglassful of petroleum to a gallon of water. All is thoroughly mixed by the syringe, continually churning it up during the operation. The petroleum thus applied, kills scale, and all insects it comes in contact with, and it gives the bark of the trees a smooth and healthy appearance. This finished, the branches are then secured in their proper position for the year.

PYRAMIDAL TREES.

These, though differently trained, are built up much in the same way as wall trees. When newly planted they are cut down to within 18 inches from the ground, and the following year they produce from three to five shoots each. One of the strongest of these is selected for a leader, which ultimately becomes the stem of the tree, and all the others are rubbed off except three of the best placed, which are retained to form the base and framework of the tree. The shoots are allowed to finish the season's growth without being stopped in any way. When they are being pruned in the autumn the leading shoot is left from 18 inches to 2 feet long, according to the strength and ripeness of the wood (but as the trees get older the leading shoots may be left even longer), and the side branches a little shorter. This system is practised year after year, cutting out all cross and superfluous wood, and training and furnishing the tree with well-arranged branches until it has filled its space, after which, the growth is spurred in the usual way close to the permanent wood every season to form fruit buds. I do not believe that stopping and pinching the young shoots during summer adds to the productiveness of the tree; besides, it is impossible in large fruit gardens, where there is a great number of trees, to find time to do so.

I do not advise root-pruning to be practised except in cases where the roots have penetrated a cold wet subsoil, in which the trees produce strong rank unfruitful wood. When such is the case, and the trees are young, they should be lifted entirely, the strong roots cut back, and the fibrous roots spread

out near the surface; but when the trees are large it is advisable to dig a trench 3 or 4 feet distant from the trunk all round, cut back the strong roots, and add some good soil to encourage fibrous roots to grow near the surface.

The Apple is more liable to the attacks of insect pests and disease than the Pear. The canker is the most difficult to deal with, and some varieties are more subject to it than others. When planted in low damp situations, the trees get covered with moss and lichen. They are also subject to the attacks of American blight, and this, in my opinion, is one of the principal causes of canker; but there is a great diversity of opinion about this. When once a tree is attacked with canker it is almost impossible to cure it, and the sooner it is grubbed out and a new one planted in its place the better. I think it is a mistake to lose time and valuable space with a sickly tree from any cause whatever, when trees can be bought so cheaply from our nurserymen. Moss and lichen can be destroyed by dusting the trees with newly-slacked lime on damp mornings during the winter months, and American blight by scrubbing the bark of the affected trees with a hard brush and soap-suds, and by frequent syringings of petroleum mixed in water as previously described.

Of Apples there are more than forty varieties, and of Pears about the same, grown in the Castle gardens. But the following twenty-four of each are amongst the most useful, both culinary and dessert. Apple: Devonshire Quarrenden, Irish Peach, Lord Suffield, Keswick Codlin, Lord Grosvenor, Pott's Seedling, Bleuheim Pippin, Beauty of Hants, Cox's Orange Pippin, Ecklinville, Emperor Alexander, Gloria Mundi, Golden Noble, Hawthoruden, Annie Elizabeth, Sturmer Pippin, Alfriston, Beauty of Kent, Dumelow's Seedling (Wellington), Lane's Prince Albert, Rymer, Warner's King, and Rushock Pearmain.

Of Pears, the following twenty-four varieties are grown successfully, both on walls and pyramidal trees in the open. Duchesse d'Angoulême, Jargonelle, Summer Bergamot, Beurré Magnifique, Beurré d'Amanlis, Beurré Diel, Beurré Rauce, Beurré d'Esperen, Durondeau, Louise Bouve of Jersey, Pit-maston Duchesse, Uvedale's St. Germain, Thompson's Brown Beurré, General Todtleben, Doyenné du Comice, Glou Morçeau, Winter Nelis, Marie Louise, Beurré Bosc, Beurré Clairgeau, Williams' Bon Chrétien, Vicar of Winkfield, and Gansel's Bergamot.

PLUMS.

The trees in the open quarters here are treated much in the same way as the pyramidal Apple and Pear trees, and those on the walls are pruned and trained the same as the Pear trees in that position. The Plum, like most of the stone fruits, is subject to the attacks of aphides, red-spider, honeydew, mildew, gum, and canker. The aphides generally show themselves first on the points of the young vigorous shoots, which they cause to curl. As soon as they are observed, the points of the shoots should be nipped off, to keep them from spreading over the tree, except in the case of the main shoots of wall trees, when the affected leaves should be picked off to preserve them entire. Syringing the trees with soap-suds and tobacco-water keeps them in check, but once the trees are badly affected—as they are in some places this season—it is not easy to get rid of them by any means. Honeydew is the effect of aphides' attacks. Red-spider is difficult to master in dry seasons, and some districts are worse for it than others. All kinds of deciduous trees are subject to it in warm close confined situations like the Castle gardens here. If once they get a strong footing, it is almost impossible to eradicate them by any means. Mildew may be destroyed by sulphur in some form or other. Gum and canker cause the leaves of the affected trees to silver, and the branches to die back. When such is the case, I know of no remedy except taking the trees out and planting young ones in their place.

There are many varieties of Plums to choose from, culinary and dessert. The following are what are

chiefly grown in the Castle gardens: Victoria, Denniston's Superb, Nectarine, Prince Engelhart, Bryanstone Gage, Transparent Gage, Kirk's Purple, and Coe's Golden Drop.

I have thus endeavoured, in as plain and practical way as I could, to deal with the subject I was invited to speak upon; and I trust the remarks I have offered may have the effect of causing more attention to be paid to the culture of our hardy fruits.

THE GENUS BROWALLIA.

THE great botanist Linnæus had among his numerous acquaintances a certain friend named Johu Browall, who was very humble in his relations with Linnæus, and, having adopted his new sexual system of botany, wrote an article against Siegesbeck defending that system. Linnæus, in acknowledgment of his friend's services, dedicated to him a genus of a single species, naming it *Browallia demissa*. Shortly afterwards Browall, having been made Bishop of Abo, assumed the pomp and dignity of a great magnate, and Linnæus having discovered a second species of this genus named it *B. exaltata*.

This excited the wrath of Browall, and he proceeded to write pamphlets against Linnæus, denouncing him in the most severe language. Later on, Linnæus discovered a third species differing slightly from the original outline of the genus, which he named *alienata*. The two men were never afterwards reconciled to each other, and thus we have preserved in the nomenclature of this genus a historical incident to which future generations of botanists will look back with considerable interest.

Speaking from a botanist's point of view, it is a genus of half-hardy shrubs or herbs belonging to the order Scrophulariaceæ, and bearing white or blue and in one species orange flowers. The corolla is salver form in general outline, but becomes twisted through the contortion of the upper end of the peduncle. &c.

SOME CAUCASIAN MAPLES.*

1. ACER VOLXEMI.—Some years ago, as we have already had occasion to mention, M. J. Van Volxem, of Brussels, was good enough to send us three young trees raised from seed, that he had himself gathered in the Caucasus.

One, the form that we named *A. Volxemi*, a second received under the same number as the preceding, and a third quite distinct from either, and labelled *velutinum*. The one we named *Volxemi* grew very rapidly, and made splendid foliage, of a silvery hue on the under surface. As the materials for a full examination were wanting in the first instance, it was natural that some considered it only a form of *A. pseudo-platanus*, others of *A. insigne*. For our own part, we have had the tree under (or rather over!) our eyes almost every day for fourteen years, and, moreover, we have had the advantage of communicating with various authorities on Caucasian trees, and especially with M. Boissier, who forwarded us type specimens of his *insigne* and other species for comparison. This year the tree in question flowered in the collection of M. Van Volxem. The flowers, as will be seen from our illustration at p. 189, settle the question that it is no form of *pseudo-platanus*, in spite of M. Wesmæel's opinion to the contrary in the recently-published *Mémoires de la Société Royale de Botanique de Belgique*, t. 29, 1891, p. 36, an opinion formed, of course, before he could have seen the flowers.

* ACER VOLXEMI, Mast., in *Gard. Chron.*, 1877, p. 72, f. 10; fol. et fruct.; 1891, p. 189, fol. et flores. Nicholson in *Gard. Chron.*, 1881, p. 10.

? = *A. Trautvetteri*, Medwedjeffs, Mitt. et in Kaukasischen landwirthschaftlichen Gesellschaft, heft iv. and v., Tiflis, 1880 (ex Wittmack in *Garten Flora*, 1891, p. 263). Pax. in *Just. Bot. Jahrb.*, 1880, 2, p. 80.

A. INSIGNE, Boissier et Buhse Aufz., p. 46. Boissier, *Flora, Orientalis*, 1, 18, p. 947; *Garten Flora*, 1881, p. 120; Pax. Mon. *Acer in Engler Bot. Jahrb.*, vii., 195. Wesmæel-excl. synonym. β *velutinum*, Boissier, *Flora subitans velutino tomentosa*. = *A. velutinum*, Boissier, *Diagnoses* [nec hort.], ser. 1, vi., p. 28, Wesmæel (see fig. 24).

It is possible that *A. Volxemi* is a form of *insigne*; all that we can say upon that point is, that it was not recognised as *insigne* by Boissier himself nor by other botanists who have collected in the Caucasus. Neither does it agree with any specimen of *insigne* that we have seen in the London herbaria. With great deference to our colleagues who hold different

2. *A. TRAUTVETTERI*.

This was described from the Caucasus by the Russian botanist, Medwedjeffs, in 1880. From the remarks and figures on this species by M. Wolf of St. Petersburg, Dr. Dieck and Professor Wittmack, in the *Garten Flora*, 1891, p. 263, we were led to the conclusion that this might be the same as our *A.*

is quite different from *insigne*, and moreover that our *A. insigne velutinum* was rightly so named.

3. *ACER INSIGNE* VAR. *VELUTINUM*.

The next Maple of which we have to speak was received from M. Van Volxem, under the same label as *A. Volxemii*. It was obvious from the first that

FIG. 24.—A BARDY CAUCASIAN MAPLE: *ACER INSIGNE*, VAR. *VELUTINUM*. LEAVES DOWNY ON THE UNDER-SURFACE FLOWER; IMMATURE AND MATURE SEED-VESSEL.

views, we nevertheless retain our opinion as to the specific distinctness of Van Volxem's Maple. For avenue planting, or where hardihood, rapid growth, and noble foliage are desiderata, we advise a trial of this tree; with us it is growing in garden soil overlying thick clay, and grows so rapidly that as our space is very limited it has to be headed back every year. On the sand at Kew it does not thrive so well.

Volxemi. To settle this point, we applied to Professor Wittmack, the Editor of the *Garten Flora*, who kindly sent leaves of our *Volxemi* and of *A. insigne velutinum* to Dr. Dieck, who travelled in the Caucasus last autumn, and saw both trees in their native country. We are now in possession of Dr. Dieck's reply, which is to the effect that our *Volxemi* is probably the same as *A. Trautvetteri*, and that it

it was quite different from that, being of much slower growth, with smaller foliage, slightly downy on the under surface. Our own impression originally was that it was a form of pseudo-platanus, but last year and the year before it flowered, and its affinity to *A. insigne* was then at once revealed. This year it has flowered again more freely, and the young inflorescence is figured at fig. 24, together with a

ripe fruit from Caucasian specimens. This tree, planted at the same time in the same garden as Volxem's Maple, has attained a goodly size, but it has never required heading down, and might, when not in flower, readily be taken for a variety of the common Sycamore. On comparing it with Boissier's specimens communicated by that eminent botanist, and on consultation with Dr. Dieck, and also with Dr. Stapf, now at Kew, and who is familiar with the plant in the Caucasus, there is no doubt remaining that the tree is *A. insigne* var. *velutinum* of Boissier. Mr. Nicholson also kindly sends us specimens of ordinary *insigne* as received from M. Max Leichtlin from Turkestan.

4. ACER SP.? (= *A. INSIGNE*, *Bot. Mag.*, nec BOISSIER).

The third tree sent by Mr. Van Volxem, under the name *velutinum*, is altogether different from either of the preceding. It flowered soon after planting, and repeated the process annually till killed. Its prominent characteristic, from a horticultural point of view, lies in the brilliancy of its crimson bud-scales. With us it was always more or less spring-tender, and during one of the recent severe winters, our tree declined the unequal contest, and succumbed. This is the species figured in the *Botanical Magazine* as *A. insigne*. We suspect, however, some displacement of labels, for the name *velutinum*, under which we originally received this from M. Van Volxem, and also other specimens through the good offices of Mr. Nicholson, from MM. Simon Louis Frères, of Metz, applies more properly to the variety of *insigne* previously mentioned. What the *Bot. Mag.* *insigne* may be, we do not at present venture to say. We incline to the belief that it is a new species, but, in any case, it is certainly not the *insigne* of Boissier. *M. T. M.*

KEW NOTES.

SADRAUA SPECTABILIS.—An example of this fine tropical shrub is now in flower in the T-range at Kew. It was received from the Royal Botanical Gardens of Brussels under the name of *S. macrophylla*, and it was figured in Regel's *Gartenflora*, t. 534, under this name. It has handsome foliage, nearly a foot long, lanceolate-obovate, serrate, and dark green. The flowers, which are fragrant, and not unlike those of the Tea plant, but a little smaller, are borne in large branched panicles from the axils of the leaves near the end of the shoots. There is a figure of this species in the *Botanical Magazine*, t. 3982, made from a plant "raised by Mr. Knight, of the Exotic Nursery, King's Road, Chelsea, from seeds imported from the Republic of Bolivia in 1838. . . Its beauty is of long duration, and we scarcely ever saw any stove plant more truly elegant and graceful."

Aristolochia grandiflora is now flowering freely in the Victoria House. Although introduced and figured in the *Botanical Magazine* nearly fifty years ago (t. 4368-9), this species had long ago disappeared from cultivation, until it was re-introduced three years ago by Mr. E. D. Sturtevant, of Bordertown, New Jersey, who kindly sent a plant of it to Kew. The leaves are large and heart-shaped, the stems climbing, and extending along the rafter to a length of about 15 feet. Already over thirty flower-buds are formed, and the first one has expanded this morning (August 8). In shape the flower is not unlike the popular little *A. elegans*, but the corolla measures 17 inches in width, by 5 feet in length, over 3 feet being narrowed into a long tail. The colour is rich cream-yellow, thickly mottled with black purple, and the mouth of the tube, which is nearly 5 inches across, is wholly black velvety-purple, the same colour surrounding the rim. In my opinion, this species is at least as interesting as *A. Goldiana*, and it is a much better garden plant.

Mariscus umbilensis, C. B. Clarke.—This is the correct name of the plant known in English gardens as *Cyperus natalensis*; so says Mr. Clarke, who is at present engaged in working up Cyperaceæ for the *Flora of India*, and to whom flowering and fruiting

specimens of this plant have lately been submitted. The old genus *Mariscus* was sunk in *Cyperus* both by Bentham and Boeckler; but Mr. Clarke proposes to reconstitute *Mariscus* as a good genus, but on totally different characters from those of the old *Mariscus*.

Mariscus umbilensis appears to be common in extra-tropical South Africa; it has been named *Cyperus umbilensis* by Boeck. in MS. in a collection from Umbilo, in the Walfisch Bay Territory. There is a true *Cyperus natalensis* of Hochst., which, however, differs very widely from the garden plant of that name, and which, so far as I know, is not in cultivation. *M. umbilensis* has long, arching, grass-like, glossy green foliage, and erect flower-heads, 2 to 4 feet high. The spiculae are deciduous, proving it to be a *Mariscus* and not a *Cyperus*, in which the spiculae are persistent, the glumes only being deciduous. It is a very elegant foliage plant, retaining its foliage for months in a healthy green state in an ordinary room. It may be raised in quantity from seeds, which are ripened in abundance by cultivated plants.

Crinum Moorei (white variety).—This is now in flower in the Bulb frame at Kew. It has flowers quite as large and substantial as the best forms of the pink-flowered type, and of the purest dazzling snow-white. Regel published a figure of it in *Gartenflora* under the name of *C. Schmidtii*. The Kew plant was received from Mr. Woodall of Scarborough, who had obtained it from someone as *C. giganteum*. It is a beautiful *Crinum*, and from the fact that it is almost hardy it is certain to find much favour. As a greenhouse *Crinum*, it has no equal among white-flowered kinds.

Lilium Henryi is much finer this year than it was last. It is an orange-coloured *L. speciosum* simply. *L. chloraster* is a much better garden Lily than its name would suggest; it is quite as large as *L. Brownii*, to which it bears a resemblance. Lily fanciers should see this plant now represented by strong flowering specimens in various parts of the garden. *W. W.*

Lysimachia paridiformis, sp. nov.—This interesting new species has just flowered in the Royal Gardens, Kew, the plants having been raised from seeds sent home by Dr. Henry from Central China. It was first described by Franchet in *Bull. Soc. Linn., Paris*, 1884, p. 433, along with its varieties *L. steodophylla* and *L. elliptica*, from specimens collected at Kweichan, Dr. Henry's specimens being found in Ichang and the immediate neighbourhood. It has also been found in Kwangtung by Mr. Ford, and his specimens differ in the stems being leafy instead of only scaly, as in the specimens now flowering at Kew, and which rightly appears to be Franchet's var. *elliptica*. In habit *L. paridiformis* closely resembles the broad-leaved variety of *Trientalis*, and also, as its name suggests, *Paris quadrifolia*. The stems are from 1 foot to 18 inches high, bright red, and with three or four pairs of opposite scales instead of leaves. The leaves proper, which are elliptic tapering to both ends, are in opposite pairs, but so close together as to suggest whorls of four, and hence the striking resemblance to the *Paris*. They are yellowish-green when young, but assume a deep purple tint as they become older. Flowers numerous, axillary, as large as those of *L. vulgaris*, bright yellow, with eye of a deeper tint. So far as we are acquainted with the habit and flowering of *L. paridiformis*, it will make a very useful rock plant; and as the plants withstood the late severe winter without any protection whatever, no fear need be felt about its not proving hardy anywhere in England.

L. Dahurica, which botanists say should rank as a variety of *L. vulgaris*, we also notice in flower in the Kew rockery. It is a very common plant from Dahuria to Mandshuria, and proves of much value as an autumn-flowering rock plant. To the gardener it differs widely from *L. vulgaris*—first, in its later flowering season; and second, and which is of much more importance, it does not produce runners like *L. vulgaris*, is more graceful in habit, and lasts longer in flower.

Erysimum Wahlbergii, which is now flowering

in the herbaceous grounds at Kew, is new to us, and promises to be of much interest and value as an early autumn-flowering plant. With the exception of *E. Perowskianum*, it is the handsomest of the taller-growing species, the flowers are as large as those of *E. ochroleucum*, and very showy. It grows 1½ to 2 feet in height, much branched, and with numerous lanceolate, entire, or slightly and irregularly toothed or notched leaves. The flowers are over half an inch in diameter, of a bright deep yellow, and when in full flower a very striking object.

Primula Poissoni, which flowered at Kew for the first time in England two months ago, is still flowering vigorously. This, without exception, is the most persistent flowering *Primula* we know, and as the seedlings have shown a great variety in the shade of purple, we may expect something very fine from the seedlings raised from the plants now in flower. It is found in marshy spots, and if grown in pots, they should be stood in saucers of water.

Crocus Sharojani is now in flower in the herbaceous grounds at Kew, and the novelty of an orange-flowered *Crocus* in early autumn is, indeed, pleasing. It varies in time of flowering in England, from the end of July until August 10 or 12; the past severe winter does not seem to have interfered with it much, as it shows as much vigour now as when first imported. It is a native of the Northwest Caucasus, and the mountains south of Trebizond, where it is found at an altitude of 7000 feet, and usually associated with *C. vallicola*, to which it is nearly allied, and which flowers three weeks later. *C. Sharojani* is one of the two species in which the previous year's leaves remain until the autumnal flowering time, and although apparently perfectly hardy, it is a species that resents lifting and storing more than any other species. The flowers, as already noted, are of a bright deep orange, and very showy. *D.*

DOES IT PAY TO GROW APPLES?

THIS was the heading of an interesting and instructive article in *Gardeners' Chronicle*, of May 2, 1891. The remarks therein are none too severe upon the shiftless fruit farmers of England or America, who take no pains, and spend no money to keep their fruit trees in a free-bearing condition. I felt strongly tempted to pen a few remarks on this important subject after the sudden change to ungenial weather on Whitsun eve. Our uncertain climate no one can fight against in any other way than by adopting good cultivation; and herein lies the difficulty with English farmers—they seem to have a rooted aversion to spade husbandry; they will scratch their fields lengthways and across, harrow the clods up and roll them down as often as you like, yet the best of it does not loosen the ground more than 8 or 9 inches deep, and the sole of the plough forms a compact hard floor at that depth. But good gardeners know well that this method of culture will not do for Apple trees; and when it comes to handling the spade, verily a shoemaker or a tailor can do better work than the average farm labourer—or, to use his new election name, journeyman farmer.

In these progressive times the fruit farmer is not, and ought not to be, dependent upon the old-fashioned broad-soled plough and horse labour to bring his land into good cultivation for fruit farming; if he does depend upon such, he is leaning upon a bruised reed. What is wanted in the ordinary cultivated farms is some sort of cultivator that will stir the soil to the depth of 15 or 18 inches, without bringing the subsoil to the surface, and thus breaking through the hard pan formed by centuries of ploughing—sometimes, as I have ascertained by measurement, less than 6 inches below the surface. For this purpose the steam cultivator is specially adapted; it crashes through the hardest clay subsoil with ease, stirring it up throughout to any required depth. The work may be done for about 15s. an acre, the farmer finding coals for the engine, which is not a

rious expense. The surface could then be well shaken up with the harrow, and a good foundation laid, upon which to plant the trees. I am no advocate for burying much manure in the ground, but all my experience goes to prove that stirring it up well to the depth of about 15 or 18 inches is absolutely necessary, if success for a good term of years is to be looked for. The right way to apply the manure is in the form of surface-dressings, put on in the winter and lightly forked in, in the early spring-time. In dry summers, a mulching of decayed manure is excellent to place over the roots, especially if the soil is light, and the sub-soil infertile.

Drainage is sometimes, but not always, necessary. In a garden of which I had charge for twenty years, we could grow excellent Apples, and it was not drained. Where my lot is now cast, drains 3 feet deep, with a good outfall, are quite as necessary a part of the culture of the trees as pruning and manuring.

As to the sort of trees to plant, the varieties best adapted for the district, and the distance they ought to be asunder, are matters which may well lead practical men to grave discussion.

I had recently a long drive through the Kentish orchards near Swanley (where, by the way, Mr. Cannell has been successfully urging the farmers to drop the plough and take to spade husbandry), and a few days ago I was shown over the large orchards planted at Sawbridgeworth by the Messrs. Rivers, father and son, and in Kent as well as in Hertfordshire, standard and half-standard trees have been planted at a distance of some 16 feet apart, the intervening spaces being planted with Currant, Raspberry, and Goose-berry bushes, or in some instances Strawberries. In each case the larger proportion of the trees were Plums. The Sawbridgeworth soil is better adapted for Plums than for Apples, it being a good holding loam with a chalky subsoil, excellent for growing Wheat. I am in favour of the bush form for Apples, and prefer the best culinary varieties, these being as a rule the best paying crop, generally bringing in the London markets 7s. or 8s. a bushel fresh gathered from the trees. Everyone wants Apples, and would like to have good fruit, if it can be obtained, and the demand for fruit of the best quality increases every year. Therefore, the old scrubby orchards do not pay, and as the quantity of good fruit sent into the market goes on increasing at a rapid rate, the money obtained for fruit of inferior quality will be less and less. The American writer says truly that "neglected orchards, like neglected children, are rarely a pleasant heritage." The word "never" might have been substituted for "rarely" in the case of orchards. Children have a power of will, which, if exerted, may raise them above the consequences of neglect and down-troddenness, but there is no volition in an Apple tree. This question has been much before the public lately, and there has been a moving amongst the dry bones, but it is not a new thing. Nearly a hundred years ago, Mr. Thomas Andrew Knight was concerned about the decay of the Apple orchards, but Knight and other leading cultivators did not hit upon the true cause of the decadence of the fruits, in which they were certainly intensely interested. One grand idea of Knight's, in which there is probably a little truth, and some superstition, was, that trees of a certain age tended to decay even in their young state. Referring to some of the popular Worcestershire varieties of Apples, he says:—"The Moil, and its successful rival the Redstreak, the Masts, and Golden Pippin, are in the last stage of decay, and the Scire and Fox-whelp are hastening rapidly after them;" and after a dissertation on experiments with the old sorts of Apples, he believed he was "justified in the conclusion that all plants of this species (the Apple), however propagated from the same stock, partake in some degree of the same life, and will attend the progress of that life in the habits of its youth, its maturity and decay," and thinks it necessary to add, "though they will not be any way affected by any incidental injuries, the parent tree may sustain after they are detached from

it." London thought Knight's doctrine contrary to the general analogy of plant life, and remarked that "Vines, Olives, &c., have been propagated by extension for ages, and are still, as far as can be ascertained, as vigorous as they were in the days of Noah or Pliny." Speechly, and other good gardeners of the time, blamed the climate, and supposed "that the return of genial seasons will restore to us, from old trees, as good fruit as heretofore." I nowhere find that the cultivation was supposed to be at fault. We know better now, and if the old gnarled trees, picturesque with lichens dangling from every branch, are anywhere retained, it can only be for their look of antiquity, as old-world curiosities, or for the study of the parasitic lichens, silvery, green, and gold, which are beautiful exceedingly to the students of these interesting plants.

The fact remains, and is sufficiently clear to those who will study the signs of the times, that for the production of a paying crop, the old trees must go. Plant young trees of the best varieties after the soil has been prepared by good cultivation, and on land that can be bought from £50 to £100 an acre. Apples will then pay, and give the cultivator much pleasure, as well as being a good investment for his money. *J. Douglas.*

CASTLE HILL, ENGLEFIELD GREEN.

This compact estate, the property of G. C. Raphael, Esq., is of fifty acres in extent, and mainly consists of gardens and pleasure grounds. It is embellished by noble trees, which tell of the site having been a garden for a great many years, although the old homestead and its occupiers have long since passed away. On the spot where that building stood, a massively-built modern house of the present owner now stands. From the verandah of the mansion, which is furnished all round with tall tree Ferns, placed at intervals of a few yards, and brightened by hanging-baskets of bright flowers, the eye lights upon an arch of single white Roses of great beauty, which is turned over the walk bordering the flower gardens. In front of the house are two lawns, divided by a piece of water ornamentally treated; further on is a stretch of garden, with another lake beyond. Here, at the edge of the water, are several giant *Taxodium distichum* of great beauty, the largest having a circumference of 12 feet round the trunk: the delicate green tint of their foliage, and their noble proportions, make them striking objects. On the other side are some very large Alder trees, and beyond a very large Tulip tree, which is an especially free-flowerer. Another object of beauty is a large spreading tree of the Lebanon Cedar, whose girth of bole at breast-height is 18 feet; and near it is a huge specimen of a Cedar, resembling the Lebanon in some particulars, but with finer foliage, of a bluish tint, something like that of *Cedrus atlantica*, but certainly not the same as any of the specimens of that species, which are planted near, and may be compared with it. The Firs at Castle Hill are also of great size and beauty, and about the grounds are large trees of things not generally found of any size in gardens, such as the *Gleditsia triacanthos*. Near the house are some very neat looking carpet beds, and beyond these a geometrical flower garden, the centre very effectively arranged with *Ficus elastica* in the middle, then variously tinted *Ricinus*, among which are clumps of *Phalaris arundinacea variegata*, or Gardener's Garters, and the whole broadly banded by dwarf-clipped Golden Yew. The radiating beds are chiefly of brilliant scarlet, pink or crimson *Pelargoniums*, each with an appropriate edging, and the whole forms an admirable combination. For a further supply of flowers there is the Rosery by the lower lake, and everywhere in convenient spots are borders and nooks of showy herbaceous perennials, judiciously planted, with a view to getting a show, even until the hard frosts come.

THE KITCHEN GARDENS are neat and well cropped, the fruits on the walls and in the orchard being good and

fairly plentiful, indeed much beyond the average this season. Among the Peas, Champion of England is stated to have produced marvellous crops of fine quality, and Veitch's Perfection is still the favourite in its class. Under a shady wall in the open garden is a bed of Watercress, growing simply in the garden border, after the manner so often spoken of by the late Mr. Shirley Hibberd, and which is said to be a very successful mode of keeping up an almost un-failing supply if properly carried out. The method is spoken highly of at Castle Hill, and it might certainly be practised with advantage in many other gardens. Everywhere in these gardens, both outdoors and under glass, the neatness and order which Mr. Swan, the gardener, preserves, is very remarkable.

THE GLASSHOUSES.—Some new Orchid-houses have recently been added, and Orchids form a special feature, but they are not allowed to elbow out other good and showy classes of plants. The collection of *Cattleyas* in the large new house are in excellent condition, and as small weak pieces are never bought, there is a very uniform collection of all the leading species, such as *Cattleya aurea*, *C. gigas*, *C. Warocqueana*, the forms of *C. labiata*, &c.; here, too, are some noble masses of *Lælia anceps*, both white and coloured, and all the other *Lælias*, including some stont plants of *autumnalis alba*, of which there are said to be two distinct forms among the different specimens. In this house also *Vanda Kimballiana* and *V. Amesioa* grow far more vigorously and are flowering better than they do where more heat is given them, and specimens of *Cologyne cristata alba* pass over their flowering season without the wrinkling of the pseudobulbs which so many growers complain of. Among the *Cattleyas* in bloom are some good forms of *C. Gaskelliana* and *C. gigas* and *C. Mendelii*, as well as others of the smaller species, and also the bright yellow-flowered *Sobralia xantholeuca*, *Chysis aurea*, *Angraecum falcatum*, *Calanthe natalensis*, and several forms of *Miltonia Roezlii* and *M. vexillaria*.

Here, as in many other places, the *Saccolabiums* and *Acrides*, and some of the *Vandas* are the least satisfactory, but an alteration in the interior of the house is contemplated which will probably lead to better results. In this house, as in many of the other houses at Castle Hill, foliage *Begonias*, *Selaginellas*, *Maidenhairs*, and other plants not liable to insects are planted under the stages and on the end walls, and while assisting to keep a healthy atmosphere in the houses they are pleasing to the eye. Here a fine fine form of the showy *Dendrobium McCarthiae* is in bloom, also *Vanda Roxburghii*, *Oncidium Papilio*, and various *Cyrtipediums*, of which a promising lot of home-raised crosses are also coming on.

THE PHALENOPSIS HOUSE is a success, and that is more than most collections can boast. It is a small house, with bare earth basement, and fitted with a brick bed, such as is found in Melon-houses. This bed has a little bottom heat under the moist cocoanut fibre with which it is covered, and is utilized for striking *Dracenas*, *Crotons*, *Aralias*, and other plants wanted for decoration. From the roof are suspended the plants of *Phalenopsis*, and with them the compact-growing species of *Angraecum*, and the whole of the plants flourish exceedingly, and bloom in the most satisfactory manner, the foliage increasing in size and substance year by year. *Angraecum articulatum* and *A. Ellisii* grow here with the *Phalenopsis* to perfection, and are sending down their long flower-spikes almost as stout as a cedar pencil. It takes time to produce such plants, but it also requires something else, viz., continued good culture.

In the cool houses the *Odontoglossums* are in fine condition, and some are furnished with bloom; here, too, among a batch of *Epidendrum vitellinum majus* is a plant of a perfectly double-flowered form of it, which has proved constant by producing five spikes of double flowers last year and four this season. It is a very remarkable variation, and of considerable beauty (see fig. 18, *Gardeners' Chronicle* for August 1, 1891). With the *Odontoglossums* are the cool-house *Oncidium*s such as *O. macranthum*, *O. lamelligerum*, &c., some of them with flower-spikes,

and a stout plant of the new *O. Leopoldianum*. The *Masdevallias* and *Pleiones* are grown for the summer in cold frames, and that method of culture seems very successful, and the *Dendrobies*, of which there are a large number grown, are now growing vigorously in two of the warmest and most moist houses.

The **GREENHOUSE**, in which the flowering plants are placed, is always a pleasant sight here all the year round, and at the present time there is a marvellous show of flowers on the *Pelargoniums*, *Hydrangeas*, *Lianthus*, ivy-leaved *Pelargoniums*, *Tuberoses*, *Begonias*, *Lilies*, &c. Of the last-named there are many very finely-flowered *L. Wallichianum*, which is a species not often seen doing so well. *Celsia cretica*, too, is a pretty and useful plant here, and the baskets of *Torenia* and blue *Lobelia* are very pretty. In the numerous other houses are divisions filled with *Eucharis*, *Poinsettias*, *Coleus*, *Crotons*, *Dracenas*, and other decorative plants, and the large *Camellia*-house has specimens well furnished with buds, while the *Melon*-houses, *vine*-ries, and other fruit-houses are well in keeping with the rest of these fine gardens.

NOTICES OF BOOKS.

"**LA MOSAICULTURE**."—This title will be a little confusing for English readers, who would hardly suspect that it referred to carpet-bedding. This style of garden decoration is very popular on the Continent, and indeed, with many persons in this country. Whatever we may think of the want of taste generally exhibited, there is no doubt that these beds do possess many attractions, and some employers demand the construction of them by their gardeners. M. Mottet's little book, published by Octave Doin, Paris (London: Williams & Norgate), affords a very useful guide as to the selection and propagation of the plants, the designing and preparation of the beds. Even to those who do not read French, the book will be serviceable, as it furnishes not only ample lists of suitable plants, but also a large number of plans and diagrams showing the method of planting. We are pleased to see an absence of the absurd butterflies and other objects which have in some cases brought this style of decoration into ridicule.

"**LES PLANTES D'APPARTEMENT ET LES PLANTES DE FENETRES**."—Under this title M. D. Bois has published a handy little volume on window plants. The first part comprises some elementary notions as to the conditions favourable or unfavourable to plant life, the ordinary cultural operations, and the like. Some useful hints are given as to the purchase of plants in the public markets or flower-shops. Descriptive notices of suitable plants are supplied, together with a glossary of terms and an alphabetical index. The work is published by J. Baillièrre et fils, 19, Rue de Hautefeuille, Paris, and for all to whom the language presents no difficulties we commend it as a very serviceable little book.

FOREIGN CORRESPONDENCE.

BUENOS AIRES.

With this I send an Oak plant, with a few details respecting it, thinking that a record of the rapidity of growth, compared with the growth of same plant in the "old country," may be of interest to your numerous readers. The acorns, from one of which the accompanying plant was produced, were gathered with others in the month of March, 1890, and sown on the 12th of the following month (April); the plants appeared above-ground towards the end of the following September. During the months of October and November we had some severe frosts (unusually severe for this locality), consequently the plants were cut down several times, but "broke away again." Compared with other seasons, the past has not been one at all conducive to rapid growth, being extremely

dry until quite late in the season; but the accompanying plant when pulled from the seed lines yesterday measured, from the point of the roots to point of growth, 7 feet 1½ inch.

We have here: common Ash, seeds of which were sown in October, 1887; present measurements:—height, 15 feet 8 inches; circumference, 1 foot from the ground, 14 inches. *Carolina Poplars*, which were put in as cuttings (where the trees now stand) in July, 1886, and were headed back in July, 1890, stood from 40 to 50 feet high, and in circumference were 20 inches; some of same trees were cut down, sawn into boards, and boxes made. *Lombardy Poplars*, four years from cuttings, 45 feet high, circumference 30 inches. *Eucalyptus globulus*, sown in October 1887, present height 42 feet, circumference 20 inches. *Golden Ash*, budded on the common Ash in February, 1889, bud started in the second week of the following November, and by the end of March following had made 7 feet 10 inches. *Casuarina stricta*, not yet four years from seed, are over 17 feet high and 12 inches in circumference. Apple trees, only four years from grafts, are giving good crops of fruit, fruit large and sound, but not so weighty or such good flavour as our English Apples. A great many British forest trees do well here. Horse Chestnuts, Beech, and Sycamore very indifferently. What would some of the home gardeners think of budding *Roses*, and in five weeks having a growth of 17½ inches?

We have, of course, a very long growing season and a glorious climate; with some trees growth commencing early in September, older plants of Oak and Ash and other trees not making any movement until well into October. Growth generally begins to decline towards the end of April, excepting the *Eucalyptus* and *Casuarina*, these continuing to grow well into May and frequently into June. Our hottest day the last two years has been 95° Fahr. in the shade. *Château Parry, Quilmes, Buenos Aires, S. America, June 16, 1891.*

PLANT PORTRAITS.

AGANISIA IONOITEBA, *Nicholson*.—Originally known as *Koelensteinia*. *Lindleya*, t. 287.

ANOGANTHUS BREVIORUS, *Garden*, July 18.—A yellow-flowered *Amaryllis*, native of Natal.

ARCTICUS ARIZONICA, *Garden and Forest*, p. 317.

CALADIUM ADAMANTINUM, *L. Linden, Illustration Horticole*, t. 132.—A Peruvian importation, with long-stalked, hastate leaves, deep green, with white veins, and numerous small white spots.

CATTLEYA DOWIANA AUREA, *Orchid Album*, t. 132.

CATTLEYA LABIATA VAR. *SCHROEDERII*, *Garden*, July 11.—Segments lilac, lip also deeper lilac, with a central orange blotch.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—The earliest house should now be gone over, if at all thick, and abundance of light admitted into the trees, so as to ripen the wood. Many of the shoots that have borne fruit should have been removed early, to give room for next year's wood to get well ripened; and though removal of all useless wood is now recommended, shortening back must be deferred for a time, as the removal of too much wood at one time causes the shoots to make new growth—but much may be done by removing branches not required, and early-fruiting wood that may have been left. If at all dirty, no time should be lost in thoroughly cleansing with sulphur and water or tobacco-water and soft-soap, with a little sulphur, all well mixed together. The roots should never be allowed to get dry, so that a mulch of decayed manure will check evaporation. Now is a good time to make a note of varieties, and to determine what removals may be required, as it is often necessary to lift young trees that grow too much to wood; these must get attention as soon as possible after the fall of the leaf. In Peaches for early fruits there is a wider range than in Nectarines. I will give a list

of what I have found the best early next month, so that new additions may be made if required.

THE SUCCESSIONAL HOUSES that have had the fruits just cleared should get a thorough soaking of liquid manure, removing all old wood that has borne fruit, and thinning as recommended for the earlier trees, giving a good mulch of decayed manure, and syringing daily, and also cleansing if red-spider be present. Give abundance of air in those houses that do not get plenty of sun, and a little warmth in the pipes to assist in finishing up the wood. In modern houses with a south aspect, and the foliage kept thin, this is only necessary with the latest trees.

LATE HOUSES will now be giving plenty of fruits, and these must get sufficient moisture at the roots to prevent premature ripening. The syringe must also be kept quiet when the fruits commence to soften; much can be done to retard or hasten the fruit by ventilation, and the use of fire-heat. Abundance of air greatly adds to the flavour of the fruit, but too much at night must be avoided by closing the front ventilators, as cold draughts prevent the fruits swelling. A mulch of spent Mushroom-manure will assist the roots and keep them from drying. The wood must also be removed as soon as the fruits are gathered, as advised for earlier houses. In unheated Peach-cases much can be done to forward the fruit by closing early, and by careful airing in dull weather, for if not pushed forward, the crop comes in with the early varieties on a south wall. Trees in pots that have borne crops must not suffer for moisture; these may be removed to an open sunny position, the pot plunged up to the rims, and the surface covered with decayed manure, and in dry weather given a good syringing nightly with the garden engine, and kept clean. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

DWARF AND SCARLET RUNNER BEANS.—The early and late sowings in light soils should be mulched heavily with manure, but on heavy soils less so. Water them thoroughly when the soil becomes dry. Beans of all kinds require good rich soil, and should not at any time be allowed to suffer for want of water, or the flowers will not set well. The plants should be kept in vigorous growth by picking all pods when large enough, allowing no seeds to ripen; it is desirable to save seed from any special variety, the smallest pods should be removed, retaining the longest and best-shaped ones only. In case of a glut, the green pods may be kept in a fresh condition for several days by putting the stems in vessels of water, and placing them in a cool shed.

To prolong the supply of French Beans as long as possible, seeds should be sown in 8-inch pots, five or six plants in a pot, and sufficient space left for earthing up. The pots may be stood out-of-doors until established, removing them into suitable quarters later.

LETTUCES.—Sow the Hardy Cabbage varieties on raised beds to stand the winter; and again, a fortnight later, another sowing should be made. These, if afforded some slight protection in very severe weather, will come into use long before spring-sown ones. When the plants are large enough, they should be thinned sufficiently so as to stand clear of one another. The thinnings can also be pricked out in other beds.

EARTHING CELERY.—The main crop should soon be ready for the first earthing. This is best done in three times, at intervals of a fortnight, and when the plants are perfectly dry; all small leaves and side shoots should first be removed, and the tops drawn tightly together with a piece of matting just under the green leaves. This must not be tied too low, or in any position that will cripple the growth of the young heart of the plant, as it should remain until after the second earthing. Be careful to ascertain that the plants and the soil at their roots are in a thoroughly moist condition before the soil is added. If worms and slugs are likely to be troublesome, a good dressing of lime and soot mixed should be given before any soil is placed around the stems. If it be necessary to give any more water or liquid-manure, it should be given a day or two before commencing to earth. The foliage and soil should also be in a fine and dry condition at the time of earthing, and the latter prevented from entering the centre of the plants. Where fish-guano or other artificial manure is applied, it should be sprinkled in the trenches, and incor-

porated with the soil in the first stages of earthing-up. If any heads are required for show purposes, they should be first wrapped round with brown paper before any soil is put against them, as a further preventive against discoloration. Care must be used not to earth too deeply the first time, as the young leaves must be allowed to continue their growth freely. The soil should be broken up with the spade, and pressed around the stems. In order to have it well blanched, and of good flavour, the light must be excluded from the stems as much as possible, and this will apply more especially to the last earthing.

Chervil, Radishes, and Mustard and Cress, should still be sown at short intervals if they are in constant demand. Herbs of the various kinds should, if not already done, be cut and slowly dried, and the required winter stock bunched, placed in paper bags to keep them free from dust, and hung up. Make plantings at intervals of Endive and Lettuces for autumn use. *C. J. Waite, Glenhurst, Esher.*

PLANTS UNDER GLASS.

HABROTHAMNUS—The varieties *H. carminata*, *H. elegans*, and *H. Newalli* make very useful plants for forcing during the winter, if they are properly prepared. Have the shoots cut well in during the summer, so that the plants have time to make young growths before autumn. Stand the plants out in the open on a bed of coal-ashes, from the present time to the third week in September, which will cause the young shoots to break strong and sturdily. When taken indoors, place them in a greenhouse; afterwards, bring them in heat as required. The larger the plants are, the more flowers they will produce.

CHRYSANTHEMUMS.—These will now require daily attention, in the way of tying in the shoots, and also disbudding. Plants which are intended to produce exhibition blooms should have all side-shoots pinched out as soon as they appear. Those which have filled their pots will require abundance of water at the roots, and the early varieties which have set their heads should be assisted occasionally with clear manure-water, or some well-tried fertiliser. Any plant which may have been potted late should be staked, so that no damage may be done to the roots later on. Syringe the plants overhead twice each day, when the weather is bright, to keep them in a healthy state.

INDIAN AZALEAS.—The latest of these should by this time have completed their growth, and if not already done, should be shifted from their growing quarters into the open air at once, so as to perfectly mature the young wood and develop the flower-buds for another season. Plants which have been grown under the shade of Vines or Peach-trees, should have a gradual course of exposure to the full rays of the sun, lest the young foliage should become burnt, and a great check thus be given to the formation of the flower-buds. Keep a sharp look-out for thrips, as at this season of the year they increase very rapidly, and will quickly do irreparable injury to the plants, and on their first appearance, either fumigate, or thoroughly syringe the plants with a solution of soft soap and tobacco-water, and also syringe freely with clear water every evening when the weather is bright. Should any of the plants require re-potting, they should have attention at once. Fibrous peat of the best quality, also some charcoal, broken to the size of Hazel-nuts, with a liberal addition of silver-sand, will suit their requirements. Potting must be done thoroughly, and they will amply repay any extra labour bestowed upon them. Make the fresh material quite firm round the old ball, avoid giving large shifts, one clear inch around the old ball will be quite sufficient. After potting, stand them on a bed of coal-ashes and be careful to place them level, so that water can be equally distributed. *R. Milner, Penrice Castle, Swansea.*

THE HARDY FRUIT GARDEN.

PEACHES AND NECTARINES—These trees, although later than usual, have made good growth, the foliage being strong and healthy, and free from insects. The season being backward, every possible attention should be afforded the trees, especially late kinds, pinching back as fast as they appear all sublaterals. Keep the leaves from overhanging the fruit, and so fully expose each to the full influence of the sun. Lose no time in removing any of the shoots where too thick, cutting them back to two or three eyes, in case a fresh shoot may be required

another season for keeping the body of the tree filled with young fruitful wood. If the roots have been heavily coated with manure, no time should be lost in removing it, so that the sun may strike the soil direct, warm the roots, and help along the fruit. Do not over-syringe the trees, once or twice weekly is ample in dull sunless weather; but should the days be hot and dry, syringe more frequently, and not later than 2.30 p.m. Midseason sorts, such as *Noblesse*, *Royal George*, *Stirling Castle*, *Goshawk*, &c., should, if the crops be heavy, receive attention at the roots, and if the wood is weak a few more fruits may be taken off, and then feed well with liquid manure. All cropping should in a great measure be regulated according to the strength and vigour of the trees. Dymond is again this season cropping well, and is, in my estimation, one of the best Peaches ever sent out. Early sorts, such as *Alexander*, *Waterloo*, *Amsden*, *Early Beatrice*, will be over, and the trees should not be neglected, but partly pruned, this time removing wood which has borne fruit, refilling with shoots trained for that purpose; also syringe once or twice weekly, and let this be thoroughly well done, while a few applications of liquid manure at the roots will be a great help to large and fruitful trees, especially if the soil is light and dry.

Earwigs, in many gardens, will be found very numerous and troublesome, eating the fruits at the points, and thus spoiling probably the very best and most handsome Peaches. They should be trapped by placing pieces of Bean stalks, or anything hollow, in 6-inch lengths at intervals amongst the branches. Earwigs find their way down these, and should be blown out over a pail of hot water daily. With constant attention these creatures may be kept in check, and the fruit spared from injury.

APRICOTS.—The laterals must be pinched, and all the leading shoots made secure to the walls. After the fruits are ripe and gathered, lose no time in bringing the garden-engine into use, thoroughly washing the leaves, and dislodging any insects. Do not be led astray by the frequent rains; the borders are apt to get very dry where sheltered. If the borders are well made, and the trees are in good bearing, a deluge of manure-water will also prove very beneficial to the trees, and help them to plump up strong fruitful buds; in the meantime, soil and other material should be got in readiness for top-dressing and renewing all fruit borders in need of it. *H. Markham, Mereworth Castle, Maidstone.*

THE ORCHID HOUSES.
